The essential oil and theine of tea are the desirable elements; the tannin which by hardening albumen interferes with the process of digestion is to be avoided. The one is avoided and the other secured by the manner in which tea is made. In order to make a good cup of tea we must first have good tea, small leaves are better, and tea should be kept closely covered in jar or tin.

Use earthen-ware tea pot, never tin. The tea pot must be clean and dry. Never leave liquid and leaves in tea pot between meals and never drink liquid that has stood more than five or six minutes on leaves.

Freshly boiling water must be used so that the oxygen is not expelled.

Tea Recipe

1 teaspoon tea to one cup of water.

Pour boiling water over tea and stand where it will not boil, from three to five minutes.

Flattering to the Original

But Imitations Only Disappoint

There are many imitations of this great treatment for coughs, colds, croup, bronchitis and whooping cough. They usually have some sale on the merits of the original, but it should be remembered that they are like it in name only.

This is a facsimile of the package bearing portrait and signature of A. W. Chase, M.D.

BUILD CONCRETE SILOS

With the LONDON ADJUSTABLE SILO CURBS. Over 12,000 concrete silos have been built in Ontario alone. Send for catalog No. 10.

LONDON CONCRETE MACHINERY CO.,
Dept. E, London, Ontario.
World's Largest Manufacturers of Concrete Machinery

THE WINTER TERM
of the
Fredericton Business College
will open on
Monday, January 8th, 1917

Begin today to prepare for a good paying position by getting information regarding our courses of study, descriptive booklet of which will be sent on application.
Address,

W. J. OSBORNE, Principal
Fredericton, N. B.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.
Address

MRS. M. SUMMERS, Box 309
Windsor, Ont.

ACUTE COLDS AND THROAT TROUBLE

Soon Cured by

VENO'S LIGHTNING COUGH CURE.

Veno's is no ordinary cough mixture, but an absolute specific for every kind of cough, cold, or throat trouble. It is just wonderful how it cures those acute colds and throat troubles that are so prevalent at this season. A few doses of Veno's and you are well again, because Veno's is a real lung and chest healer, and enables you to throw off the trouble at once. There is no dope in it, so you can take it freely, and give it to children, too. Price 30 cents and 60 cents, from druggists and stores throughout Canada.

Advertise in the Maritime Farmer

tea infusion, the finest tea gives a light color even after long steeping; it is tannin that makes tea dark. When strength is desired, secure it by adding more tea, not by longer steeping.

If one is fond of the genuine flavor of tea, nothing will be added to the infusion. The addition of cream and sugar is an English custom; that of slices of lemon a Russian usage, while candied cherries in tea is an American innovation.

COCOA

"Food of the gods."

In dealing with tea and coffee we are considering articles that in themselves have absolutely no food value, articles that are prized simply on account of their stimulating qualities but in all preparations made from cocoa beans we have a food of high nutritive value. Cocoa contains starch and some fat. What corresponds to theine is called theobromine, meaning "food of the gods." On account of the high nutritive value of a cup of cocoa or chocolate it makes a substantial addition to a light meal, as at breakfast or luncheon.

Baron Von Liebig, one of the best known writers on dietetics, says: "It is a perfect food, as wholesome as delicious, a beneficent restorer of exhausted power; but its quality must be good and it must be carefully prepared. It is highly nourishing and easily digested, and is fitted to repair wasted strength, preserve health and prolong life. It agrees with convalescents; with mothers who nurse their children, with those whose occupations oblige them to undergo severe mental strain, with public speaker and with all those who give to work a portion of time needed for sleep. It soothes both stomach and brain, and for this reason, as well as for others, it is the best friend of those engaged in literary pursutts."

Cocoa Recipe

4 tablespoons cocoa. 3 tablespoons sugar, pinch of salt, 2 cups water, 2 cups milk.

Mix cocoa, sugar and salt. add water and boil ten minutes, add scalded milk. Beat scum up with egg beater do not skim it off as it is the most nourishing part of the milk.

The cocoa and sugar are mixed to prevent lumping, and the mixture is boiled to cook the starch. In order to bring out the full, fine flavor and to secure the most complete digestibility, the preparation must be subjected to the boiling point for a few minutes.

Some persons complain of being unable to digest chocolate in any form, and others say it is not nourishing. In these cases the chocolate they use is of bad quality or badly made; for good and well made cocoa or chocolate must suit every stomach which retains the sightest digestive power.

THE CHILD, THE PARENT AND THE SCHOOL

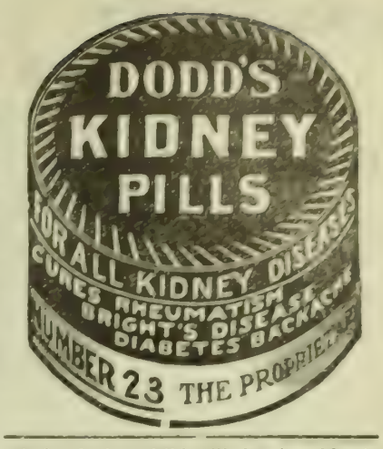
The up-to-date elementary school begins with the kindergarten. Games, songs, and children's sports make a joyous entryway into the grades. Flowers, fruits, leaves, grasses, butterflies, moths, toads, frogs, bats and birds, may be brought to the classroom and examined; or the children may go on expeditions to explore Nature's wonderland, making excursions to any spot of beauty near enough at hand. Farm animals may be visited on the nearby farms. Then on the return to the school the things seen may be talked or sung about.

However, the kindergarten only reaches the children in city schools, and only a very small percentage of our children have an opportunity to enter one. On the other hand practically all school children enter the grades. The time has passed when reading, writing and arithmetic should constitute a satisfactory education. Like the kindergarten, the elementary school must touch life; like the kindergarten, it must provide for child needs. Here and there schools are turning from the old methods of teaching spelling, multiplication, and syntax to the new methods of teaching children—yes, and teaching them those things which they need, irrespective of name.

The best of all is that the old time-honored studies may become full of interest if they are linked to life. For example, compare the old method of teaching geography with the new way. Once the child began with a memorized list of the names of capes, bays, peninsulas, continents, seas, and the like. To-day he may commence with the town in which he lives; or even the very school building itself, and its immediate surroundings. Maps are made of these, and the relative positions of nearby objects noted. Surrounding districts, with their rivers, hills, creeks, lakes, etc., are gradually included, broadening the mind of the child till he is able to grasp the significance of the larger formations of the earth's surface.

The old methods of teaching arithmetic led surely to a feeling well described in the old lines:

"Multiplication is vexation;



Weak From Birth

Harriston (Ont.) Child Saved by Dr. Cassell's Tablets.

MR. CORBY, HARRISTON P.O., ONT., writes:—"Just a few lines in praise of Dr. Cassell's Tablets. Our little girl was weak from birth, and though we tried doctor's medicine and other things she got no better. She just lay in her cot and cried, and neighbours all said we could not save her. Then I read about Dr. Cassell's Tablets. I said to my wife, 'while there's life there's hope'; we will try these Tablets. We did, and from the first box we could see a change in the child. She seemed to rest more comfortably, and slept well at night. We kept on giving Dr. Cassell's Tablets till she was 18 months old, and now at three years I don't think there can be a healthier child in the whole Dominion.

Little Miss Corby.

The doctors said she had stomach trouble, and that her chances were small, yet Dr. Cassell's Tablets cured her. They have been worth their weight in gold to us, for we were just giving up hope of saving our little daughter. I don't think there is any other medicine for children like Dr. Cassell's Tablets. I may say my wife has taken them for nerves, and they have built her up splendidly. Publish this letter if you like: it may help others as the Tablets helped us."

Bright, healthy, happy children, full of life and activity—every mother wants her babies to be like that. Are yours? If they are not, if they are weakly or fretful we say it in all sincerity—the surest way you will ever find to build up strength and vitality in their little frames is a course of Dr. Cassell's Tablets.

Dr. Cassell's Tablets

FREE SAMPLE.

On receipt of 5 cents to cover mailing and packing, a generous free sample will be sent at once. Address: Harold F. Ritchie & Co., Ltd., 10, McCaul-street, Toronto.

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-Spasmodic, and the recognised remedy for

Nervous Breakdown	Sleeplessness	Mal-nutrition
Nerve Paralysis	Anæmia	Wasting Diseases
Infantile Weakness	Kidney Trouble	Palpitation
Neurasthenia	Dyspepsia	Vital Exhaustion

Specially valuable for nursing mothers and during the Critical Periods of life

Sold by Druggists and Storekeepers throughout Canada. Prices: One tube, 50 cents; six tubes for the price of five. War tax, 2 cents per tube extra

Sole Proprietors: Dr. Cassell's Co., Ltd., Manchester, Eng.

UNSIGHTLY PIMPLES

COVERED HIS FACE.

B. B. B. Cured Him.

All diseases and blemishes of the skin are caused by the blood being in an impure condition

The best blood cleansing medicine on the market to-day is Burdock Blood Bitters, a medicine that has been in use for over 40 years, so you do not experiment when you buy it.

Mr. Lennox D. Cooke, Indian Path, N.S., writes: "I am writing you a few lines to tell you what Burdock Blood Bitters has done for me. My face was covered with pimples. I tried different kinds of medicine, and all seemed to fail. I was one day to a friend's house, and there they advised me to use B. B. B. so I purchased two bottles, and before I had them taken I found I was getting better. I got two more, and when they were finished I was completely cured. I find it is a great blood purifier, and I recommend it to all."

B. B. B. is manufactured only by THE T. MILBURN CO., LIMITED, Toronto, Ont.

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

A MESSAGE TO WOMEN!!

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:

Mrs. M. Summers, Box 309 Windsor, Ont.

Division is as bad;
The rule of three it puzzles me,
And fractions drive me mad."

In many schools, arithmetic is first taught quite naturally. Some teachers organize games in which some children play while others keep score. Under the stress of the most gripping of impulses—the desire to win—these scorekeepers learn addition and subtraction. Later on they take up practical problems such as measuring the room, calculating cost and profits of farming operations; household arrangements, etc., etc. One teacher made a full week's work for her whole school in arithmetic, grammar, spelling and composition, as well as drawing, out of the question as to how a farmhouse, and particularly a farm kitchen, should be arranged and furnished. The children were told to describe the utensils they saw used at home, and to learn the relative cost and efficiency of such utensils. Other farm buildings and farming operations were taken up in turn. The raising of various crops and the handling of live stock of all kinds may be made to give endless variety to the studies in any of our rural schools.

English is one of the most important of our subjects. We buy with it, sell with it, adore with it and protest with it. The best schools have, therefore, given English—real English—a first place in school work. Pictures may be distributed, bearing on the season or event near at hand, such as Christmas, Thanksgiving, Hallow'een, or anything of importance, and the children may be asked for a story or poem on the picture. In one school where this was done just before Hallow'een, one of the boys wrote, referring to his picture, which was of a witch on a broomstick, with a cat at her side, riding toward the moon:—

"The witch's cat was as black as her hat,
As black as her hat was he;
He had yellow eyes which looked very wise,
"And he sailed high over the trees."

In this same room a girl 9½ years of age wrote a poem entitled "The Moonlight People." Here is one stanza:—

"When the stars are twinkling,
And the ground with snow is white,
And we are just awaking
To see the morning light.
Little moonlight people
Are dancing here and there;
O'er a snow-white carpet,
Dancing everywhere."

In some schools the children write books. They choose a title, and each week the child writes something in the book, illustrating the text with drawings, decorating the margins with water colors, painting a tasteful cover, and at last, as the product of a year's work in English, taking home a book written, hand painted, hand illumined, covered and bound by the author. In other schools the children are encouraged to read at home and tell in class Aesop's Fables, Bible stories, Greek legends, Norse legends, and any other stories that the teacher thinks appropriate. Sometimes a teacher reads a chapter aloud to little ones not far enough advanced to read much at home. In this way the "Hoozier Schoolboy" was read to a whole school in Saskatchewan. Every week a chapter was read; and during the week the children wrote exercises based on what they heard. They became intensely interested, and improved wonderfully in composition.

Old methods of teaching physiology, which meant a memorizing of the names of muscles and bones, symptoms of diseases, and so on, has been replaced in many schools by a physiology which aims to teach that the body is worth caring for and developing into something to be proud of. Beginning with Nature study and elementary science, the hygiene course emphasizes first the care of the body; then public health, and private and public sanitation.

Domestic science can be taught successfully here where nearly all the children bring cold lunches. Let trustees supply the school with a tiny kitchen. No great cost is necessary—just a small room separated from the main building, and containing a cheap cooking stove as its one essential. Here hot lunches may be prepared each noon hour by

This Washer Must Pay For Itself

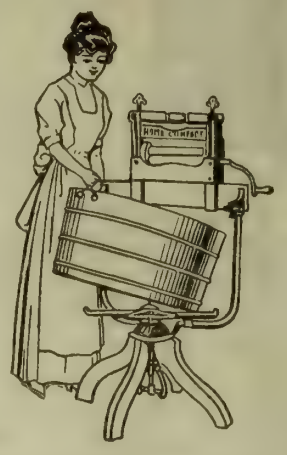
A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right, but pay me first, and I'll give you back your money if the horse isn't alright."

Well, I didn't like that, I was afraid the horse wasn't "alright" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now this set me thinking.

You see I make Washing Machines——the "1900 Gravity" Washer.

And I said to myself lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.



Our "GRAVITY" design gives greatest convenience, as well as ease of operation with quick and thorough work. Do not overlook the detachable tub feature.

But I'd never know, because they wouldn't write and tell me. You see, I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it doesn't wear the clothes, fray the edges nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for the people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight, too. Surely that is fair enough, isn't it?

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that on washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

State whether you prefer a washer to operate by Hand, Engine Power, Water or Electric Motor. Our "1900" line is very complete and cannot be fully described in a single booklet.

Nineteen Hundred Washer Co., 357 Yonge St., Toronto, Ont.,

From Up Among The Yukon Snows

COMES ADVICE TO SUFFERERS TO USE DODD'S KIDNEY PILLS

Glacier Creek Lady Says They Have Been Her Stand-by for Sixteen Years and She Has Never Known Them to Fail.

Glacier Creek, via Dawson, Yukon, Can. (Special.)—"North of fifty-three where doctors are long distances apart and those remedies that are a very present help in time of need are the reliance of the settlers, Dodd's Kidney Pills have established an enviable reputation. Hear what Mrs. A. Armstrong, a well-known resident of this place, has to say of them:

"Dodd's Kidney Pills have been my stand-by for sixteen years," Mrs. Armstrong states. "Both myself and my family have the greatest faith in their medicinal qualities. When any of my friends complain of even a headache I treat them with Dodd's Kidney Pills and they never fail to do good.

"It always gives me pleasure to say a good word for Dodd's Kidney Pills."

Dodd's Kidney Pills cure all kidney ills from backache to rheumatism, Bright's disease and heart disease. These troubles come from sick kidneys. That's why Dodd's Kidney Pills cure them.

LADY'S SHIRT WAIST.

By Anabel Worthington.

Even in competition with the afternoon blouse the simple, tailored blouse always shines out as an indispensable garment. It is a perfect boon to the business woman and to the housekeeper who discards her morning work dress for the waist and skirt costume, for walking, shopping or in which to spend the afternoon at home.

The smart blouse in the picture is ideal for combining with one of the new semi-tailored skirts. It is of full, comfortable cut, with the back extending over the shoulders at front to give the popular shoulder yoke effect. The waist fronts have their fulness gathered at this point, giving a graceful line to the garment. The broad collar is as collars of the times are—deep, and straight across the back, a correct finish for the V neck at front. The well liked front closing is with pearl buttons. Sleeves set in without fulness may be in either three-quarter or full length; the flare cuff, button trimmed, gives snappy style when the long sleeve is chosen.

The shops are just full of new spring fabrics for blouses and the wise woman will buy a quantity for her sewing room before the best are carried away by some one who is after the first pick. Linens are good; voile, satin and like fabrics are other favorites.

The waist pattern No. 8,143 cuts in sizes 36-42 bust

To make in size 36 requires 2⅞ yards of 36 inch material.

To obtain the pattern send to the office of this publication.

PEDLAR'S
"GEORGE"
SHINGLES

ARE you really saving money by neglecting to re-shingle that barn roof? You know that each additional patch lessens the value of your building. You know each widening leak means rotting, loosening shingles and early decay. You know that only by Pedlarizing your roof can you get enduring freedom from repair and rot. Pedlar's "George" Shingles bring you the durability and wearing qualities of steel at a price, when laid, about that of a good wooden shingle roof. A Pedlarized roof will last for generations, protecting you at all times from the danger of lightning and fire. The "Right Roof" Booklet M F telling you all about steel shingles and how to lay them, is free. Write to-day.

How to Order Patterns.

Order by number, giving age or measurement as required, and allowing at least ten days to receive pattern. Also state in which issue pattern appeared. If two numbers appear for the one suit, one for coat, the other for skirt, thirty cents must be sent. Address Fashion Department, "The Maritime Farmer, Sussex, N. B. Be sure to sign your name when ordering patterns. Many forget to do this.

Positively no patterns will be sold under 15 cents each, owing to advance in cost of same.

When ordering, please use this form:—

Send the following pattern to:

Name .....

Post Office.....

County .....

Province .....

Number of Pattern.....

Age (if child or misses' pattern).....

Measurement—Waist .....Bust.....

Date of issue in which pattern appeared. .....

the teacher and pupils. The materials may be brought from home, and much pleasure and profit be derived from the cooking, serving and eating of hot lunches instead of cold. Children will be much healthier and happier. One teacher carried this plan out very successfully on the common upright heater that is usually found in all our rural schools. But this involved much inconvenience, waste of fuel, and over-heating of the classroom during sultry summer weather.

The new education is broader than the old because it adopts any study which seems likely to meet the needs or wants of any child. The storehouse of the mind is to-day unlocked with educational keys of which educators in past generations scarcely dreamed.

It is a long step from the school of "reading and 'riting and 'rithmetic taught to the tune of the hickory stick," to the school which aims at the education of the whole child; where the school authorities write mental and physical, hand and head, vocation and recreation, into one complete system.

This result is accomplished, first, by engaging experts to teach special subjects; second, by abolishing grade promotions and permitting each child to advance in each subject when he is ready to do so; third, by keeping the school open morning, afternoon and evening during practically the entire year; fourth, by making the work so attractive that children will prefer the school to any other place.

In many parts of the west, grown-ups will be glad to attend classes in the evenings. It is surprising how many young men and women there are in our rural districts who threw away their chances of an education when they were boys and girls; and who now see the need of at least a little learning. These young people would feel ashamed to be seen in classes with little children; yet they would gladly join evening classes composed of young folks of their own age.

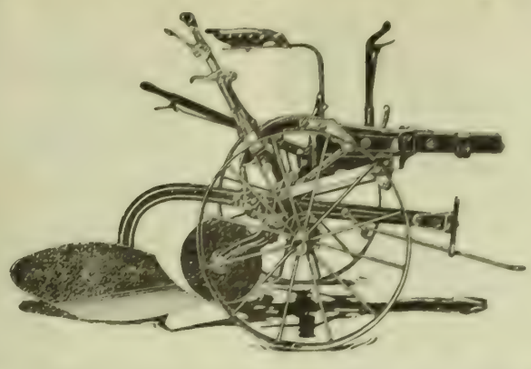
A "Parent's Association" could and should be formed in connection with every rural school. This can be best accomplished by the teacher herself. She should place herself in close touch with her school community and its interests by acquainting herself with the parents of her pupils and bringing them to the school. The first meeting may be announced by placing attractive posters in the rural store, or at corners and cross-roads, and also by written or verbal invitations to individuals.

A practical plan for a first meeting is to include a short but attractive programme by the children; a talk on some phase of agriculture by someone from some agricultural college or society, or by some respected farmer; and then have a short time for social intercourse and light refreshment. While everyone is in good spirits, the teacher speaks of the value of having a "parent's day" at least once a month, and tells of good results that invariably follow such a course. Then, while the interest is at its height, a president, vice-president, and secretary are decided upon by those present; a general plan of the work of such an organization is presented by the teacher, who also suggests that an executive committee be appointed for the planning and arranging of meetings and programmes.

Some question that will be profitable for discussion by parents, are:—

(1) Keeping the boy on the farm;
(2) Social life for country girls;
(3) The physical condition of our children;
(4) Understanding our children;
(5) The consolation of schools;
(6) How to improve the school library;
(7) The home library for rural homes;

Good Plowing Done Here



Take a simple type of two-wheeled sulky plow like the Oliver 26, equip it with a suitable bottom, and put it into the hands of an Eastern Canadian plowman. There is an unfailing recipe for good plowing. The Oliver 26 sulky handles like a two-wheeled cart. It has a pole shift that changes instantly the landing of the beam, making it as easy as can be for the operator to straighten crooked furrows, to turn short corners or to plow side hills. The land wheel has a range of lift that insures good work on rough ground, around dead furrows, and in finishing out a land. No plow made works better on rough, uneven land or can be backed more easily. It has a horse lift that eases the work of the plowman without tiring the horses. Taking it all together, there is no handier plow than this sturdily built Oliver 26.

Other Oliver plows from engine and riding gangs down to walking plows, complete a line in which you can find any particular plow you may happen to need—a plow that will help your reputation as a good plowman and good farmer—at a price you can afford to pay. May we send you our folders telling all about Oliver plows for Eastern Canada? Write to the nearest branch house.

NOTICE

TO

Page Fence Company Customers

We think it is only fair to our friends who have stood by us when they could get plenty of cheaper grade fence almost anywhere, that we advise them of the situation.

Deliveries of fence this year will undoubtedly be delayed on account of scarcity of material. While we are doing our utmost to secure such a stock in hand that we can fill all orders from at least our old customers, we cannot, at this writing, guarantee promptness in all cases, and hence we suggest that you place your fence requirements with us as far in advance of the actual time of need as possible.

Our new catalogue, and also new cash price list, showing prices direct to user, ready for mailing on request.

Hosts of topics will present themselves to a live committee once interest is aroused to the value of the school itself.—Brenda E. Dow.

DOES OATS SUPPLY WHAT CORN CANNOT

(Continued from page 266)

ceived an equal weight of ear corn. Mixed clover and timothy hay was the roughage. Between the corn-fed and oats-fed geldings no difference in spirit and endurance could be observed. Quite as significant was the fact that there was no difference in changes in weight.

The difference in the cost of feeding was so material as to seem a vital consideration to the cornbelt farmer who heretofore has "believed in oats." With corn at 80 cents the bushel, oats at 60 cents and hay at $10 to ton, it cost $85.65 to feed a corn-fed horse for 48 weeks, and $122.19 to feed his oats-fed teammate. Considering the relative prices of the two grains over a long period of years, the Ohio statesmen say that corn may be substituted for oats for work horses at a material saving. They recommend that corn be given a large place in the horse's ration whenever market conditions warrant its use.

Doubtless there will at this time be some sticklers for oats who will have something interesting to say about the application of the advice to conditions in 1917.—Breeders' Gazette.

THE TRUTH

(Continued from page 267)

of our bright, intelligent, young men who is making good. He has been a successful exhibitor and breeder of a great many of the standard varieties of poultry—mark the work breeder. He breeds his winners. He has satisfactorily judged poultry at shows of as great or greater merit than last fall's show at Charlottetown. Tom Latham has been breeding and exhibiting for over twelve years and in that time he has learned a lot about the fancy points of poultry, and when he judges birds he judges them as he finds them, not on the possibility of what they may be several months hence.

If the reader will take the trouble to compare the prize winnings at Charlottetown and Moncton he will find that the placings, and that in the latter case, under one of Canada's foremost judges, were identically the same, with the exception of the White Leghorn Pullet section, where the second prize Charlottetown pullet was placed first. I have it on good authority that this pullet was imported, sure to win, but was not mature enough nor in shape to win at Charlottetown and her owner was informed by the judge to fit her up a little and that her chances of winning first place would be good at the Maritime Poultry Show. Pretty good judgment for an "amateur" Eh! What!"

There is a class of exhibitors who can never see beyond their own flocks and the Maritime Provinces is not immune form them. Tom Latham can always give good reasons for his placings and when squealers like Maritime, raise and show as many birds as Tom Latham has, they will learn to take their just rewards, be they to their liking or not, in good grace. That Tom Latham's placings at Charlottetown were upheld at Moncton by the other judge, speaks well for his judgment.

As I know Tom Latham, he cannot be bought or coaxed to do crooked judging. He is open and above board and no trickster need try it on.

Tom Latham is also a breeder of Jersey cattle and Standard Bred horses. In the latter class he has been successful in wnning the female championship diploma on more than one occasion at Halifax, Charlottetown and Amherst, with his Harriet King. Hs judgment is sound and stable and cannot be influenced one bit by professional kickers, and is entitled to a seat in the assemblage of professional poultry judges.

Thanking you for my intrusion on your valuable space to say a word for one of our progressive Maritime boys,

I remain,

FAIR PLAY.

TO TEST YOUR OWN SEED

In the Seed Laboratory grain is tested to determine the percentage of vital seeds by placing one hundred kernels between blotters, keeping them at a suitable temperature and supplied with the proper amount of moisture in special germinating chambers. The results of such a test show what proportion of the seeds are vital, but a more accurate idea of the value of the grain for seed could be gained from a soil test. Such tests are not practicable in a laboratory where thousands of samples are under test at one time.

Any one can test seed for himself by putting one hundred seeds taken "just as they come" from the grain he wishes to test, in soil in a flower pot, box or other convenient receptacle, and keeping it moistened, but not wet, in some place where it will be not too warm in the day time, and where it will be cooler, but will not freeze, at night; the alternation of temperature favours germination. By noticing the number of plants produced, whether they come up quickly and are strong or weak, one can determine the suitability of the grain for seedling purposes more accurately than from the results of a test which he does not use. If seed that is known to be of strong vitality can be planted under exactly the same conditions as the seed whose vitality is being determined, the test will be more valuable.

Cleaning grain over a good fanning mill to remove from one-third to one-half of the bulk including all the light, shrunken and immature seeds, will greatly improve its quality as seed. Seed Branch, Ottawa.

Baby's Own Soap

The creamy lather of Baby's Own Soap leaves the skin cleansed, softened and slightly and deliciously fragrant.

Use Baby's Own Soap with Warm water and rinse well,—and the most sensitive skin will never show irritations or become chapped.

Imitators refuse to use the expensive natural flower extracts and pure vegetable oils which are the basis of the success of Baby's Own Soap, THE family soap of Canada.

Sold almost everywhere.

DR. SPARLING VS. THE FARMERS

In a recent issue of The Ottawa Citizen, Margaret Graham Horton, who is a sister to Mrs. J. R. Semple, Brule, N. S., replied to a denunciation of the farmers of Canada as follows:—

"Editor Citizen: The Rev. Dr. Sparling's denunciation of the civil servants of Ottawa having been ably and forcibly answered by Mr. O'Hara in your issue of this morning, I would like to direct the attention of all fair-minded citizens to another sermon preached recently by the same clergyman. Unfortunately, the class denounced on New Year's eve, a class usually figuring in pre-election oratory as "the backbone of the nation," by city folk the least understood, the most misjudged class of our whole population, have had as yet no city spokesman to defend them from the cry of "shame" hurled at them by the reverend gentleman.

"When Dr. Sparling says, "The farmers of Canada ought to be ashamed of themselves for not producing bigger crops during the past year," he quite evidently knows not whereof he speaks. In what part of Canada could Dr. Sparling have lived last summer not to be aware of the unusual weather conditions? Did he know nothing of the torrential rains which fell at a time when the land required sunshine, rains which in some places became swollen streams, washing out twice planted or sown seed? Did he never read of the frosts, the hailstorms, the hot, dry winds in the prairie provinces, or the long drought, burning to the earth the late-sown crops in the eastern provinces? Was he so occupied with the morals of the civil servants as to render him oblivious to these facts? Any of the polite—even if sinful—officials of the Department of Agriculture would, if Dr. Sparling had taken the trouble to enquire, have given him such information as would have saved him from the fate that inevitably awaits the public speaker who, in attempting to instruct his fellow men in their duties, completely ignores such troublesome details as actual facts.

"In addition to the above easily acquired facts as to the extraordinary climatic conditions which caused a shortage of from one-third to one-half of the average yield in all crops with the exception of hay, Dr. Sparling could also have learned that the acreage cultivated in 1916 was from ten per cent to twenty-five per cent less than in 1915.

"From the obliging—though, I presume, also sinful—officials of the Militia Department, I learn that 45,543 Canadian farmers have already enlisted. Repeat those figures to yourself, Dr. Sparling, and say if you think 45,543 men can be taken from the production of food without affecting the output?

Dr. Sparling suggests that the "soft-handed men in government offices be sent to work on farms." Will he not offer the services of his own soft-handed, non-producing profession? I am assuming that, since pounding the pulpit with the fist is no longer fashionable, the ministry may be included in the soft-handed class.

"City people desirous of understanding the sources of our food supplies and the difficulties attending their production should attend the lectures to be given at the forth-coming stock and poultry show by a number of specialists in scientific agriculture.

"Dr. Sparling is no doubt familiar with Robert Louis Stevenson's Christmas sermon. I quote:

"One person I have to make good;
"that is myself. My duty to my
"neighbor is more nearly expressed
"by saying that I have to make him
"happy—if I may."

"If the clergy of this Canada of ours really wish to live up to the motto "I serve", let them close their churches for the summer months and go to work on the land. When they return to their pulpits in the autumn they will thus be able to give their people first hand and, let us trust, accurate information in regard to farmers and farming."

The foregoing is a masterpiece. The Rev. Dr. has been told a few plain truths that fit not only him, but many more hot air artists who are constantly dictating to the farmers what they should do, while they themselves are enjoying the even tenor of their war. There are two classes of criticisms—constructive and destructive. Dr. Sparling's brand is not the constructive kind. Quite in contrast to the constructive ideas advanced by Prof. Cumming and His Lordship Bishop Richardson at the recent annual meeting of the N. B. Farmers' and Dairymen's Association.

WORK OF P. E. ISLAND EGG ASSOCIATION

Reports submitted at the annual meeting of the P. E. I. Provincial Co-operative Poultry Ass'n recently held, show that 812.595 dozen of eggs, valued at $206.059 were sold through the egg circles. There are 50 on the Island and this is the largest co-operative egg association in Canada. There was an increase of over 200,000 dozens over 1915. The average price last year was 25 1-3c. The association has $20.000 in its reserve fund and no longer needs financial assistance from the provincial government.

The men behind the movement in Prince Edward Island are workers and it is quite evident that the poultrymen of the province are working with them. Is there not a big incentive in the foregoing figures to cause other communities to do likewise.

They all come out of the "BEAVER" FLOUR Barrel
Apple Pie and Hot Rolls for supper—Jelly Roll and Chocolate Cake and delicious homemade Bread for dinner —Puddings and Doughnuts, and Cookies and Raisin Bread — all at their daintiest and best when made of
BEAVER FLOUR
THE T. H. TAYLOR CO.
BEAVER FLOUR
MILLED OF BLENDED WHEAT

"Beaver" Flour is just as good for Pastry as for Bread. It is the product of Ontario winter wheat, blended with western spring wheat to increase the strength. "Beaver" Flour has the best qualities of both kinds of wheat—the whiteness, lightness, delicate flavour and perfect Pastry making qualities of Ontario winter wheat—coupled with the extra strength of western spring wheat. Being scientifically blended in exact proportions, the blended wheats are always the same in strength and quality—and so is the flour.

If you have never tried a blended flour, you cannot imagine what a difference there is between "Beaver" Flour and the usual western spring wheat flours. Get a sack of "Beaver" Flour at your dealer's, and try it for yourself.

Granny's Talk to Young Mothers

"Granny" Chamberlain

"Few young mothers realize the extent to which a cold lowers the system and makes it susceptible to disease. The majority of diseases arise from germs, but it is not widely known that a healthy system will repel their attacks.

Mothers should never allow a cold to run for 24 hours without attention. If this is made a rule there will be less sickness for young mothers to worry over. A good reliable medicine for coughs, colds, croup and bronchitis should always be kept in the home. You may say that you have no confidence in cough medicines, but that is because you have never tried

Chamberlain's Cough Remedy

the medicine that is thoroughly reliable and has stood the test of half a century. There is nothing in it unsuitable for even the baby.

Yours for Health,
—Granny Chamberlain

CUMBERLAND COUNTY POULTRY ASSOCIATION

The First Annual Meeting of the Cumberland County Poultry and Pet Stock Association was held Tuesday evening, Feb. 13th, 1917, at 8.30 o'clock in the office of Dr. E. L. Fuller, Blacks Block, Amherst.

Present: the President, Secretary-Treasurer and others.

After discussion and reading of correspondence obtained by the Secretary, it was moved by E. F. McKim and seconded by David Babcock, that the Association be formed. Passed.

Moved by V. G. Fuller and seconded by E. F. McKim, that the Association be called the Cumberland County Poultry and Pet Stock Association. Passed.

Moved by E. F. McKim and seconded by David Babcock, that the officers already elected be the officers for the ensuing year. Passed.

Moved by Wm. Mills and seconded by E. F. McKin that the Directors be not elected until the next meeting. Passed.

Moved by C. B. Chapman and seconded by Wm. Mills that a committee consisting of the Secretary and E. F. McKim and any other member they chose to work with them be appointed, to draft the By-Laws of the Association. Passed.

Moved by David Babcock and seconded by E. F. McKim, that the Secretary be authorized to write Mr. J. P. Landry and get names of Poultrymen in other parts of the County, also more information about joining the Nova Scotia Poultry Association. Passed.

Moved by E. F. McKim and seconded by Wm. Mills that the annual dues be $1.00. Passed.

Moved by Wm. Mills and seconded by E. F. McKim that the Secretary be authorized to get 100 membership cards printed. Passed.

On motion the meeting adjourned until further notice.

Following are the officers elected for 1917.

Hon. President—Mr. I. C. Craig, Amherst.

President—Mr. C. B. Chapman, Amherst.

Vice-President—Mr. W. W. Baird, Nappan.

Secretary-Treasurer—Mr. Victor G. Fuller, Amherst.

"BETTER POULTRY AND MORE OF IT"

FOR
HEADACHES, BILIOUSNESS
CONSTIPATION,

INDIGESTION

Nearly all our minor ailments, and many of the serious ones, too, are traceable to some disorder of the stomach, liver, and bowels. If you wish to avoid the miseries of indigestion, acidity, heartburn, flatulence, headaches, constipation, and a host of other distressing ailments, you must see to it that your stomach, liver and bowels are equal to the work they have to do. It is a simple matter to take 30 drops of Mother Seigel's Syrup daily, after meals, yet thousands of former sufferers have banished indigestion, biliousness, constipation, and all their distressing consequences in just this simple way. Profit by their experience. As a digestive tonic and stomachic remedy, Mother Seigel's Syrup is unsurpassed.

MOTHER SEIGEL'S SYRUP.

THE NEW 1.00 SIZE CONTAINS 3 TIMES AS MUCH AS THE TRIAL SIZE SOLD AT 50c PER BOTTLE.

IMPORTANCE OF SECURING VIGOROUS POTATO SEED STOCK

Experiment conducted at the Dominion Experimental Station, Kentville, N. S., with eight lots of Garnet Chili potatoes secured from different growers in 1915, show a variation in yield of from 36 bushels to 240 bushels per acre, or a difference of 204 bushels per acre in yield when grown under uniform conditions. Seed from these eight lots planted in 1916 yielded from 68 bushels to 212 bushels per acre, a difference of 144 bushels per acre. The respective positions of the different lots were changed very little in the second year, but the lowest yielding ones increased somewhat and the highest yield yas not so great.

Seed from fifteen others of this variety was planted in 1916 and the lowest yield obtained was 158 bushels and the highest 278 bushels per acre, a difference in favour of the best over the poorest of 120 bushels per acre.

Ten lots of pure stock of Green Mountain from different growers ranged from 180½ bushels per acre to 313 bushels per acre, a difference of 132½ bushels. Seventeen lots of Irish Cobbler ranged from 93 bushels per acre as the poorest to 235 bushels as the best, a difference in favour of the best yielding strain of 142 bushels. This would show that there may be as great a difference between potatoes of the same variety as there is between potatoes of different varieties, and that it is wise to secure stock from farms which have had high yielding crops. Because the Green Mountain has failed in giving a crop on a certain farm is not proof that this variety will not yield well there; it may have been due to low vitality in the seed stock. Such reversion in yield may have been due to disease, or adverse soil or climatic conditions which affected the crop at some time and it may be better to discard the stock entirely than to try to bring it up to its former vitality by selection.

Saves Money, Time, Labor

Electricity on the farm gives you the great advantage of clear, clean, brilliant, convenient light. But over and above all that, it saves money, time and labor. Delco-Light will shortly pay for itself in money and time saved.

With Delco-Light you save the time of cleaning lamps and lanterns. Housework and chores are done more quickly because of better light. In addition, Delco-Light power will do the milking, separating, churning, washing, water-pumping, feed-cutting. Allowing only 10c an hour for labor on your farm, Delco-Light will save you at least $127.40 a year.

Compact, Sturdy Motor

This is the Delco-Light Powerstand—a portable, efficient little electric motor that will run from any light socket. Runs all your light machinery and can be carried anywhere. Economical of current.

DELCO-LIGHT

ELECTRICITY FOR EVERY FARM

Easy to Operate
Economical, Safe

Simplicity is the key-note of the Delco-Light plant. It is easy to understand, easy to operate. A child can attend it. It consists of gasoline engine, generator, switchboard and batteries. Self-Starting, it stops automatically when its work is done. Gasoline consumption is small—and it is absolutely safe. Prices now—$375 for No. 208 and $450 for No. 216. After Mar. 1st—$390 for No. 208 and $465 for No. 216.

Write Today Get the complete Delco-Light story. We have published books covering every point. Send your name and address on a postcard.

THE COOPERATIVE PURCHASE OF FERTILIZERS

Editor The Maritime Farmer

In the December report of the Co-operative Extention Work in Agriculture and Home Economics, State of Vermont, conducted by The College of Agriculture University of Vermont, and U. S. Department of Agriculture, co-operating, Mr. Carrigan, one of the Extension Service County agents says:—

"A fertilizer campaign has taken "most of the time of the agent during "this month. Fifteen meetings were "held with a total attendance of 249. "In regard to the campaign Mr. Carrigan states—

"My purpose in launching a Fertil-"izer Campaign could be divided "under two heads. First, to get the "farmers to buying on a basis wherein "expended. Second, to get the farm-

"they would get more for the dollar "ers to use the fertilizer which they "do buy so they will obtain better re-"sults. I might say that so far as "this work has progressed it has been "comparatively successful. I talked "very strongly for the use of chemic-"als, and of course, found many local "agents in my audiences. In no case "could they submit prices that would "compare with the price of chemicals "if ordered at the present time. In "nearly every case the farmers ap-"pointed a local man to handle the "goods for them at a commission of "$1.00 per ton. I think this plan is "going to work out very well. One "man handling the goods in each com-"munity knows his neighbor, knows "local conditions comparatively well, "and is able to much more efficiently "deliver than if one man was handling "for the entire county. It is planned "when all orders are in to group them "and send them in from each receiv-"ing point. Thus in the towns sur-"rounding Bristol, which includes "Lincoln, Starksboro, Monkton, New "Haven and Bristol, all the orders "for these different towns will be sent "in and all the goods come to the "Bristol station in one shipment. "However, they are handled by dif-"ferent local men."

"I believe that probably 300 tons of "chemicals will be ordered in the "county this year, while last year "there were only about 30 tons order-"ed. This will be a saving to the "farmer of approximately $8 per ton. "It does not end here. After the "farmers once buy in this way, I be-"lieve they will adopt the plan per-"manently and that a fertilizer cam-"paign, especially from the buying "standpoint, will not be necessary "in later years."

This is very much along the line of work that is being done by The New Brunswick Agricultural Societies United. The farmers who purchase their fertilizer requirements cooperatively through their agricultural societies are effecting a big saving. This is the third season for the cooperative purchase of fertilizers in New Brunswick. Some local fertilizer agents are opposed to the movement, but many of our best thinking merchants and business men are ready and willing to help the work along. I have heard that at Sussex some of the merchants who own farms, purchase their own supplies from the society and assist in warehousing the goods when necessary. Our farmers appreciate such an attitude. The representative of a large ready mixed fertilizer plant, who attacked the home mixing of fertilizers at The Potato Growers Convention recently held at Woodstock, did not help himself or his firm by his tactics. We have heard of men who had large quantities of ready mixed fertilizers ordered previous to the meeting, and who cancelled their orders and ordered the chemicals for home mixing next day, after the above mentioned attack was made.

An Agricultural Sociey Member.

NEW BRUNSWICK FARMERS' AND DAIRYMEN'S ANNUAL CONVENTION

(Continued from page 257)

lotte, W. J. Bartlett, Waweig; Kent, Hector I. Cormier, Upper Buctouche; Kings, A. D. Northrup, Kingston; Madawaska, Dennis E. Daigle, Lacbaker; Northumberland, James Bremner, Chatham; Queens, Fred N. Fowler, Chipman; Restigouche, James E. Stewart, Dalhousie; St. John, Alex. Johnston, Upper Loch Lomond; Sunbury, A. M. Burpee, Burton; Victoria, S. Wright, Andover; Westmorland, Frank Trueman, Point De Butte; York, W. E. Palmer, Scotch Lake; Gloucester, W. J. Scott.

The new president took the chair and thanked the members of the association for the honor done him. It was moved that both parties at the next election in the province be asked to have a farmer on the ticket in each county. This was carried.

M. A. MacLeod and W. E. Palmer were appointed a legislative committee.

A hearty vote of thanks was tendered to the retiring president, G. E. Fisher for his good work, while in the chair.

Votes of thanks were tendered to the proper authorities for the use of the town hall and Normal School building.

S. H. McFarlane was appointed to procure entertainment at the sessions for next year. The session closed with the National Anthem.

A Day at the Experimental Farm

Friday, the closing day of the convention, was spent at the Experimental Farm, to and from which, thanks to the courtesy of the Department of Agriculture, free transportation was provided. A free sumptuous dinner was served by Mr. Hubbard to the two hundred or more visitors. Excellent talks on live stock were given by Prof. E. S. Archibald, Dominion Animal Husbandman, Ottawa, W. W. Baird and W. W. Hubbard. The farm equipment in [illegible] and live stock was closely examined. Here a little and there a little, information and ideas were gleaned that will help make the Experimental Farm become what it is intended to be, a real help to the farmers of the province. Votes of thanks were tendered to the various speakers to Mr. Hubbard for his courtesy and to the Dept. of Agriculture, before the farmers returned to Fredericton ready to disperse and go to their respective homes.

Pale Weak Nervous Children
SCHOOL days are anxious days for parents as well as for children.
At the most critical time in their lives girls, and boys, too, are subjected to the enormous nervous strain which examinations and excited ambition entail.
To many children this means nervous breakdown, with weakness of the digestive system, headaches, fainting spells, and a run-down condition, which makes them fit subjects for coughs, colds and contagious diseases.
The blood has become thin and watery, and the nerves are being starved, as is evidenced by weakness of the optic nerve and the necessity of wearing glasses
The rational treatment for this condition is Dr. Chase's Nerve Food. While gentle and natural in action, this food cure is wonderfully potent in restoring strength and vigor to the exhausted nervous system.
Experience with many thousands of cases has proven that this restorative treatment is just what pale, weak, nervous children need to build up their systems and to help them back to health and vigor.
Mrs. H. Houston, Highland Grove, Ont., writes: "While attending school my daughter became weak and very much run down. She was frequently troubled with bad fainting spells, and nothing we tried seemed to do her any good. We were advised to try Dr. Chase's Nerve Food, and did so with most satisfactory results. I am pleased to tell you that after using five boxes of the Nerve Food she was completely cured, and has had no return of the fainting spells."
This statement is certified to by Mr. Hamilton Houston, J.P.

A 21,000 LB. AYRSHIRE

It will be welcome news to Ayrshire men that a new record has been made in the Canadian Ayrshire world, by the cow "GRANDVIEW ROSE" 37030—owned by Shannon Bros., Cloverdale, B. C., that finished her test January 31st, last, with 21,423 lbs. of milk and 900 lbs. fat and is due to freshen early in April, this is equal to 1050 lbs. of butter. Her age at commencement of test was five years and twenty-two days.

This cow was bred by the Messrs. Shannon Bros., her sire being SPRINGHILL LIVE WIRE—27778—by LESSNESSOCK DURWARD LELY—(imp) 24758—(6746). Her dam was AUCHENBRAIN MAY (imp)—27779—by AUCHENBRAIN CRUSADER (6807). It will be seen that this cow's breeding is backed up by blood from the most productive strains in Scotland. GRANDVIEW ROSE is a large cow and true to Ayrshire type and form. The Messrs. Shannon Bros., are to be congratulated on being the first Canadian Ayrshire breeders to breed a cow to pass the 21,000 lb. mark in Record of Performance.

NEW IMPROVEMENTS IN THE DE LAVAL SEPARATOR

Since Dr. De Laval perfected the first cream separator in Sweden in 1878, there have been many improvements made in the construction and operation of these wonderful cream-saving machines.

In such improvements The De Laval Company, the world-wide organization built up on the foundation so well laid by Dr. De Laval and his associates, has always been the leader. In fact, most of the changes which have been effected in the gradual improvement of the cream separator during the past 40 years, originated in some one of the various De Laval shops, either in America or Europe.

The De Laval Company is now making announcement of a new machine which embodies many advantages over pervious styles, including a self-centering bowl, greater capacity, easier running and simpler bowl construction.

All these and other improvements are fully described in the new De Laval Catalogue which will gladly be mailed from The De Laval Company's office in Peterboro, Ont., upon request.

ANTI-FREEZING LIQUID FOR GAS ENGINE

Many anti-freezing mixtures and preparations for use in gas engines during the winter months have been proposed at various times. There is one, however, that is seldom mentioned, but which is claimed to be excellent in many cases. This is plain kerosene which will not usually freeze except in very low temperatures experienced in this country. One of the advantages of using kerosene as an anti-freezing liquid is that it has a tendency to clean any dirt which may have collected in the radiator or cooling tank of the engine. Also kerosene will not injure the majority of cooling devices.

One caution in the use of kerosene is that it should not be used in automobiles or other engines which have a tendency to run hot and boil the water; the reason for this is that kerosene boils much quicker than water and would be rapidly wasted if used in a hot engine.

There is no real reason why farm homes cannot be warmed as comfortably and evenly all through the winter as our city homes.

McLAUGHLIN

"WHEN BETTER AUTOMOBILES ARE BUILT — McLAUGHLIN WILL BUILD THEM"

THIS appropriate phrase is more than a working motto, more than a stirring slogan—it is a promise backed by performance.

McLaughlin builders have won today's undisputed leadership on a Big Idea—a right principle, rightly applied, the famous McLaughlin Valve-in-Head Motor.

But McLaughlin science, skill and building honesty, is ever ready to make that "better" automobile whenever it can be built.

The constant aim toward the greater service is the way McLaughlin builders prove their appreciation of Canada's endorsement.

BUTTER PARCHMENT--Printed or Plain--at Maritime Farmer Office.

TO THE PEOPLE OF CANADA

Two years ago in a message to the farmers of Canada, special emphasis was laid on the important part food production and distribution would play in this world war. It was pointed out that the drafting of twenty millions of men into European battlefields and the destructive process of war itself must inevitably be followed by diminished production and enhanced cost of food. Today Roumania, Poland, Belgium are conspicuous and tragic examples of what these things mean. The German food ration is now half the normal requirements and under the steady pressure of British sea power, the Hun is daily tightening his belt. But though the great stress is on the central powers, other nations are feeling the strain. The smaller neutral countries are confronted with food shortage and high prices. Switzerland and Holland, in arms for defence, feed from their own scanty supply thousands of refugees who, homeless and destitute, have fled thither for sanctuary. England, menaced by an ever-increasing sub-marine warfare, is organizing her agriculture on a new basis, enlisting for her farms the services of women and disabled soldiers, and putting her beautiful and historic parks under the plough. France sows her grain and reaps her harvest, even within the sound of the guns, by the heroic and unceasing labour of her old men, women and children.

Such is the picture of Europe at this hour. Facing the fateful days which lie before us in this third and sternest year of the war we realize with increasing clearness how vital a factor in the final decision the food supply must be. The Government of this country fully appreciates what the farmers have done during the past two years. In urging them to maintain their efforts, though confronted with more difficult conditions, I do it, not because of the high prices which will doubtless hold for nearly all food products, but because of the important and special service which Canadian agriculture can render the Empire at this juncture. All who assist in this work render a great service to the State. I do not say the greatest for that is done by those, who facing death, daily serve their country at the battle front. Thousands of us cannot so serve, but we, who are mercifully free from the iron heel of the invader,—we, who know nothing of the terrors by sea and the privations on land which others suffer, may well redouble our efforts to supply what they may sorely need.

I especially appeal in this critical year to those in our cities and towns who hitherto have not felt the necessity for directing their energies to food production. Individual efforts, even though small and unskilled, will in the aggregate mean much. By applying or by assisting farmers, everybody having health can accomplish something. There is need, not only for an increased supply but for a wise economy of food. If all labour is not efficient there can at least be patience and forebearance where partial efficiency is accompanied by willingness. There is no place in the State now for either half-hearted service or ill-founded criticism. In the common task which faces the country Co-operation should be the watchword. The Dominion and Provincial Departments of Agriculture are already giving, and will continue to give, special attention to the many problems involved. The National Service Board and the municipalities are also devoting their energies to these questions, and I am confident that the various organizations both of men and women throughout the country will give whole-hearted and active support to a work which at this special time is a high and necessary national service.

MARTIN BURRELL,
Minister of Agriculture.

Costs No More Than a "Span"—

It seems almost impossible, but it is true that you can get a handsome, comfortable, speedy 5-passenger Ford motor car for no more than it would cost you for a span of good driving horses, a carriage and harness.

The initial cost of a Ford car is so small that every progressive farmer can readily purchase one.

And who wouldn't rather motor to town, to church, to the railway station, to the neighbor's, than drive? — especially when it is three times as fast to motor, more comfortable and less expensive.

The low cost of running the Ford makes motoring possible for the masses, where it was formerly a rich man's luxury. It makes motoring a matter of good business, especially for those whose time is valuable. And with labor so scarce no one needs the time-saving Ford so much as the busy farmer!

MANITOBA SHIPS WINTER BUTTER

A new milepost has just been passed in Manitoba Dairying. Five years ago fifty carloads of butter were imported from the Eastern provinces to supply Winnipeg's butter requirements during a single winter. Since that time the Manitoba creamery industry has so grown that now no butter is being brought in from outside, and even during the winter season Manitoba is for the first time exporting creamery butter. On January 26 a carload of Manitoba creamery winter made butter left for Vancouver at a price somewhere about 40 cents, f. o. b. Winnipeg. This will help to take the place of the shiploads of New Zealand butter that formerly was brought from New Zealand to supply the Canadian winter demand not only in the Coast cities, but also in many of the interior cities as well. The Manitoba dairy authorities state that our butter is giving good satisfaction on the Coast market and that the grade is being steadily improved in most of our creameries.—Geo. Batho.

The time is past when any man can justly claim that he can tell by looking at or even milking a cow, how much milk or fat she will give in a year.

COSSAR STOCK FARM, Lower Gagetown, N. B.

Importers and Breeders, Clydesdales, Dairy Shorthorns and Border Leicester Sheep. A number of choicely bred animals for sale.

G. C. COSSAR, Prop. **J. MEIKLEJOHN, Agent.**

Elmhurst Stock Farm!

Clydesdale Horses, Hereford Cattle, Leicester Sheep.

We are offering 4 Bulls fit for service, 9 to 12 mos. old. They are good thick, straight bulls fit to head a herd in any county. Prices moderate. We have Rams and Ewes for fall delivery. Write your wants, we can suit you in quality and prices.

William O'Brien & Sons, Windsor, N. S.

SHORTHORN CATTLE

Our present offering is a number of of pure bred calves, both sexes. Let us quote you a price on a nice, dark red, young bull calf.

J. E. HETHERINGTON
Codys, N. B.

Guernseys!

For Sale—Registered stock. Male or female.

T. D. BLAIKIE
Great Village, N.S.

Registered Stock for Sale

Guernsey and Ayrshires Bulls, ranging from nine months to eighteen months old.

Guernsey and Ayrshire New Milch Cows. Also Young Calves of both breeds. Last but not least, Registered Shropshire Ram Lambs. The above will be shown at Shubenacadie District Exhibition.

John McDonald & Son
Shubenacadie, N. S. - Bloomfield Farm

LONE PINE AYRSHIRE

Present offering one bull calf dropped Dec. 23, 1916. Dam Milkmaid of Springbrock Farm, record of a two year old 8,864 lbs. of milk, 349 lbs. of fat, now under test for a four year old, giving almost 50 lbs per day. Sire, Springbank Roger, his Dam has a four year old record of 11,385 lbs. of milk and 511 lbs of fat. Also one two year old bull by same sire.

Stewiacke, Col. Co., N. S.
T. J. HAWKINS,

RIVERVIEW STOCK FARM

Holstein Cattle, Yorkshire and White Chester Swine.

Write us for prices, and breeding of bulls ready for service. Have some nice boars for sale, also Sows ready to breed. The right type and prices right.

Eggs for Hatching from Exhibition Matings

Barred Rocks Pullet Mating Strain.
Yard 1—Headed by Hector, imported from Grove Hill, mated to him are 1, 2, 3 pullet, 3rd hen at Amherst Winter Show, 1, 2 pullet, 2, 3 hen at Kentville.

Barred Rock Cockerel Mating Strain.
Yard 2—Headed by Bradley II, 1st cockerel at Amherst, mated to him are three daughters of Bradley I and three pullets in 1st Kentville pen.

White Wyandottes.
Yard 3—Headed by White Bird, 1st Amherst cockerel, mated to 1, 3, 4, 5 hen and 3rd Amherst pen and 1st Kentville pullet.

Blue Orpingtons
Yard 4—Headed by Blue Boy, 2nd Amherst cock, mated to 2, 3 hen and three hens in 2nd Kentville pen.

Single Comb R. I. Reds.
Yard 5—Headed by Kentville Boy, 1st Amherst cockerel and 1st at Halifax, Yarmouth, Kentville, mated to 1st Kentville pen hens, 1st pullet and 1st hen Amherst, 1914.

Our Rocks won Silver Cup for best display in open class, 1916.

Eggs from these pens $2.00 per 13.

KENTVILLE POULTRY YARDS,
KENTVILLE, N. S.

FOR SALE

R. O. P. HOLSTEINS.

Two bulls ready for service, and several bull calves. The right type and prices right.

Lawndale Stock Farm

Jerseys and Shorthorns

Present Offering in Jerseys:

One Grade Jersey Heifer, dropped Feb. 22nd 1915, bred to our herd bull, "Ol Ferns Lad, 3269. She is due to calve next summer and is large and handsome. Sired by double grandson of "Champ. Flying Fox."

In Shorthorns We Offer:

One all red Bull Calf, dropped in Nov. 1916. Sired by first prize winner in his class Halifax Exhibition, 1915.

One all red Bull, dropped May, 1915, very large and handsome of proven worth in service.

One roan Heifer, dropped Dec. 3rd, 1915, out of a grand milking mother and sired by "Stately Monarch." Grand champion Halifax and Charlottetown, 1916.

One all red Heifer Calf, dropped Aug. 27th, 1916, out of a splendid prize winning mother and also sired by "Stately Monarch," as above.

Write for information.

Potato Selection and Disease Control

An Address Given Before the Farmers' and Dairymen's Convention by Prof. G. C. Cunningham

Last year I had the privilege of addressing the members of the Farmers' and Dairymen's Association on the subject of Potato Diseases. Before discussing the present subject, it would seem advisable to review briefly the statements which were made at that meeting. You were informed that the farmers in the Province of New Brunswick planted approximately 40,000 acres of the best agricultural land in the Province, to potatoes, which is possibly 7,000 acres less than during the season of 1914. If you had received a yield commensurate with the land planted. the labour applied, the fertilizer and seed used, you should have harvested at least 300 or 350 bushels per acre, or a total of 12,000,000 bushels, but instead of producing this amount, you produced about 150 bushels per acre, or a total of 6,000,000 bushels. This possible yield of 12,000,000 bushels is not extravagant and figures are available to show that 300 bushels per acre is a comparatively small yield in proportion to what could be produced under conditions which the farmers of this Province have at their disposal.

The following figures, taken from the reports of the Provincial Department of Agriculture, give the acreage planted, and the total yield for the Province during the years from 1910 to 1914.

Year	Av. planted	Av. yield per acre—Bus.	Total Bus.
1910	47,744	127	6,067,276
1911	47,304	180	8,493,212
1912	43,977	183	8,034,604
1913	47,702	190	9,092,393
1914	47,196	209	9,875,570

These figures show that you have been greatly increasing your yields per acre. In 1910 the average yield was 127 bushels per acre, while five years later, in 1914, the average yield was 209 bushels, or an increase of 82 bushels per acre, or a total increase of 3,808,294 bushels.

New Brunswick leads the other Provinces of the Dominion of Canada in yield per acre. This is not because our potato growers are paying particular attention to the subject, but rather because our soil and climatic conditions are such as to permit us to raise very large yields per acre. In order to raise the largest and best possible yield of potatoes, it is necessary to have a cool, moist climate, a sandy loam soil, rich in organic matter and well supplied with the necessary plant foods. The soil must be thoroughly cultivated both before and after planting the crop. I feel that the farmers in New Brunswick are fairly well acquainted with the importance of thorough cultivation and the use of commercial fertilizers, but many of them fail to realize the importance that should be attached to the use of the very best seed obtainable, both from the standpoint of yield and freedom from disease.

A survey of potato fields which has been conducted during the past two years, shows that almost one-half of the total possible crop has been destroyed by various diseases. In 1915, and the same is practically true for 1916, 47% of the total possible crop, or 5,640,000 bushels were destroyed by four diseases. These diseases, and the ensuing loss were:—

Black-Leg, 7¼ or 840,000 bushels.
Rhizoctonia (Little Potato Disease), 5%, or 600,000 bushels.
Mosaic, 10%, or 1,200,000 boshels.
Late Blight, 25%, or 3,000,000 bushels.

During the past year, a great loss was sustained through a wilting of the growing plants, encouraged possibly by the hot, dry conditions and an unsuitable food supply, brought about by the lack of potash. Many of these diseases are carried in the seed from year to year and can be eliminated if the potato growers secure seed stock from high yielding fields and free from the various diseases. I would like to take time to review briefly some of the more important diseases which are met with to a greater or less extent on practically every farm in the Province.

Black-Leg.—A bacterial disease which so far as is known is carried from year to year by the use of infected seed. In typical cases, infected plants die in the early part of the season as the result of a rotting and blackening of the stem which shrivels at the base where the plant comes in contact with the infected tuber. During the early stages of the disease, the leaves roll up and the plant assumes a more or less bushy appearance, the stem turning distinctly black. In other cases, the disease progresses less rapidly so that the plants arrive at full growth without showing distinct evidence of infection. Plants affected by this latter type of the disease, produce tubers which are usually more or less seriously affected and which serve to carry the disease over from year to year and perpetuate it in the crop. All the evidence accumulated to date indicates that the bacteria causing the disease are unable to live in the soil, even during a single winter and therefore it must be carried by the seed. In order to combat this disease, it is necessary for the farmer to rogue out all the diseased plants during the growing season, and at the time of selecting his seed, to pick out carefully, tubers free from cuts, bruises, or discoloration. Before planting, they should be soaked for an hour and a half in a solution of one pint of Formaldehyde in thirty gallons of water. When cutting the seed, the farmer should be careful to discard any tubers showing signs of discoloration. The roguing out of diseased plants during the growing season from stock intended for seed, is one of the most effective means of controlling Black-Leg. This practice, coupled with treatment of the seed, forms an almost complete control of the disease.

Rhizoctonia, or Little Potato Disease.—This disease, as previously pointed out, causes an average loss of 5%, or 600,000 bushels, and in some cases the loss has been known to approximate 50% of the crop. It is caused by a fungus which is very generally distributed in all agricultural soils and has recently been shown to be a normal inhabitant of virgin land. There are three types of this disease. One which is met with in the Western States, where it causes an injury closely resembling Common Scab. The second type is well recognized by most farmers and house-wives who find the fungus growing as a small black aclerotin or black specks like warts, scattered over the surface of the potato tuber. The third type, which is serious in practically all parts of New Brunswick, is that known as the "Little Potato Disease." The fungus attacks the roots and stem of the plant below the surface of the ground, causing brown, sunken, cankerous lesions which more or less girdle the stems so that they are unable to perform their function of taking food from the soil to the growing plant, or of transferring the starch which is produced in the leaves, to the underground stems where it is stored in the form of tubers. A badly attacked plant shows a decided wilting, accompanied by a thickening of the stems, and, in some cases, the formation of aerial tubers in the axils of branches or loaves; in addition to this we almost invariably find the potatoes forming just at the surface of the ground, sometimes as many as 50 or 100 small tubers. none of which are of any value for seed or table purposes. At the present time, no reliable method is known for the control of this serious disease and it is hoped that the farmers who are interested in the potato industry, will endeavour to find for themselves some method whereby the disease may be checked. There is a possibility that the use of vigorous seed may aid to some extent at least, in overoming this trouble.

Mosaic.—The Mosaic disease, so far as is known, is not caused by any fungus or bacteria, but is believed to be an indication of running out or degeneracy brought on by growing potatoes under unfavorable conditions. Such conditions may be brought about by poor cultivation, insufficient food or moisture supply, and by abnormally hot spells during the growing season. It is characterized by yellow mottling of the green of the leaves, and in many cases accompanied by a puckering of the foliage. In mild cases the plants are large, but in other cases the plants are greatly dwarfed. Since it is the green coloring matter in the leaf, which, in conjunction with the sunlight, manufactures the carbon dioxide of the air, and the moisture brought up from the roots into starch, that enables the plant to produce tubers, it will be readily seen that the yield must be greatly reduced by the displacement of the green coloring matter by the yellow coloring matter, which does not manufacture starch. In addition, the small diseased plants naturally cannot produce as many marketable tubers as a large plant.

At the Experimental Station at Fredericton, evidence has been collected to show that this disease causes serious damage, in some cases amounting to over 50% of the crop. Plants which are badly infected, usually fail to produce any marketable tubers. Evidence has also been collected to show that the disease is hereditary. Once a plant has become affected, the tubers produced by that plant will carry the disease and produce similar plants the next season, and in most cases the disease is more pronounced during each succeeding year until the plant fails to produce at all. Therefore, in order to control this disease, the farmers should carefully remove, during the growing season, all plants showing indications of the disease, and in addition, select medium sized, good looking tubers for seed.

SEED SELECTION

From the remarks which have been made concerning diseases, it will be seen that possibly the most efficient way of eliminating disease, improving the quality and increasing the yield of the crop, may be brought about by careful selection and too much emphasis cannot be placed upon this important subject by the farmer who wishes to obtain the best possible yield, or to produce stock which would be suitable for seed purposes. If the potato growers of New Brunswick are to compete successfully with other potato sections and to find a ready market for their crop, it is necessary for them to improve their stock by producing seed selection.

The following is a brief outline of the method which should be followed by the progressive potato grower:—

During the past year we succeeded in having about 150 farmers select

(Continued on page 289)

Alfalfa Outlook in Prince Edward Island

By J. A. Clark, B.S.A., Superintendent Experimental Station.

Alfalfa growing is still in the Experimental Stage in Prince Edward Island. Many have grown it in a small way for a number of years and the demand for information is ever-increasing in regard to the cultivation of this crop. The observation and suggestions offered herein are based on the writer's personal experience on his father's farm, at the Experimental Station at Charlottetown, and upon observations of the methods of others who have been more or less successful in growing alfalfa in various parts of the Province.

Soil and Location

Land for alfalfa should be well drained either naturally or otherwise for the plant will not tolerate wet feet, neither can it live if it is covered with solid ice during the winter, It is naturally a dry country plant and does better on what we call warm open land. A shelter that will hold the snow through the winter is a good protection against spring heaving. An application of lime is beneficial.

Seed

When good seed is obtained and the land worked up into good tilth for clover seed, alfalfa has always caught well. The percentage of failure in getting a good start when alfalfa has been sown at almost any time throughout the Spring or early Summer is very low indeed. This would indicate that the seed sold in this Province has had a good strong vitality.

Varieties

Tests with so-called varieties of alfalfa have been made at this Station from year to year. Efforts have been made to secure the hardiest strains obtainable. The plant in the photograph was from a plot of common alfalfa named Hungarian which in 1912 gave three cuttings as follows: June 25th, 5 tons 639 lbs. per acre, August 3rd, 1 ton 1081 lbs. per acre, and August 24th, 1 ton 86 lbs. per acre, total, 7tons 1806 lbs of cured hay. This was the average yield worked out from small plots sown in duplicate. This was much above the average yield of any years and was a very unusual crop.

The alfalfas of the variegated type have withstood the Spring heaving slightly better than common alfalfa. This is probably due to their more wide spreading root system. A straight tap root is more likely to be broken than the type shown in the illustration.

When we are able to get seed from hardy vigorous plants that have withstood our climatic conditions here, we will have made a long stride forward in the cultivation of this fodder plant in Prince Edward Island. The variegated alfalfa which at present seems to be the hardiest here frequently acts like other cross-breds and is sterile. At Charlottetown during the Summer of 1914 the different strains of two year old variegated alfalfa did not produce seed from either cutting.

Inoculation

Sometimes after securing a good stand the plants seem to stand still showing lack of vigor about midsummer or in the following Spring and assume a light or yellowish green color. This indicates that the plants need nitrogen and that they have already used up the available supply that was in the soil. In poor land this may occur with seedlings only a few months old. Even in such areas dark healthy spots a few feet in circumference may be seen here and there in the field, where the foliage is a dark, rich green. These indicate that these plants are getting an abundance of nitrogen, no doubt from the bacteria which forms nodules on the roots of alfalfa whenever it is present and from which the alfalfa plant in due time receives a sufficient supply of that necessary plant food, nitrogen. The presence of bacteria on the roots of alfalfa is indicated by nodules that often form in clumps that resemble miniature bunches of grapes.

It will pay to inoculate the soil when seed is sown on land for the first time. Many farmers receive each year from the Experimental Station inoculated soil from old alfalfa plots. This is sown on the land at the rate of about 200 lbs. per acre and worked in at once. It is well to prevent the sun shining on these bacteria, because like their destructive relatives they die when exposed to the direct rays of the sun.

Difficulties

The two chief difficulties met with in growing alfalfa here are the spring heaving of the plants and the crowding out of the alfalfa by hardy native plants, the most tenacious being the natural grasses. To overcome the first, land should be chosen that is naturally well drained, or the land should be drained. Types of alfalfa should be chosen that are least liable to be killed when they are lifted by frost. The injury by the second difficulty can be to a large extent overcome by thorough, clean cultivation for a considerable period before seeding and by the use of the disc harrow, run with a very slight angle, on the field after each cutting. The bloom has been found to be a very poor guide to determine the time to make the different cuttings. It is much better to examine the crowns and cut as soon as the crowns begin sending up a number of new shoots.

With untried plants it is always well to begin in a small way. A few rows that can be hoed and kept clean or a quarter acre that can be fenced makes a very good sized plot to begin with. Very much can be learned about this plant by observation. We have found that thorough, clean cultivation is essential so that the plants may get a firm foothold before the natural process of crowding by the many persistent plants begins. A splendid time to seed is just before a warm June shower, the date does not seem to make much difference.

Encouragements.

Under ordinary conditions alfalfa is as valuable and about as sure a crop as red clover. It has lived over winter under the same conditions with red clover and quite as many plants survived. Under many adverse circumstances alfalfa has shown itself to be quite equal to red clover as a biennial crop and there is always not only the possibility but the probability that it will persist and supply the best quality of hay for a number of years. The data gathered up to the present time indicates that under favorable conditions there is a most promising future here for this wonderful forage plant.

SMALL FRUITS--*By R. D. L. Bligh.*

The small fruits, comprising the strawberry, raspberry, blackberry, currant and gooseberry play a very important part in the economy of the household in-as-much as they come at a time when there is a scarcity of other fruit and oftentimes of vegetables as well. No farm is complete without them, yet there are farmers and fruit growers who say that it is cheaper to buy them for the family than to grow them. Doesn't this go to prove that such a farmer and his family would consume far less berries than they would if they grew them in their own garden? Small fruits are too easily grown on our farms to be neglected. The wild berries of the fields and wood lots are fast disappearing, time is better employed elsewhere than in hunting for the few that remain, and such fruit costs too much. Therefore at this time when we must practice economy of all kinds it is important that every fruit grower and farmer should feel it his duty to at least set apart a small piece of ground sufficiently large to be capable of producing all the small fruits that the family can possibly consume during the year.

By way of showing you the urgent need of producing more small fruits than we have been doing heretofore to supply our own domestic needs and the demands of our ever increasing local markets, I will give you the following Statistics taken from the Census of 1911. In that year Nova Scotia had 1,248,719 acres of improved land, of this 711,387 acres were in field crops, 40,512 acres were in orchards, 17,618 were in vegetables and 463 acres were in small fruits, or in other words for every acre of small fruits there were 2697 acres of other crops grown. Of these 463 acres, 263,35 and 5 acres were grown in the counties of King's Annapolis and Hants respectively. Leaving 160 acres of small fruits to the other fifteen counties, 90 acres of which were grown in the county of Yarmouth. The yield from which would go to the nearby American markets and hence not compete with out fruit on our local markets. Furthermore the total number of farms in these three counties at this time were 3578, 3223 and 2949 respectively. Accordingly if each farm produced an equal area of small fruits there was at that time only .07, .01 and .002 acres per farm in these counties of King's Annapolis and Hants.

A Block of Yearling Apple Trees in the Niagara Peninsula.

The yield from these 463 acres of small fruits in 1911 was 767,186 boxes while the population of Nova Scotia at the same time was 492,338, therefore if the berries were evenly distributed each man, woman and child in the province would only receive one and one half boxes of berries during the entire year. How many of you would like to pass one year on 1½ boxes of berries of all kinds? Is it not plain that there is urgent need for the production of small fruits? Is there any need to be pessimistic and dream of our production and small prices with these facts before us demanding an increased production.

We have not been awake to the possibilities that lie before us in small fruit production but have been content in the majority of cases to grow small fruits as a domestic luxury instead of a commercial proposition. When we have been given counties that are naturally adapted to the growing of small fruits it is our duty to grow enough small fruits to supply all the demands that are made by those counties that are not so favourably adapted instead of growing them only for our domestic use. With the exception of a few commercial growers the most of our small fruit producers have only one market Halifax or St. John, with the result that the supply soon grows greater than the demand. Prices fall because these markets cannot consume all the fruit that is being unloaded at their doors. Is it not upon such facts as these that your conclusions are built when you say there is no money in growing small fruits? But are there not other markets besides these, While Halifax and St. John are too well supplied there are the markets of Sydney, Glace Bay, New Glasgow, Amherst, Truro, etc., getting their supply? Are they importing them

from other provinces or are they doing without?

Could not your Co-operative Fruit Companies develop markets throughout the entire province of Nova Scotia and also in other provinces and nearby American cities for small fruits as well as apples and potatoes. Ontario is supplying the western markets with tender fruits which are farther away from them than the markets of Montreal, Boston and New York are from us. Is this because we are content to let someone else grow the berries for these markets? With a little trouble and a greater interest in growing small fruits we could with our present organization put strawberries and other small fruits on those markets in carload lots, equal in quality and as cheaply as any county that can grow them. The opportunity is before you, what will you do?

The average yield from an acre of small fruits at the last census was 1657 boxes, hardly enough berries to pay for half the expense of growing an acre of strawberries. The growing of this class of fruit is just as important and profitable as the growing of our apple crop. The apple grower of today is commencing to realize that it only pays to grow a high class of fruit and he also knows that if he can by better cultural methods grow two barels of apples for the same expense as he grew one barrel before he is decreasing the cost of production by one half. This holds true also with the small fruits but the preceeding figure's have shown us that we heretofore have been satisfied to grow our small fruits with little thought of making them pay. A great many of you have doubtless grown them for your own family use with little regard to the commercial side of the question. But today it is different, conditions have changed, the old methods have given place to the new and it is our duty as intelligent farmers to know what it is costing us to grow our crops, and if they are not paying to know whereas our methods are wrong. Therefore, for the benefit of any who have failed or for those that wish to start commercial small fruit growing, I shall give a few point to consider regarding the cultural methods of the various small fruits, but doing this I wish to give you an idea of the profits that can be made from these crops. These are figures taken from our Experimental Farm at Kentville.

Cost of growing one acre of strawberries,—

Rent of land (2 years)	$ 10.00
Preparation of land	5.00
Fertilizers	40.00
Plants	21.00
Planting	7.00
Cultivation	15.00
Mulching	10.00
Picking	62.22
Boxes	36.00
Crates	38.80
Marketing	15.00
Total	$245.02
6222 qts. @ .08 cents	$497.76
Profit at 08 cents per quart	$252.74
Profit at .06 cents per quart	$128.30

CULTURAL METHODS OF SMALL FRUIT

For the Strawberry.

A warm southern slope is prefered for early fruit although almost any location on the farm will do for the strawberry provided the soil is suitable. The soil is important, although strawberries will do on various kinds of soil still a deep rich well drained, rather light loam that is retentive of moisture is essential for the best results. Such a soil cannot be made too rich if the cultural methods are intensive and strawberries have a place in the rotation. The soil should be free from weeds, avoid soil infested

(Continued on page 307)

The New Deering Spreader

WE now offer to farmers a spreader that makes 20 loads of manure do the work for which 40 used to be required. Besides making this important saving, it is a light-draft machine, low, only 43 inches to the top of the box, yet with ample clearance, and it is sold with the most effective wide spreading device we have ever seen.

The spiral you see just behind the beater does the work. It catches the manure just as it comes from the beater, breaks it up into still finer pieces and spreads so much wider than the machine that the rear wheels always travel on uncovered ground when matching the last strip. The spread is even all across, the same in the center as at the edges.

By the use of the **Deering** spreader, stable manure becomes at once the cheapest and the most effective fertilizer for most soils. The spreader is made in two sizes, No. 5 for small truck farms and No. 6 for large farms.

Send your name and address to the nearest branch house and let us give you the details of this best manure spreader.

The Importance of Planting Vigorous Seed Stock

As pointed out by me at your first annual convention much progress in raising the standard of yield in our potatoes could be made by growers bringing together their seed stock and testing them out under uniform conditions. By this means we would have definite knowledge of how our seed stock compared with others in the community and the inferior stock naturally would be eliminated, as no grower would plant stock of low vitality if he was sure of replacing it by better stock.

This gives an opportunity for farmers to get together and study their crop under uniform conditions, and it also makes possible more effective seed selection work. Seed selection is no doubt of value, but why not start this with the best stock available. The testing should be done under uniform soil conditions and one row approximately 150 feet should serve to obtain reliable comparative yields.

The testing of similar varieties of Garnet Chili potatoes under uniform conditions was started in 1915 at the Experimental Station, Kentville, N. S., and continued in 1916. The yields from the 1915 plots I gave you last season and for comparison these are again given together with the 1916 yield from the seed stock grown on these plots.

We, this year were able, through Mr. Paul A. Murphy of the Division of Botany who has charge of the potato inspection work in Nova Scotia, to secure an additional number of lots of Garnet Chili potatoes from growers in Nova Scotia, yields of which are given in the following table,—

GARNET CHILI

Seed potatoes obtained from different growers in the Spring of 1915.

Through the kindness of your Secretary, Mr. G. C. Cunningham, we were able to secure several lots of Green Mountain and Irish Cobbler potatoes from different growers in New Brunswick. We found it difficult to get pure strains in Nova Scotia and in order to secure reliable comparative data true stock was secured. The yields from this seed stock was as given in the tables below.

Irish Cobbler.

32.—	183.5	16	199.5
33.—	178	11	189

It will be seen that there was a difference in yield in 1915 in the eight lots of Garnet Chili planted of 204 bushels, the highest being 240 bushels per acre and the lowest 36 bushels per acre. The difference in yield in 1916 from seed stock of these plots was 144 bushels, the highest being 212 bushels and the lowest 68 bushels. The lowest and highest yielding plots holding their respective position for both seasons. Fifteen lots of Garnet Chili obtained from growers in the spring of 1916 show a difference of 120 bushels the yield ranging from 278 bushels to 158 bushels per acre. Of the ten lots of Green Mountain tested the difference was 132½ bushels ranging from 313 bushels to 180½ bushels per acre. The seventeen lots of Irish Cobbler show a difference of 142 bushels the range being from 235 bushels down to 93 bushels per acre.

Without a doubt the grower with the very low yielding lot will detect

SHEEP PROTECTION

In the February 20th issue of the Maritime Farmer we dealt at some length with the resolutions introduced and passed by the Nova Scotia and New Brunswick Farmers Associations at their respective annual meetings in Amherst and Fredericton, re the protection of sheep from dogs. If you have not already looked into this matter we trust you will refer to the article in question and write us your views on the matter.

If you are in favor of taxing dogs as a protection to the sheep industry, write us a letter to that effect and we will see that it is placed in the hands of the committee for your province, whose duty it will be to bring the matter to the attention of your Legislaure. You will also help the sheep breeding industry get the desired protection if you will write a personal letter to your representative in your local legislature, asking him to support the purport of the resolution.

It is the duty of every sheep owner and every good thinking dog-owner to support any measure that will give the long suffering sheep breeders redress from the dog nuisance and help foster a languishing, although profitable industry.

We have the following letter anet this subject from Prof. M. Cumming of the N. S. A. C., Truro, which is self explanatory, and we trust interested parties will express their views in accordance with his request:—

"It may not be known to sheep owners that the Nova Scotia law dealing with the killing of dogs is the most drastic in force in Canada. Chapter 61 of the Revised Statutes of 1900, "The Sheep Protection Act" was amended in 1908 so that now any person may kill (a) any dog persuing or wounding, etc., any sheep, (b) any dog being at large and without a collar on which the name of the owner is marked, (c) any dog straying on any farm where any sheep are kept. In the other provinces, clause C is qualified by the words "between sunset and sunrise", but in Nova Scotia there is no limit set. The only exception to the above regulation in Nova Scotia is in the case of a dog belonging to the occupant of the next adjoining premises.

"However, there has developed, especially during the post-war years with their very high prices for mutton and wool, a more insistent demand than usual for a dog tax that will reduce the number of dogs running at large in the Province. At the last meeting of the Nova Scotia Farmers' Association an unanimous resolution was passed favoring legislation for this purpose.

"At present under the provisions of "The Municipal Act," two municipalities in the Province have imposed a tax on dogs and two other municipalities within the past five years attempted to put on a tax but have repealed the tax regulation because of its unpopularity and lack of support.

"In Ontario in 1916, a dog tax was made compulsory over the whole Province, whereas formerly it was left optional with the municipalities.

"At the Nova Scotia Farmers' Association, held in Amherst in January of the present, Mr. O'Brien, of the Live Stock Division, Ottawa, threw out a suggestion that was highly commended by a number of those present, namely, a policy of placing a high tax on female dogs. If such a tax would prove effective in reducing the number of females, it would ultimately reduce the dog population to a minimum and accomplish all that the most drastic law could accomplish. An Act embodying this principle will likely be introduced in the Legislature this winter. This Act will also provide that the taxes collected be set aside in a separate sheep compensation fund to pay losses of sheep either killed or injured by dogs, the owner of which are not known. While this measure will probably be introduced, it is not likely to pass unless it receives general public support. The Secretary for Agriculture for the Provinoe will be glad, therefore, either through the columns of this paper or through private letters, to hear public criticism of this proposed legislation."

FINE FEATHERS DO NOT MAKE FINE BIRDS

Our readers will notice that this issue of the Maritime Farmer goes forth without its characteristic colored cover. Some time ago we sent our order to the mills for cover stock with the expectation that the new supply would reach us before going to press with our March 6th issue. We were informed a few days ago that there was very little chance of doing anything with our order at the present time and that in all probability it might be three or four months before the mills would be in position to execute the order. Our readers will see that this is very indefinite. We have informed the mills that we wish them to put our order through at their very earliest opportunity. Until our new supply arrive, we know our readers will overlook the absence of the colored cover and get as much pleasure and profit out of our columns as they were wont to receive when The Maritime Farmer appeared in its customary dress. The contents of the Farmer will be maintained at its usual high standard. Our farmer friends will therefore receive a fine bird despite the missing fine feathers. The trouble of the Maritime Farmer in regard to securing stock are similar to the troubles encountered by papers and magazines the world over.

FEED OAT GRADES UNFIT FOR SEED

Flour and feed dealers who offer the Feed grades of Western oats should be very careful to warn farmer purchaser against using them for seed. The Feed grades contain oats which are frozen or otherwise unsound and not suitable for milling purposes. They usually give a very low percentage of germination which results in serious crop failure. The sowing of these frozen oats in past years has given the general impression that all Western oats will not do well in Eastern Canada the first year. Home grown seed oats of good quality is so scarce this year that farmers should be especially warned against using the Feed grades for seed.

Eastern Canada farmers are advised to procure local grown oats of the best quality and clean them to thirty pounds per bushel or better if possible. Thus far not more than 100,000 bushels of No. 1 Canada Western seed oats free from wild oats are available in storage. It may be found necessary to make a grade for No. 2 seed oats containing not more than eight wild oats to the pound. This would be very much superior to the Milling or Feed grades which are foul with noxious and other weed seeds.

ADVERTISE SEED GRAIN

We are informed by The Seed Branch, Ottawa, that a large number of inquiries are being received from certain districts asking where farmers can purchase seed oats. Farmers who have seed oats for sale should advertise them in their farm paper. A small advertisement in the columns of the Maritime Farmer will help to dispose of any surplus stock you may chance to have and will also very materially help farmers who are looking for a good supply to locate where they may purchase same. To avoid delays in making sales state the kinds, quantities and prices. If you have a quantity of good oats that you are feeding to your stock, why not separate the best of it and put it on the market for seed, it will help to relieve the scarcity that exists and will bring you remunerative figures. You can easily replenish your feed bins with grain that is not good enough for seed at lower figures than you will get for your good grain. This is one way whereby some of our most careful grain growers may make some extra money in these strenuous times, besides the patriotic aspect of conserving good grain for seed purposes. Farmers are warned against buying frosted oats for seed purposes. There are large quantities of frosted western grain in the bins of some of our grain dealers—beware. A few seasons ago many Maritime Province farmers were badly trapped by unknowingly purchasing frosted grain—do not be among those who will be caught napping this year.

* * *

Every machine and implement which is not in use should be under cover. The winter rains and snows plant the seeds of rust, which are harvested by the manufacturers of farm machinery.

* * *

The roving dog has had his day—a long one. It is now time and high time that he is subjected to reasonable restraint.

POTATO SELECTION AND DISEASE CONTROL

(Continued from page 285)

vigorous potato plants during the growing season and to harvest the crop from them separately, for their seed next year. It is realized however, that many farmers have not performed this initial selection. They should therefore select from their bin, potatoes in shape, from three to eight ounces in weight, free from cuts, bruises and all discoloration. After a suitable selection has been made, the tubers should be soaked in a solution of one pint of Formalin in thirty gallons of water, or in a 1:1000 solution of Bichloride of Mercury. Caution should be taken in using the latter as it is a deadly poison both to men and animals. In selecting potatoes for seed, the general practice of selecting small tubers should be condemned, as diseased or degenerate plants usually produce a high percentage of small tubers, while healthy, vigorous plants are more likely to produce large, uniform tubers.

This constitutes the first stage in potato selection.

When the crop is in bloom, the grower should select the best section of his field which will produce sufficient potatoes for seed for the following year's crop. When the plants are in bloom, he should purify his crop by roguing out and destroying all plants which are not true to the variety which he wishes to raise. He should also pull out and destroy all plants showing symptoms of disease or degeneracy, such as those infected with Black-Leg, Rhizoctonia, Mosaic, Leaf Roll, Curly Dwarf, Spindling Sprout, and any other plants which do not seem to be thrifty or vigorous. He should repeat this process of destroying the rogues, from time to time during the growing season, or at least once more before the plants have matured.

At the time of the last roguing, the farmer should select 100 of the very best hills in his selected plot. These he should mark by means of a stake, and dig separately at the time of harvest. After they are harvested, he will find that many hills which were selected, did not produce as many tubers of the desired shape and size as he expected. Therefore he should cast aside any unpromising hills, keeping only those which gave large yields of ten or twelve merchantable tubers of good quality. The balance of this plot should be dug separately and kept for his next season's planting. The selected promising hills should be planted by themselves in two or three rows, but nevertheless in the same field. These two or three rows would be called his seed plot and to which he would pay particular attention throughout the growing season, as he has planted them to produce seed for the crop of the following year. This we term a seed plot. The successful potato grower does not stop with this one selection, but in order to maintain the quality of his seed he follows the same practice of roguing and selection which was recommended for the first year. Farmers who have continued to follow this system of roguing and selection for a number of years have found it a very successful method of keeping up the quality of their crop.

The question "Should the average farmer get equally good results by selecting from his own stock, or should he change his seed?" The answer to this question should be, "Start with the very best seed obtainable" as the best is none too good and unless he starts from a crop which is not showing a general tendency to running out, he is likely to obtain poor results and get discouraged before he has obtained a class of truly high grade potatoes. Experiments which we have conducted on the Experimental Farms and in fields in different sections of the Province have shown that there is a wide variation in the quality of potatoes being grown by different farmers. In the spring of 1916, Green Mountain potatoes were secured from ten New Brunswick farmers and Irish Cobbler potatoes from seventeen New Brunswick farmers. These were planted on the Experimental Farm at Kentville, N. S., under uniform conditions, each sample receiving exactly the same attention. The results obtained show that the Green Mountain yields ranged from 167 bushels to 295 bushels per acre, a difference of over 108 bushels per acre. The yields obtained from the different Green Mountain strains were as follows:—

RESULTS OF STRAIN TEST PLOT OF POTATOES PLANTED AT KENTVILLE, N. S. GREEN MOUNTAINS.

	Marketable Bus.	Unmarketable Bus.	Total. Bus.
C. F. Fawcett, Upper Sackville, N. B.	295	18	313

T. W. Caldwell, Florenceville, N. B.	77	16	93

Similar tests were conducted by nine agricultural societies in New Brunswick, different sections of the Province being selected for this work, viz., Grand Falls, Andover, Florenceville, Tracy Mills, Hartland, Woodstock, Fredericton Junction, Chatham and Scotch Lake. The arrangement for these tests and the obtaining of the data were made by officers of the Dominion Plant Pathological Laboratory and the work was done by farmers and on farms selected by the respective agricultural societies. These tests included strains of Green Mountain potatoes secured from 114 different farmers and strains of Irish Cobbler potatoes from 34 different farmers. The results from these test plots clearly indicate that many farmers are working with almost unprofitable strains, while their neighbour may have relatively high yielding stock. Time will not permit to give all the data obtained from these experiments, but the figures obtained from the test conducted at Andover on the farm of E. W. and Elijah Sisson, will serve to show the wide variation among the different strains of Green Mountains which are being grown by the farmers in the vicinity of Andover. The highest yield obtained, was with stock received from Sisson Bros., which produced 217 barrels per acre, the lowest yielding strain producing only 135 barrels per acre. The lower table shows the variation in the yields obtained in the test plot at Andover. Equally great variations were obtained from test plots conducted with Irish Cobbler potatoes.

These test plots are valuable in showing each farmer the comparative quality and yielding power of his particular strain of potatoes. If it is poor, then he should change his stock, obtaining it from the farmer whose crop proved to be superior to the other. The farmer who had good stock would be able to obtain a price commensurate with its value.

Owing to the high price which can be obtained for ordinary table potatoes, the average farmer whose stock is poor, should find this an opportune time for disposing of his stock at reasonable prices whereby he will be able to purchase potatoes from some farmer who has exceptionally promising stock. Before he attempts his selection as previously outlined he should determine whether or not his own stock is the best obtainable, and if not, he should immediately take steps to obtain good seed before it is shipped out of the Province. Those wishing to obtain good seed would profit by applying to the Dominion Plant Pathological Laboratory at Fredericton for information on this subject.

An additional point which was clearly demonstrated by these test plots in different sections of the Province was the importance of thorough cultivation. Mr. A. A. H. Margison's Green Mountain potatoes produced on his own farm, 162½ barrels per acre. In the test plot at Tracy Mills they produced 127 barrels per acre, in the test plot at Florenceville, 87 barrels per acre, and in the last test plot they produced 12 barrels per acre more than any other strain. This variation in yield of the same strain of potatoes can only be accounted for by difference in degrees of cultivation and fertilization. On his own farm and at Tracy Mills, they were properly cared for and produced good yields, but at Florenceville the weeds were allowed to smother out the potatoes, and they produced only 87 barrels per acre. This and other observations clearly indicate the importance of thorough cultivation throughout the year. An additional stroke of the cultivator or hoe at a small cost is very likely to result in a profitable crop, whereas the neglect of this last cultivation when the potatoes are producing tubers, is likely to result in an inferior crop.

Before leaving this question of testing the yielding qualities of different strains of potatoes, I should like to point out to the delegates of the different agricultural societies that this is one line of work which they could profitably prosecute, each member of the agricultural societies providing one peck of his potatoes to one of the farmers who will undertake to plant them under uniform conditions, keep a record of the diseases developing, the number of weak plants, and in the fall compute the yields per acre from each strain in the test. This is work which should prove profitable to any agricultural society and stimulate interest in the improvement of the potato crop.

HOW OATS MULTIPLY

During his address at the Ontario corn show last week, Dr. Zavitz of the O.A.C., told how a single grain of oats multiplied in three years. Starting with one seed, in three years a little over 100 bushels had been produced. It was good seed to start with—but it pays to use good seeds. He would prefer, if given the choice, one ounce of good seed of a kind that he could get in no other way, than 100 bushels of ordinary seed.

Study the feeding problem in order to get maximum returns for your outlay. It is important to know what it costs to feed a cow, but it is also worth while knowing how much is left in your pocket after the weed is paid for.

Aroostock potatoes are now bringing $6 per barrel, and the prediction is that the price will go to $10 by planting time. Then the question will arise whether it is not wiser to sell seed stock at that inflated price, and use the land for something else, than to plant $10 seed, pay for fertilizer, labor, etc., and produce a prospective $2 per barrel crop.—Maine Farmer.

HORTICULTURE

SOME INJURIOUS, BITING, INSECTS IN NOVA SCOTIA APPLE ORCHARDS

By Alan G. Dustan, Assistant Field Officer, Dominion Entomological Laboratory, Annapolis Royal, N. S.

In a paper of this type, delivered to Annapolis Valley orchardists, perhaps the first insect that should be mentioned is the browntail moth, for it is undoubtedly our worst and most dangerous pest at the present time. I don't intend to go into its life history and control, for you have heard these many times before, but I would like to give some figures, computed from actual counts, that show clearly how the browntail in Nova Scotia is not only being kept in check, but is diminishing from year to year. In passing, I may say that this decrease is due not only to the good work of the inspectors, but to the ever increasing amount of spray that the fruit growers themselves are annually applying to the trees.

The total nests for the last three years are as follows:

1913-14	1914-15	1915-16
24156	18154	14755

These figures speak for themselves and need no further explanation. To date, the total nests for this year show a continued decrease over the number collected last year up to the same time. It seems only natural to expect that this decrease will continue through the remainder of the season.

One important factor in the control of the browntail moth should here be mentioned in order to shield our inspectors from unfair and undeserved criticism in case of an increase in the number of nests during any year.

Each year, when the flight of moths is at his height in Maine and Mass., a few stragglers are driven by the winds across the Bay of Fundy on to the shores of Yarmouth and Digby Counties. Now, on account of their extra strength and lightness, the moths that reach the shores of Nova Scotia are practically all males, which is most fortunate for us. Under some conditions, however, such as a very large U. S. A. flight, strong advantageous winds and dry weather while the flight is in progress, etc., many of the females, as well as males, may be blown across and when such is the case, as was in 1913, the whole of the French Shore becomes heavily reinfested and the work of the inspector, due to no fault of his, has to be done all over again which is most discouraging to him and misleading to the general public until a satisfactory explanation, such as this, has been given.

The Dock Sawfly.—(Ametastegia glabrata.)

Although not a new pest in Nova Scotia, this insect was first recognized as being serious in the winter of 1915-16, when it was found wintering over in excessive numbers in stored fruit grown in an orchard at Meadowvale, N S.

Life History.—The winter is passed by the insect in the caterpillar or larval stage, hidden either in the fruit of the apple, in soft rotting wood or in the bark of trees. At this time the insect is about ¾ of an inch in length, pale green in color and with a dark brown, shiny head. The caterpillar of the dock sawfly is mistaken by many for the codling moth larva. It is an easy matter to distinguish these two, however, since the dock sawfly larva is distinctly green and is usually found near the surface of the apple while the codling moth is white to pale pink in color and feeds near the centre or core of the apple. In the case of the dock sawfly the entrance hole is usually in the side of the fruit while the codling moth enters normally at the calyx end.

Whether hibernating in the bark or fruit, they lie curled up in small cells which resemble their bodies very closely in shape and size. Here the winter is passed, and in the spring, about the middle of May, they commence pupating, the change taking place right in their winter nests. Towards the end of the month the adults, small, shiny-black, four-winged, flies emerge and lay their eggs on the under surface of the Dock leaves, especially the curled-leaf varieties. In about a week, the tiny egg hatches and the caterpillars feed on the leaf until mature, eating large holes right through it as well as feeding only off the lower surface.

When full grown, the caterpillars bore a hole right through the tough outer covering of the dock stem and hollow out a little cell in the soft soft central pith where they change to pupae. This cell closely resembles the cell formed in the apple by the hibernating insect. Two weeks later the adults for the second brood commence to emerge. In Nova Scotia there are three generations in a season. The caterpillars of the last brood, when mature, ascend the trunk of the nearest tree bore a hole into the flesh of one of the apples and tunnel out a cell in which they pass the winter.

Control.—Although this insect does serious damage when abundant, it is one easily controlled on account of its preference for the dock as a food plant. Tests were made in which the larvae were placed on apple foliage to feed but in every case they refused it. Clean cultivation, resulting in the elimination of both species of dock, not only kills the larvae already feeding on it, but forces the

NEW TOMATO "ALACRITY"

THE EARLIEST OF ALL RED TOMATOES

Developed by experts at the Central Experimental Farm, Ottawa, Canada.

ALACRITY produces a closer, more compact vine, sets quite as freely with fine smooth tomatoes, which are usually ready to market ten days earlier than any other strain. The entire crop can be gathered generally in about three weeks from the time the first fruit ripens. ALACRITY is undoubtedly the very best earliest scarlet-fruited tomato. Gardeners who are seeking to have good smooth tomatoes "first on market" can find nothing to equal them.

egg-laying females of subsequent generations to seek their favorite plant in other orchards and fields when laying their eggs. In uncultivated orchards the destruction of all dock plants, by mowing or some other means, gives just as satisfactory results in sawfly control as clean cultivation.

Banding the trees with tanglefoot, before the last generation have fully matured, prevents the larvae from hibernating in the apples which is the only way they cause the orchardist any loss.

The Leaf Sewer. (Ancylis nubeculana)

This pest at the present time is distributed widely throughout the province but in only one case has it been found in large enough numbers to do any extensive damage. Last season an orchard west of Berwick was discovered where approximately 90 per cent of the leaves were attacked.

The caterpillar is small, dark olive green in color and when disturbed usually hurls itself backwards with a nervous wriggling motion. The adult is a small brown and white moth.

The insects attack the leaves, folding them at the midrib and tying the edges together by means of silken threads in such a way as to form a snug nest, half the size of the leaf, with the upper surface on the inside. Here the caterpillars feed during the late summer and fall, eating away the inner (upper- surface and when the leaves fall they are carried to the ground and pass the winter in these nests.

Up to date no work has been done on this insect in Nova Scotia but next season we plan to work out its life history with a view to getting at the best means of control.

Control.—The third or fourth spray by coating the leaves with poison before the larvae fold the leaf are probably the sprays that control the insect. Once the caterpillars get inside the folded leaves it is impossible to reach them with spray.

Fall plowing is also recommended as it buries the leaves which contain the hibernating larvae.

The Tussock Moth

The Tussock Moth is a periodic insect and severe outbreaks occur only once in every eight or ten years. This is due to the fact that the insect is so heavily parasitised. The tussock moth, according to Dr. Saunders, has no less than nine paraistes attacking it. Now when the pest becomes very numerous the parasites also are plentiful and as a result a very great percentage of the caterpillars are killed off and by the next year are practically extinct. But when the Tussocks die, the parasites lose their host. After two or three years of practical extermination the Tussocks again begin to appear and increasing in numbers for four or five years become very numerous, doing perhaps an immense amount of damage, only to be once more brought almost to the point of extermination by their parasites. Thus we see that the number of Tussock caterpillars is wholly dependent on the number of parasites present.

The last serious outbreak of Tussocks occured in 1906-07, when they were most noticable in the east end of the Valley especially in the Kentville and Canning districts. In 1912 a heavy outbreak occurred in Halifax with an accompanying slight outbreak in the Valley. During the summer of 1915 many larvae were noticed and in a few cases serious damage to the fruit resulted. Last season the pest was even more numerous and from this it would appear that we are at the beginning of another serious outbreak which will probably reach its maximum in 1917 or 1918.

Make Money this year from your "Sugar Bush"

Hundreds of farmers to-day make more profit from their "SUGAR BUSH," with less time and labor, than they do from any other crop on the farm.

The demand for Maple Syrup and Sugar is greater than the supply, therefore, prices are good and there is always a ready market.

If you have Maple Trees on your farm which you are not tapping, you are losing good money. Maple Trees always produce a fair crop. They need no care of any kind, yet, each year produce more, and are tapped at a season when you cannot do other kind of work.

WRITE TO-DAY, and let us tell you how to make the most out of your Maple Trees with the least time and effort.

"It is Such a Saving in Labor I Must Have a Power Outfit"

In his sixth order to us, Mr. J. C. Harris of Ingersoll, Ont., says more for the Spramotor than our most enthusiastic advertisement. A man may buy a thing once and be dissatisfied, but when he comes back for additional purchases, there is only one conclusion that we can come to, and that is that article must be all right. We never claimed more for the Spramotor than that it would do the work required of it effectively and economically and in all things give satisfaction. And letters which we have received and are constantly receiving from farmers all over Canada, signify that our statements have been met with a service that is making staunch friends for the Spramotor wherever it is used. Over 100 Gold Medals and Special Awards to the credit of the Spramotor shows that these expressions of confidence are merited. Suppose you write now while the matter is fresh in your mind for a copy of our booklet on crop diseases.

DAIRYING.

ANNUAL MEETING CANADIAN AYRSHIRE BREEDERS' ASSOCIATION

The 46th Annual Meeting of the Canadian Ayrshire Breeder's Association, which was held in Montreal, Quebec, on February 14th, was the largest in the history of the Association, there being over two hundred members in attendance and from almost every Province.

The President, Mr. M. Ste. Marie of Compton, Que., gave a carefully prepared address, in which he expressed appreciation of the courtesy shown the members of his nationality, (Mr. Ste. Marie being of French descent), by electing him the Chief Officer one year ago. He referred to the progress made in 1916,—to the splendid results of the Advertising Campaign in giving the Ayrshire breed desired publicity; to the Dairy Standards Act of Ontario as progressive legislation, which when brought into effect will do away with "pooling" milk at cheeseries in that Province, and remedy an injustice, under which the patron who has supplied a high testing milk has labored; to the request that Oleomargarine be allowed to be brought in, made and sold in Canada which would be a great injustice to the dairy men and an injury to the dairy industry which was the basic one of the farmers of Canada. He advised breeders to exercise more care in their breeding operations, especially in the selection of good sires, and warned them against selling inferior animals for breeding purposes, better send them to the block.

The report of the Secretary, W. F. Stephen of Huntingdon, Que., showed marked progress in every line of work. He said advancement in 1916 had been made under difficulties such as never before experienced. Shortage of labor anl increased cost of production being the chief obstacles, but these have been met and overcome with a spirit of determination that could only bring success.

This speaks well for the enterprise of our breeders during this most awful war, in which our Country and Empire are so heavily involved. For over thirty months the conflict has raged with all the diabolical forms of modern warfare. Still it rages with intense fury, and the end is not yet in sight.

Our Empire has taken her part well in the titanic struggle for the liberty and freedom of the smaller nations as well as for the individual.

Canada has seconded the efforts of the Motherland in such a manner that it has brought her to the forefront as a nation, and thus she now stands.

Nearly four hundred thousand of our most brilliant and capable young men have left the farm, the shop and the office for our Empire's cause. Many will never return having stained the soil of Flanders and France with their blood and laid down their lives in their Country's cause—a noble sacrifice—that this splendid heritage may be ours, and not the enemy's, to exploit.

The war has effected the dairy industry most peculiarly. So great has been the demand for dairy products, caused by war conditions that the price of butter and cheese has soared beyond the conception of the most optimistic dairyman. The price of milk was never higher, to my knowledge. With all, there is less profit to the dairyman, as labor, cows and feeds have likewise reached the highest level, and in comparison with dairy products have made a greater per cent of a rise.

The Ayrshires have proved to be in the PROFITABLE class as their records testify. The productive proclivities, together with the many other excellent qualities of the Ayrshire is bringing her more into prominence. These other excellent qualities may be termed her GOOD FORM, the uniformly HIGH QUALITY of her milk, her PERSISTANT milk flow, and ECONOMICAL production.

There was marked progress in every line of our Association work during 1916. A feature worth noting was the number of new men who started in the Ayrshire business during the year.

The membership was 1365, an increase of 168, as follows:—Quebec 658, Ontario 394, Alberta 76, Nova Scotia 56, New Brunswick 41, Manitoba 36, Saskatchewan 34, Prince Edward Island 29, British Columbia 26, and the United States 14.

There were 6041 registrations, 4000 pedigrees, and 1976 transfers quite an increase over 1915.

In the Record of Performance test there were 708 entries, an increase of 101 and 197 registrations, making a total of 879 cows and heifers qualified in this test to December 31st, last.

To the same date 46 bulls have qualified with four or more progeny.

The Secretary pointed to the fact that the past eight months had been unfavourable to record work owing to the high price of milk feeds. Also, that record work was doing much to develop the breed, as breeders were paying more attention to systematic breeding and feeding with a view to increase size and production.

He pointed to the successful work of the Clubs and to their possibilities for increasing community interest in the breed.

He also referred to the success of their advertising campaign and stated that Ayrshire men had been remiss in not giving their breed more publicity through the press, by articles, and illustrations.

The financial statement showed cash on hand, January 1st, 1916, to have been $6226.38, receipts $10955.-04. The expenditure was $10797.94, leaving a balance on hand of $6383.40. There was received from registrations $7962.03 and members fees $2324.00. The chief items of expenditure was for printing, $3854.11, salaries, Secretary and office help $1700. Salaries, Record Office $1001.56. Advertising, 1069.81, and grants to Exhibitions and Dairy Tests $1540.

The report of the Silver Cup Competition showed the following to be the winners:—In the Mature Class "Lady Jane"—30886—owned by A. S. Turner & Son of Ryckman's Corners, Ont., came first with 18,405 lbs. milk and 786 lbs. fat, and scored 23,535 points. "Lady Jane" breaks all Canadian Records in the Ayrshire world for milk and fat production. She is also a Winter Fair Dairy Test winner.

In the Four Year Old Class "Milkmaid of Orkney"—39834—owned by Harmon MacPherson, Copetown, Ont., won with 14,883 lbs. milk, 596 lbs. fat and scored 14,121 points. This heifer makes a new butter fat record by an increase of six pounds.

In the Three Year Old Class "Scotch Thistle"—41685—owned by A. S. Turner & Son, secures the cup. She gave 14,905 lbs. milk and 631 lbs. fat, and scored 16,779 points. This heifer breaks all previous records in her class by 847 lbs. milk and 97 lbs. fat.

In the Two Year Old Class, "Lenore 2nd"—38514—owned by Harmon MacPherson, made 12,052 lbs. milk and 524 lbs. fat, and scored 13,646 points. This heifer breaks the record of fat in

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

Minard's Liniment Co., Limited.

Gentlemen,—My daughter, 13 yrs. old, was thrown from a sleigh and injured her elbow so badly it remained stiff and very painful for three years. Four bottles of MINARD'S LINIMENT completely cured her and she has not been troubled for two years.

Yours truly,
J. B. LIVESQUE.

St. Joseph, P. O., 18th Aug., 1900.

her class by nearly four pounds.

More interest than usual has centered in this competition and some large records were made.

While the meeting was in Session a statement was received from the Chief Officer of the R. O. P. that Grandview Rose—37030—owned by Shannon Bros., Cloverdale, B. C. completed her years test on January 31st last with 21423 lbs. milk and 890 lbs. fat, equal to 1036 lbs. butter. This cow is due to freshen in April.

The Secretary referred to the possibilities of the Ayrshire breed in Western Canada, stating that the Western Provinces were developing the dairy industry with rapidity and that in 1916 two carloads of choice butter was shipped to Montreal and Great Britain. Also that Alberta made butter was displacing in British Columbia, that from New Zealand. To bring the Ayrshire into more prominence in the Western Provinces it was decided to do some advertising in Western papers particularly, and a Committee was appointed for the purpose of dealing with this question.

The following resolutions were passed:—

Resolution re Dairy Standards Act

Whereas, at the Session of the Ontario Legislation, held in 1916, an act was unanimously passed called the "Dairy Standards Act", which requires, that on and after April 1st, 1917, all milk delivered to factories be paid for on the basis of its butter fat content.

That, whereas, the Canadian Ayrshire Breeders' Association, with its 400 or more members in Ontaria, heartily approves of such progressive legislation, believing it to be in the best interests of the great dairy industry of that Province, and without doubt, if carried into effect would raise the standard of the dairy products of that Province in the markets of the world.

That, whereas, we have learned that there is a possibility that the coming into effect of this act may be deferred from the primary date fixed.

Therefore, we the Canadian Ayrshire Breeders' Association in Annual Session assembled, respectfully urge the Ontario Government to delay not the putting into effect of this act and thus discontinue the injustice of the present pooling system, and that copies of this resolution be forwarded to Premier Hearst and Commission Creelman.

A resolution was also passed asking that the governments of the various Provinces, where similar legislation does not exist that they pass a law requiring that all milk delivered to factories or delivered to cities be paid for on the basis of its butter fat content.

Resolution re "Oleomargarine".

That, whereas, we have learned with regret, that pressure is being brought to bear on the Federal Government to pass legislation, so as to allow the manufacture and sale of oleomargarine in Canada.

That, whereas, were such legislation passed and its manufacture and sale allowed, that it would be a gross injustice to our dairy farmers, and a serious injury to the dairy industry.

That, whereas, there has been little or no call for oleomargarine, by the consumers, but that the request comes largely from vested interests for the purpose of making larger profits.

That, whereas, the enforcing of the oleomargarine law in the United States is a continual source of trouble and expense. That whereas if such legislation were enacted in Canada the same difficulties would be introduced, and the door would be opened to fraud, and oleomargarine would be palmed off on the innocent as butter and at butter prices.

Therefore, we the Canadian Ayrshire Breeders' Association in Annual Session assembled respectfully urge the Federal Government not to introduce legislation that will allow the manufacture or sale of oleomargarine or any fake products in Canada, and that a copy of this resolution be forwarded to Hon. Martin Burrell, Minister of Agriculture, and to the leading papers in Canada.

Resolution re Diplomas

That, whereas we find that the res-

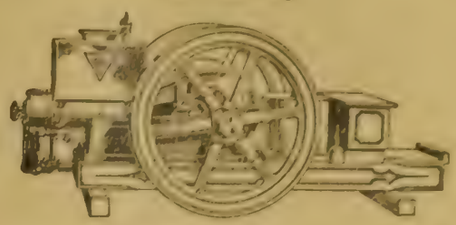
ALPHA

The Best Gas Engine to Buy



WHEN selecting a gas engine, the most important thing is to get a good engine. There is no economy in buying an engine that is going to require frequent repairs and that is likely to balk just at the time you need most to use it.

The wise man considers service, reliability and durability first, and price second. Selected on this basis, the ALPHA is the logical engine to choose, because it is the simplest and most durable in construction and the most reliable in operation. It runs smoothly and powerfully on a minimum consumption of either gasoline or kerosene, and operates on a simple magneto without the use of any batteries.

It is so simple that a woman or a boy can start and operate it, and the sensitive governor, which acts the instant there is the slightest variation in the load, insures steady running without any waste of fuel.

Before you put any money into a gas engine, investigate the ALPHA—and remember that the man who buys the best is never sorry.

Ask for catalogue, prices and complete information. Made in seven sizes, 2 to 28 H. P. Each furnished in stationary, semi-portable or portable style, and with hopper or tank-cooled cylinder.

Supplying the Demand for Royal Purple Calf Meal

This baby food for young animals is partially pre-digested, and can be fed to the youngest animals with perfect safety. It WILL NOT cause stomach or bowel trouble, which are serious ailments in young animals. Royal Purple is a sure preventive for scouring.

Calves Gain Rapidly Without Milk

When the calves are 3 or 4 days old they can be fed Royal Purple Calf Meal and raised just as well without one drop of milk. What prominent breeders remark:

Mr. Geo. W Collins, Plainfield Ont., writes

"Gentlemen.—In regard to your Calf Meal, I think you have the best on the market, as people who have bought it give it great praise. Some have taken their calves off sweet milk, and feed them nothing but your Calf Meal and water, and say they are doing as well on it as they did on the whole milk."

To Whom It May Concern: Uxbridge, Aug. 5th

This is to certify that I have secured your "Royal Purple" Calf Meal from our druggist, Mr. T. C. Nicholls, of Uxbridge and can speak of this meal in the highest terms. I have used other calf meals, but this one is the best I ever tried. I never saw a calf gain more rapidly and thrive better than mine did while using your "Royal Purple" Calf Meal. I can cheerfully recommend it to all our stockmen who wish to raise large, healthy calves."—Stanley W. Croxall.

Note—The above Mr. Croxall keeps a large herd of pure-bred Holstein cattle, and is an excellent authority on Calf Foods.

Royal Purple Calf Meal is equally good for young colts, lambs and young pigs. Put up in 25-lb., 50-lb. and 100-lb. bags. Secure it from our dealer in your town.

PROPER CARE OF PREGNANT ANIMALS ON THE STOCK FARM AT PERIOD OF PARTURITION

During certain seasons of the year the veterinary surgeon in districts where large herds prevail are very busy answering calls for help from farmers whose stock go wrong at the period of parturition. That this is a very critical time with most breeders, and that the wise farmer should give increased attention to the flocks and herds at this time will be readily conceded, but, at the same time, that much of the difficulty met with can be avoided is proven from the fact that some of the largest and most successful breeders seldom find it necessary to call in the aid of a professional practitioner.

The only way to overcome the difficulty successfully or to reduce the loss to a minimum is to be prepared to act promptly in the case of an emergency, and adopt well known preventive measures.

With this end in view the stockman should provide himself with a good reference book or two on common diseases of farm animals and study the symptoms, causes and treatment of them. Next, he should obtain such surgical instruments as are needed in the treatment of these diseases. He should have, for instance, a trochar and canula to use in case of a serious attack of bloating; he should have a good metal or hard rubber syringe for cleaning out wounds or sores of any kind with antiseptics; a piece of rubber hose six feet long is useful sometimes in case of choking or to relieve stomach gas; an injector for flushing out the womb, which may either be a pump for that purpose, or a piece of half inch rubber hose four feet long with a funnel at one end, into which to pour the germicide. This should always be used where the afterbirth has been retained or there is any abnormal discharge from the vulva. Rubber hose should be kept in the dark and straight. If coiled up, when not in use it will be useless for the purpose mentioned. A piece of gas-pipe is a good thing to keep it in. Cork both ends to keep out the light, and lay it flat on the floor. Ten or twelve feet of quarter inch rope and the same of three-eighth inch should be kept in the medicine cupboard ready for cases of emergency in case of difficult parturition. There should always be a good strong bottle or two on hand for the administering of medicine; a humbug for holding the cow's head in position, a nose ring for hogs and a good halter for horses. There should also be a few medicines kept on hand. There is not always time to go to town for a supply in an urgent case and anyway there will be much time saved by having a supply right at hand when needed. The following is a useful list, which may be added to or diminished according to the receipts used for various purposes. Sweet spirits of nitre, tincture of laudanum, Fleming's tincture of aconite, raw linseed oil, Epsom salts, bitter aloes, common soda and ginger, and carbolic acid, zenoleum or creoline for disinfecting and to use as a germicide in cleaning sores, etc.

However desirable it may be however to prepare for cases of emergency, it is very much better in every way, as far as possible to avoid sickness and accidents in the herds and flocks, which is usually the result of four or more causes:

First, indiscretion in the use of food stuffs or feeding. Too great emphasis cannot be laid on the subject of proper feeding or domestic animals. If one goes wrong in this department of farm economics, no matter how well other departments are managed, very indifferent success must attend all his activities, for constitutional weakness and disease are sure to follow any carelessness in balancing and proportioning the food supply of the farm. In order to bring the pregnant animal up to the period of parturition in a good healthy condition, so as to withstand the trying experiences of reproduction, the individual physiological needs of the case, for that particular time must be studied be it mare, cow, ewe or sow. To this end nourishing food should be given, food that will not only build up the strength of the dam, but that will also develop the foetus to a normal size and condition. Furthermore, such food should be of a somewhat succulent character as contrasted with dry food that is likely to produce constipation and result in a feverish and unhealthy condition of the digestive tract and general debility of the whole system. Abundance of pure water should be supplied, without which the best available food supply cannot perform its natural function and produce the desired results.

In the second place, the lack of suitable housing is a frequent cause of disaster. In nature the young arrive at the most opportune time of the year; when the weather is warm, the food supply abundant and of the best possible quality; but under domestic treatment all these favorable conditions are usually absent, therefore the need of great care and the exercise of good judgment in this important matter.

The maternal instinct of the female at this critical time is to seek solitude, where she may be away from all animals and other disturbing influences. The fact should be noted in making provision for them in the stable or other place of confinement. A roomy box stall, in a quiet part of the building is usually best, where the attendant can occasionally, unnoticed, observe that no abnormal conditions are present and where any trouble presenting itself may be best overcome. In addition to this proper conditions of temperature, ventilation and other features making for the comfort and contentment of the patient should be observed. One of these irritating and exciting means is frequently found in the farm dog, which should not be allowed near at this critical time.

The next and third source of danger is shiftlessness or lack of care and sanitation. All animals, and particularly those of a highly developed organism, should receive a good deal of extra attention at this time, and indifference on the part of the attendant may easily mean the loss of the animal, her young, or both. This is more noticeable with the mare than other farm stock. When the act of foaling begins, under normal conditions, delivery of the foetus is speedily accomplished, hence the need of prompt measures where any trouble is manifest, and any carelessness or indifference is frequently atoned for in the loss of foal if not the dam also. With the cow speed is less important in the beginning, but subsequently quite as dangerous if attention is not given when needed. The care of the female at this time should include such matters as proper cleaning of pens, stalls, etc., the use of disinfectants and germicides and all matters of sanitation that are in any way liable to affect the health of the individual.

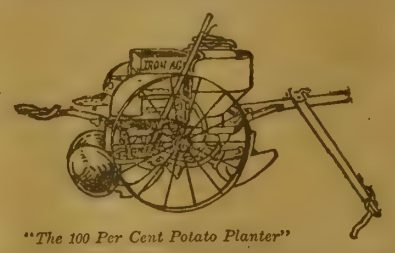
The fourth source of danger referred to is careless or vicious handling of animals when in a pregnant condition. This sort of thing is never excusable at any time; but at this

Don't Waste the "Golden Nuggets"!

Make every seed-piece count, yet make sure of a full stand. This boy will help you do 100% potato planting, with no doubles and no misses. He will save you 1 to 2 bushels per acre—some say a barrel. He earns his way many times over. You can't afford to do without him. Use the seed-saving

IRON AGE Potato Planter

It plants as fast as the team can walk, spaces the seed evenly and at uniform depth. Has no pickers—nothing to cut or bruise the seed. Spreads the fertilizer and thoroughly mixes it with the soil so that it can not injure the seed. Can be had in two styles with or without fertilizer attachments and with choice of furrow openers.



"The 100 Per Cent Potato Planter"

Write today for booklet fully describing this 100% Potato Planter. We also make a full line of potato spraying, cultivating and garden tools.

particular time is senseless in the extreme. One of these foolish practices is frequently seen in allowing dogs to run such stocks; another, driving them rapidly over slippery surfaces, such as ice or slippery cement floors, causing them to fall or in other ways to result in the misplacement of the foetus; and still another striking them with a heavy stick or club which has been known to kill the young before born. Crowding into doorways, although not intentionally vicious, is nevertheless careless and results in loss. In fact, there is scarcely any end to the many ways that females may be injured and serious loss entailed by neglect to observe common sense treatment and rules of conduct in the care and management of the farm stock.

Still another matter of great importance is that of exercise. It is a well known fact by breeders that animals kept in too close confinement do not bring forth their offspring in a strong state of constitution and that both themselves and their young are more liable to accident or disease than where reasonable exercise has been taken. There are good physiological reasons for this which it will be well for every stockman or any other man for that matter to look up, if not already advised of the fact.

As already intimated, precaution among these lines will reduce the possibility of loss to a minimum so far as the treatment of the animal is concerned; but still further additional precaution may be taken by the stockman in having someone on hand at frequent intervals to look after the interests of the patient. Of course this is a tedious matter at night, but may often save a valuable animal from destruction; if no better plan is adopted, at least, a visit to the patient late in the evening can be managed by one member of the family and early in the morning by another. In extreme cases, however, surely no one will object to a visit once or twice, at least, during the night.

In the stock-raising business precautionary measures are always to be greatly preferred to subsequent treatment and if this principle be carried out before, at the time, and after the parturition of domestic animals on the farm, there will be few regrets on account of losses and the increased revenues will immeasurably overbalance any that do occur. PROFITABLE BEEF PRODUCTION
Experimental Farms Note

At the Experimental Farm at Nappan, N. S., a number of tests have been carried on in feeding and finishing steers for the market. During the last three years tests have been carried on in feeding good butchers, heavy fed, versus good butchers, light fed; good stockers, heavy fed, versus good stockers, light fed; good butchers, heavy fed, versus good stockers, heavy fed; good butchers, light fed, versus good stockers, light fed; and good butchers and good stockers, heavy fed, receiving two pounds molasses in addition to their regular meal ration, versus good butchers and good stockers, heavy fed, no molasses; and good butchers and good stockers, light fed, receiving two pounds molasses in addition to their regular meal ration versus good butchers and good stockers, light fed, no malosses.

The results of the first test, that is, good butchers, heavy fed, versus good butchers, light fed, are as follows,—Eight steers were selected in such a condition that they could be classed as good butchers. These were dehorned and fed a preparatory ration to get them accustomed to their feed and surroundings; then divided into two lots of four each. The four heavy fed received 50 per cent more roots and meal than did the light fed. Number of days fed, 93; total live weight at beginning for Lot 1, heavy fed, 4478 pounds; at finish 5355, an increase of 877 pounds. For Lot 2, light fed, 4413 pounds at beginning; at finish 5135, an increase of 717 pounds. The original purchase price was 6¼ cents per pound, live weight. The selling price was 8.1 cents per pound, live weight. The gross profit for Lot 1 was $153.88; for Lot 2, $139.81. The total cost of feed for period was, for Lot 1, $99.16; for Lot 2 $75.29, leaving a net profit in the first instance of $54.72, or a profit per steer of $13.68. In the second $64.62, or a profit per steer of $16.13. The average profit per steer, for three years, over and above the actual cost of feed at market prices was for Lot 1 $18.38, for Lot 2 $22.39. The cost to produce 1 pound gain was 10.33 cents for Lot 1 and 8.64 cents per pound for Lot 2. The ration fed to Lot 1 at the beginning was 60 pounds roots, 6 pounds meal, and 1 pound molasses; at the finish 45 pounds roots, 16.5 pounds meal and 2 pounds molasses. Lot 2 received, at the beginning, 40 pound roots, 4 pounds meal and 1 pound molasses; at the finish 30 pounds foots, 11 pounds meal and 2 pounds molasses.

From the above results it will be noted that a profitable limit can be reached in the amount of feed fed to good butchers and that in all our feeding work we should be guided accordingly. That is to say, feed liberally and well, but not to excess and good profits can be made by producing the right kind of beef.

(The results of other tests will be given in following articles.)

Extremely Severe

Dyspepsia

Halifax (N.S.) Sergeant in the C.E.F. Cured Completely by Dr. Cassell's Tablets.

SERGEANT DUNCAN MacNEIL, of the **CANADIAN EXPEDITIONARY FORCE,** writing from Europe (his home address is **116, PLEASANT STREET, HALIFAX, N.S.**) says:—

"For six years I suffered from frequent attacks of Dyspepsia, each attack being more acute than the last. During one of these attacks life would become almost unbearable, and I would have to regulate my diet to liquid foods only, often being in bed for days at a time. I was under the care of a Physician, and tried all the remedies on the market, spending a small fortune, but obtained little or no relief. I became utterly discouraged, and had almost given up all hope of Cure.

Sgt. MacNeil.

"When the war broke out I joined the Expeditionary Force and came to England. I had not been long here, however, when my old trouble returned, and I had to go to hospital. While in hospital a friend told me of Dr. Cassell's Tablets and I decided to try them. The first box brought such pronounced relief that I continued the treatment. In about four months I was completely cured. I was effected.

"Since taking Dr. Cassell's Tablets I have been through hardships beyond human endurance, but not once has my old trouble returned to bother me."

The above is the frank, clear testimony of a Canadian soldier. He has been cured of extremely severe dyspepsia, which even the healthful life of the training ground could not overcome, and he wishes to tell others that he owes that cure to Dr. Cassell's Tablets.

THE HORSE

HEIGHTS AND WEIGHTS OF DRAFT HORSES

Those who write to breeders who advertise draft horses commonly ask questions about the size of the animals. It is natural for a prospective purchaser to desire information of that sort before expending time and money on a trip to see the horses. He wants to be reasonably sure he will find what he seeks. And yet the inquiries frequently reveal ignorance as to essential indication of size. The simple request for weights is often made, but it never brings valuable information if answered without qualifications. Those who have ever fattened draft horses know that a very thin horse may actually add 50 percent to his weight while fattening.

Height is the best single standard of size in horses. Mule men have horsemen beaten far in this matter of classing according to size. In some of the old-country shows draft stallions and mares have their classes subdivided according to height. The shape which belongs to draft type is fairly well understood by horsemen. If a horse is described as 16 hands high and of well-proportioned draft build a man knows about what kind of horse is meant. Then a statement as to being fat or thin gives an idea also as to weight, or a statement of weight gives an idea as to the amount of flesh carried.

Horsemen know, for example, that a well-proportioned draft horse 16 hands high and weighing 1,400 pounds is thin, and weighing 1,800 pounds he is fat. If he only weighs 1,200 pounds he is very thin. If he weighs a ton he is either overloaded with fat or else is rather lower-set than the best standards of showrings and markets. The best horses that weigh a ton or more stand 16:2 to 17:2 hands at the withers and some of the largest horses are a full 18 hands high and still are well proportioned. Some of these bear down 2,400 pounds and even more on the scales.

Careful draft horse judges can bt seen making a mental note of the height of showring candidates, as they are deciding how they will place them. The measurement of height prevents any confusion as to size that might arise because of variation in light or level of ground on which the animal is standing, or contract with horses of different size in the same class. It provides an absolute and unvarying standard. A good horseman standing a few feet from a horse can tell almost to an inch what the height is. The handiest men at this trick are the ones whose own heights are 5'8", 5'10" and 6'. Their eyes are usually at 16 hands, 16:2 and 17 hands, respectively, and so they can readily note the distance of the withers above or below the level of their eyes. A measuring stick is clumsy to carry and manipulate and it is seldom at hand when wanted, but a horseman always has his eyes with him—and he needs to have them wide open.—Breeder's Gazette.

PUREBRED HORSES EXCLUSIVELY

Some draft horse breeders make it the invariable rule to keep nothing but pedigree horses on their farms. They are the exception, it is true, but they set a commendable example. If some purebreds are desirable to have, all purebreds should be still better. The purebred horse that cannot work is not fit to keep. There hangs the argument at the start. Most of the grade draft brood mares in this country are regular farm workers. The purebred mares are usually even better individuals in appearance, so they ought to be superior in harness. If they are not of more than average utility we do not want them.

Most of the shielding and pampering of pedigree mares arises from the owner's desire to protect his rather large investment from the risk of injury, overwork or interference with breeding. But idleness is bad for the mare. She is more liable to be injured running in the pasture than quietly working in the field; she can do just as much work as a grade mare of the same size and quality, and there is abundant evidence that work mares breed as regularly as any others. The general experience is that they produce stronger foals than idle mares. In winter the mare has considerably better conditions when she works regularly than when she runs along slippery paths in the pasture or fights with others for a share of whatever shelter is provided.

Usually not all the mares will be pregnant and so any extra heavy work can be done by those which have skipped breeding. When all the horses on a farm are registered mares the visitor is always favorably impressed. There is then no intimation that the pedigree animals are expensive "white elephants." They prove that they pay their way. They show that they are the right sort to produce other horses that can work as well as breed. With all the horses registered there is no suggestion that careless pedigree record work on the farm might result in a grade being sold as a purebred. It looks better, at least. Just for appearance alone it is worth while to emphasize registered horses to the limit.

ITCH IN HORSE MAY BE ERYSIPELAS

I have a mare eight years of age that has very itchy spots around her head, neck and belly. The hair falls off in patches, and when she scratches there is small red spots. It appeared about two years ago and went off, and now it has broke out worse and I cannot find anything to stop it. What do you think this disease it, and what will cure it? C. K.

It is very difficult to diagnose a case like this from a written description. It seems to me to be a form of erysipelas. It may be superficial and only involve the upper layers of the skin, or it may be deeper seated and involve the under layers. It is contagious to a small degree, and this is the reason it is spreading to other horses. It is common to some districts and usually follows wounds, injuries and sores, but comes on apparently healthy skin. Zero weather and filthy stables is bad for giving rise to this trouble in horses, and damp, hot weather in summer without the necessary cleaning and grooming.

Make up an alterative compound of Epsom salts 4 ozs., nitrate of potash 2 ozs., and linseed meal 4 ozs.; mix. Give a tablespoonful twice a day in a soft feed. Mix 1 ounce of sugar of lead in 1 pint of water and keep the parts wet with this solution. If the irritation spreads in spite of this treatment, paint the healthy skin for two inches all around the diseased part with tincture of iodine and change the lotion to 1 ounce tincture muriate of iron in 8 ounces of water. You should persist to get rid of this disease.

SHOE BOILS OR CAPPED ELBOWS ON HORSES

Shoe boil is the general name given to a bunch or swelling on the elbow, caused by the shoe pressing against it while the horse is lying down At first shoe boils are bruises, hot and sore, sometimes developing

pus and breaking or have to be opened, occasionally laming the horse and making trouble generally. If neglected they usually develop into a hard, gristly bunch of varying size, and at this stage are a permanent blemish unless completely cut out with the knife. Occasionally the hard lump is the result of only a slight but continued irritation without apparent soreness or pain, but finally growing into a shoe boil just the same.

Horses with roomy stalls and plenty of bedding do not often have shoe boils. The horse in the narrow stall where there is no chance to lie on his side comfortably is the one that of necessity tucks his feet under him while down to rest, and thus makes shoe boils. Many visits to city stables show that horses in cramped quarters with scarce bedding are the ones that present the most capped elbows.

Preventives—where liberal stall room and bedding are out of the question—are limited to shortening the inside of the shoe and buckling around the hoof some sort of a pad or shield to keep off the pressure.

Horses do not lie on their feet and make shoe boils from choice. Give them room and bedding and shoe boils will be the least of their troubles.

THE SIZES OF DRAFT FILLIES

Accurate weights and measurements of Percheron fillies at different ages are given by Prof. J. L. Edmonds in Bulletin 192 of the Illinois experiment station, Urbana. These fillies are of the Percheron pattern and of the most commonly accepted draft proportions for youngsters of their ages, so the figures are instructive.

The fillies whose firstrecorded measurements were made at 5 to 6½ months old were then 13:1¼ to 13:1¾ hands high and weighed 685 to 775 pounds. The fillies that were 7 to 8 months old at the outset of the test were 13:0¾ to 14:0½ hands high and weighed 810 to 970 pounds. Most of the fillies were then in moderate flesh.

At one year old the heights varied from 14:0¼ to 15:0¼ hands and the weights ranged from 1,035 to 1,260 pounds. The smallest in height was the lightest in weight and the tallest was the heaviest. At 2 years old the heights varied from 15:1 to 16:0½ hands and the weights from 1,425 to 1,775 pounds. At that age one of the lighter fillies had stretched up to a trifle more height than the heaviest filly, showing an individual difference in the manner of maturing. The amount of growth in height between 12 and 24 months old varied from 3½ to 5¾ inches, and the average for the 10 head was 4½ inches.

At one year old the average height was 14:2¼ hands and the average weight 1,112 pounds. At 2 years the average height was 15:2¾ hands and the average weight 1,548 pounds. These standards may fairly be considered reliable for well-fed and well-bred Percheron fillies. If a breeder's youngsters fall behind these figures they are not doing as well as they should.—Breeder's Gazette.

A THREE-HOUR DAY FOR THE HORSES

The horse has a three-hour day, according to a Minnesota investigation carried on under the direction of Thomas Cooper, now the director of the North Dakota Experiment Station. It was found that a farm horse averaged about 100 hours labor per year or about three hours per day. It was also found that the cost of maintenance for the horse was $85.00 per year. This emphasizes the need of keeping brood mares and raising colts, so as to get more returns from the work horses than the three hours of labor per day.

RENNIE'S FARM GARDEN
Pure--New Seeds

Improved Beefsteak Tomato (enormous size). Pkg. 10c, ½ oz. 35c, oz. 60c.

HORSE STAGGERS AND IMPURE BLOOD

I have a four-year-old colt that staggers when he is let out of the stable; his hind part seems to swing round when walking. He seems to be lively enough and eats well. B. M.

From the description given it would appear that your animal is suffering from stomach staggers and that his blood is in bad order. Give him a dose of medicine as follows: Six drachms barbadoes aloes and one pint raw linseed oil mixed. Take his grain feed away for a few days and feed sparingly. Very likely you can note that his urine is dark and coffee colored, and for this three ounces of spirits of nitre in a little water should be given him. Also give him flaxseed tea, lots of it, to drink; if he will not drink it, drench him with it liberally. Always avoid gorging horses with too much food when not working as this is the chief cause for the symptoms you describe in your horse. O. V. T.

Why do some farmers make three times as much profit as others on the same amount of capital and the same acreage? It is simply due to good farm management.

THREE VITAL QUESTIONS

Are you full of energy, vital force, and general good health? Do you know that good digestion is the foundation of good health; Pains and oppression in stomach and chest after eating, with constipation, headache dizziness, are sure signs of Indigestion. Mother Seigel's Syrup, the great herbal remedy and tonic, will cure you.

AFTER MEALS TAKE

MOTHER SEIGEL'S SYRUP.

AND BANISH STOMACH TROUBLES

At all Druggists, or direct on receipt of price, 50c. and $1.00. The large bottle contains three times as much as the smaller. A. J. WHITE & Co. LIMITED, Craig Street West, Montreal.

Had Severe Cold
ON HER LUNGS.

RAISED PHLEGM AND BLOOD.

Never neglect what at first seems to be but a slight cold. You think perhaps you are strong enough to fight it off, but colds are not so easily fought off in this northern climate, and if they are not attended to at once will sooner or later develop into some serious lung trouble such as bronchitis, pneumonia, and perhaps that dreadful disease, consumption.

Miss Kasye McDonald, Sydney Mines, N.S., writes: "Last winter I contracted a severe cold, and it settled on my lungs. I would cough and raise phlegm and blood. I had the cough for a month, and had medicine from the doctor, but it did not seem to do me any good. I really thought I had consumption.

My friends advised me to use Dr. Wood's Norway Pine Syrup, which I did, and it gave me great relief. I am very glad I used 'Dr. Wood's,' and would recommend it to every one."

You can procure Dr. Wood's Norway Pine Syrup from any druggist or dealer, but be sure and get "Dr. Wood's," when you ask for it as there are a number of imitations on the market, which some dealers may try to palm off on you as the genuine.

See that it is put up in a yellow wrapper; three pine trees is the trade mark; price 25c. and 50c.

Manufactured only by THE T. MILBURN CO., LIMITED, Toronto, Ont.

POULTRY.

THE EGG SITUATION

The year 1916 was one of unusual activity with respect to the Canadian egg trade, unprecedented high prices prevailing during the late spring, summer, and fall months. The direct cause of this was the unusual demand on the part of the British market for the Canadian product, in preference to supplies obtainable elsewhere.

General Review of 1916.

Owing to the relatively large shipments of Canadian eggs during the fall of 1915, Canadian storage holdings were not of sufficient quantity to supply the local demand, and the result was a considerable movement of United States eggs into Canada for a consumption during January, February and March. At first these imports consisted wholly of storage eggs, but even before the end of January considerable quantities of fresh-gathered United States eggs were being offered on the larger Eastern markets. These came, for the most part, from the Southern States of Oklahoma and Tennessee, and were offered as early as the 15th of January on the Toronto Produce Exchange at 36c, freight and duty paid. The market generally held firm throughout January, but, owing to the increasing receipts of fresh-gathered stock, declined rapidly throughout February and early March. Occasionally at times the lowering price had the effect of stimulating consumption, and this would be apparent in a slightly firmer tone, although the general tendency was downward from a price of about 30c the first week in February to 25 and 27c the latter part of the month, until the lowest price of the year was reached about the third week in March. The market took a very radically downward turn about the 9th of March. This was a direct reflection of the sharp reaction occurring on the Chicago market about that time.

During the two weeks following, a very uncertain market prevailed. The tendency of the trade is to buy at the lowest price possible, and sell at the highest. Generally, early in March, with the opening up of the storage season, the probable future storage sales price is the basis which regulates the price of eggs. The tendency in the States last spring, following the heavy production of the previous year, was to keep the price down to below 20c. The visit to Canada and the Eastern United States markets along this time, of representatives of the largest British importing houses, however, and the general feeling of confidence created by their presence, and prospective buying, gave the market a very buoyant feeling, and the result was that, while some endeavoured to keep the price down to its usual level, the general prospects for lucrative sale were so favourable that there caused the wildest scramble for eggs on the part of the trade generally that this country has ever seen.

The lateness of Easter week in 1916 also gave the market a firm tone at a time when it is generally weak. From a price of 20 to 21c in the last of March and the first of April, a steady advance took place throughout April and May, the price to producers advancing from 21 to 22c early in April to 25c the end of May throughout the Eastern markets generally. With the advent of hot weather, it was confidently expected that some reaction would take place, but the persistent export enquiry, and the generally favourable weather through June offset this, and prices continued steadily upward, and June eggs, and even early July eggs, were picked up quickly and placed in storage.

While the export movement of fresh-gathered eggs early in the spring was not large, several shipments aggregating from thirteen and fifteen hundred cases each went forward. and the price received was such as to further stiffen the market. In fact, during the latter part of June Canadian prices reached such a point that at least one car of fresh-gathered United States eggs were brought to Toronto for local consumption, and sold at a profit.

Despite the hot weather of July, prices continued to advance, 26 to 27½c being the prevailing quotation. Receipts of eggs continued large, many local points, in fact, reporting an increase over the previous year, but, on the other hand, however, local consumption was higher than ever before. In fact, one is safe in stating that the per capita consumption of eggs in Canada during 1916 was very much increased over previous years. This was due, without doubt, to the high price of meats and other animal food products, and the fact that, in many of the smaller villages and rural districts, it was practically impossible to get good fresh meat at any price during the hot weather. Another instance of this was evident in the Western Provinces this fall, when the meat ration of the majority of the threshing gangs consisted largely of eggs.

Fortunately for Canada, no attempt was made to move many Canadian eggs to the Old Country during the hot weather. Some went forward as late as the second week in July, but those that were shipped between that time and the first of September were largely United States eggs repacked in Canada. For the most these arrived in bad shape and the direct result has been that Canadian eggs have, for the last four or five months, been quoted on the British market at from five to ten cents a dozen above the United States product.

The heavy movement of Canadian eggs for export commenced about the last week in August, and gradually increased from a few thousand dozen per week until the maximum was reached during the last two weeks of October and the nomth of November. The exports for that time ran from eight hundred thousand to a million and a half dozen per week from the Port of Montreal alone.

Accurate information is not yet available as to the exact proportion of Canadian and United States eggs that went forward. It is common knowledge, however, that hundreds of cars of United States eggs were shipped which would undoubtedly have been Canadian product had the eggs been available in this country.

The export prices received were very high, ranging from a contract price of 33 or 34c for early fall shipments to as high as 42c, and even higher, for later shipments, and the general verdict with respect to the quality of the Canadian product has been very favourable indeed.

The large percentage of the Canadian holdings exported, and the

WARNING! NEPONSET Paroid ROOFING

ITS popularity all over Canada has made "Paroid" a household word. Do not accept inferior grades of roofing as "the same thing as Paroid"—

There is only ONE PAROID —this is the Roll

The Genuine Bears This Label

The surface is GREY. We also make it with an extra wearing surface of crushed slate, RED and GREEN—all permanent colors.

When you use the genuine Paroid, you can forget about your roof for many, many years. Paroid roofs in service now for over 19 years are still giving excellent satisfaction.

Look for "Paroid" on every roll you buy

Hardware and lumber dealers who sell Neponset products will give you good satisfaction.

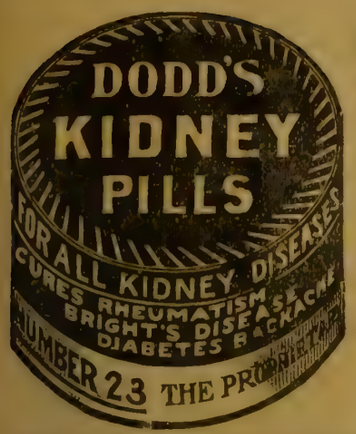
LARVAECIDE MANUFACTURING COMPANY

Head Office 102 Prince William St., St. John, N. B.



phenomenal home demand for eggs had the effect of reducing the stocks in Canadian storage houses to a point far below the minimum usually held toward the latter part of the year. This condition, combined with the slackness of current receipts, owing to the lateness of the pullets of 1916, has had the result of giving Canada unprecedented winter prices this year, as high as a dollar a dozen being asked and paid for guaranteed new-laid eggs on some of the larger Eastern markets.

Conditions with respect to production improved a little during Christmas week and the first week in January of this year, but the continued cold weather since has given production somewhat of a setback. Although mild conditions have prevailed generally throughout the Southern States, their production this year is not nearly as large as last, and the result is that the market generally in Canada continues firm, with the possible exception of British Columbia, where receipts of California eggs have brought the price down to about 45c.

Outlook for 1917.

Naturally, following such a season and the fact that the export demand still continues, the outlook for 1917 is particularly favourable. Of course, the continuation of high prices is more or less contingent upon the conclusion of the war but, even so, it is not expected that in the matter of live stock and live stock products any serious reaction will occur and that any falling off occuring in prices will be gradual.

Canada has the market but is short on the supply. The subsequent development of the poultry industry in this country largely depends upon the reputation established now on the export market. While there is no doubt need for improvement in the quality and in the uniformity of the product going forward, the great need is for the production of such a quantity of the quality desired, that Canada's place on the British market will be assured. To have every reason to believe that the necessary safeguards with regard to the quality of the product going forward will be perfected this year. Our future market is assured, therefore, if we will but increase our production to the extent necessary to hold that market. Canada's liabilities are not going to be met by the production of a minimum amount sold at a maximum price, but rather by the production of the mixamum amount sold at a renumerative price; in other words, the development of a volume of business. The great need, therefore, is for increased production during 1917.

The present prospects with respect to the accomplishment of this end are not the best, however. While undoubtedly the unloading of large quantities of poultry on the market last year owing to the scarcity of feed and other causes has resulted in a cleaning out and cleaning up of poultry flocks generally throughout the country that will ultimately be a blessing in disguise, yet the fact remains that there is not in the country today the number of laying stock that there was one year ago. It is out of the question, of course, to attempt to increase the poultry population of this country very materially between now and the season of high production. However, if every farmer and poultry producer will but exert himself or herself to get the highest possible production from what poultry they have, the shortage in the actual number of birds kept may be overcome to some extent and the Canadian trade may therefore indicate to the British importers that Canada will this year be able to supply as much at least to the Motherland as she did during 1916. Further, if those who have charge of the poultry use the same acumen, judgment and good management in the slection of their breeding stock this spring, the keeping of their poultry houses free of lice and mites and the providing of clean and sanitary quarters for their stock as they did in the culling from their flocks, the mongrel, nondescript and aged stock last fall, production throughout the spring and summer season may even be increased over that of last year.

Now is the time, therefore, to lay the foundation for greater and bigger developments for 1918 and 1919. Generally speaking, throughout the country there is a better sentiment prevailing on the part of farmers generally with respect to the poultry business than ever before, and, with the high prices prevailing for both eggs and poultry, there is reason to believe that there will be this year a much larger distribution of purebred, day-old chicks and eggs for hatching than ever before.

Canada has all the requisites for the production of a quantity far in excess of her own requirements, and with her favourable climatic conditions can, with proper care and attention, produce quality equal to the best in the world. Only the fringe of production possibilities has been touched up to the present. The Western Provinces, with their volumes of cheap feed, are the natural home for the Canadian hen. The bulk of the surplus at the present time comes from the provinces of Ontario and Prince Edward Island. Nova Scotia, New Brunswick, and Quebec do not produce sufficient for their own requirement. They must do more; and will. It remains principally for Ontario, Prince Edward Island and the Western Provinces of Manitoba, Saskatchewan and Alberta to demonstrate to Canada and the Empire as a whole what they can do in this connection in this great hour of trade expansion.

According to the last ceusus, Canada had some 29,000,000 hens; a few more, in fact, than the single state of Iowa. There may be possibly forty or fifty million hens in Canada at the present time. In order to meet our obligations and live up to our opportunities in the matter, the slogan of every poultryman should be,—"150,000,000 hens for Canada in two years." How can it be done? It is not possible in this country to create in the minds of producers generally the steadfast impression and belief that this development is going to be brought about, and to enlist the active services of every breeder and distributor of purebred poultry in a great big national production campaign?

Clearly, the opportunity lies before us. The task which Canada has set before her and which must be met, if from no other than economic reasons alone, demands the steadfast attention of statesmen and laymen alike. We must keep the home fires burning

On the Job Laying
Though Snowed In

Under the most severe weather conditions, you will get plenty of eggs if your hens are properly housed and fed Royal Purple Poultry Specific as directed.

Jno. Cutting, Orpringe, Ont., writes as follows:

"Dear Sirs,—Kindly send me your free booklet on Stock and Poultry. I have used your Poultry Specific all winter, and I would not want to be without it. For fattening chickens, and making hens lay it can't be beaten. I have also used the Stock Specific, and find it as represented."

Royal Purple Poultry Specific

In summer, fowl get grain, herbs, grass and insects, which are Nature's assistants for producing eggs. In the winter and spring, fowl get practically the same grain, but must have a substitute for the herbs, insects. Royal Purple Poultry Specific, manufactured from Roots, Herbs, Minerals, etc., is a most perfect substitute, increases the egg production at once, and makes the hens lay as well in winter as summer—keeps the fowl active, vigorous and healthy—prevents chicken cholera and kindred diseases.

Sold in 25 and 50c. packages, also $1.50 and $5.00 air-tight tins. We also manufacture Lice Killer, 25 and 50c. packages; Roupe Cure, 25c.; Disinfectant, 25c., 50c., $1 sizes.

Secure these products from our dealer in your town.

FREE BOOK

Write for FREE 80-page booklet describing all common diseases of stock and poultry. It tells how to build henhouses and how to raise calves without milk

Secure More Pails of Milk From Your Herd

Royal Purple will increase the flow of milk from 3 to 5 lbs. a day if used according to directions. Mr. Norman C. Charlton, Scott, Sask., states:

"I am from Ontario and fed your Royal Purple Stock Specific when in Brownsville. My cows made the largest average and tested 5 pounds over average at C. M. P., Brownsville. I believe you make the best conditioner on the market."

Royal Purple Stock Specific

The great farm animal conditioner and fattener is used in almost every progressive stock-raiser's stable in Canada. Good for all stock in a run-down condition. Can be used occasionally or continually without showing bad after-effects. Royal Purple Stock Specific is purely a digester and blood purifier. It aids digestion to such an extent as to produce the very best results, and obtain the maximum amount of good from the food eaten. It will enable you to fatten your steers and hogs a month earlier, thereby saving a month's feed and labor.

Mr. Malcolm Gray, of Komoka, states:

"In regard to the feeding of Royal Purple Stock Specific, I had two lots of hogs. To the first lot I fed Royal Purple Stock Specific, and when I sold them they averaged 196 lbs. each. On the second lot I did not use Royal Purple Stock Specific, and at the same age they averaged only 150 lbs. each. They were both the same breed and one lot had as good a chance as the other. We have also fed Royal Purple Poultry Specific with excellent results."

Royal Purple Stock Specific is put up in 50c. packages and large $1.50 and $5.00 tins. Secure our products from our dealer in your town. Write for free booklet on how to treat all common diseases of stock and poultry. Tells how to build hen houses and how to raise calves without milk.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

SHE JUST KEEPS HOUSE FOR ME.

Jean Blewett.

She is so winsome and so wise
She sways us at her will,
And oft the question will arise,
What mission does she fill?
And so I say with pride untold,
And love beyond degree,
This woman with the heart of gold,
She just keeps house for me—
For me,—
She just keeps house for me.

A full content dwells in her face,
She's quite in love with life,
And for a title, wears with grace
The sweet, old-fashioned 'Wife';
And so I say with pride untold,
And love beyond degree,
This woman with the heart of gold,
She just keeps house for me—
For me,—
She just keeps house for me.

What though I toil from morn till night,
What though I weary grow,
A spring of love and dear delight
Doth ever softly flow;
And so I say with pride untold,
And love beyond degree,
This woman with the heart of gold,
She just keeps house for me.

Our children climb upon her knee
And lie upon her breast,
And ah! her mission seems to me
The highest and the best;
And so I say with pride untold,
And love beyond degree,
This woman with the heart of gold,
She just keeps house for me.

THRIFT.

By permission of the writer, Miss M. V. Powell, Whitby, Ontario.

Thrift to-day means preparedness. The women of Canada have responded beyond all expectation to the emergency call made to them since the declaration of war. To-day, another call echoes through our fair Canada—a call that can only be responded to by the co-operation of every woman in our country, under the capable management of the women of Canada, the natural home-makers and educators of the youth of to-day as mothers, can the save and serve policy of Thrift be successful.

The great war is depleting our land of many of the strongest, most vigorous of our citizens, and the development, physical and mental, depends very largely upon the work of the women in the home, involving as it does, the importance of food in relation to human welfare which is great.

Miss Watson expresses her clear vision of the situation as follows:—"The daughters of Canada should not be sent to homes of their own without the training necessary for intelligent buying, and satisfactory preparation. They should either receive it at home or be sent to school and given opportunity to learn it before marriage." Thus armed we will avoid waste, husband and conserve our resources, and prove that we are as capable to assist in the building of a greater Canada as in patriotic work for the men at the front.

Economy in the home and the preparation of nutritious food at small cost is women's work, and far more vital to national welfare than the question of a career for women.

There is food enough in flesh and vegetable wasted in Canada every year to feed every hungry mouth if conserved and saved. It has been said that more is wasted in a Canadian home in one week than would keep a French family for two weeks.

Waste nothing, buy nothing from abroad that can be produced at home.

To-day, as we stand face to face with our national duty, and look into the future, we realize that if we are to face the future with any degree of preparedness, our duty is to eliminate waste in human things as well as in food stuffs.

To make every human being capable of discharging his or her responsibility to the fullest capacity, "the wise woman looketh well to the ways of her household—and eateth not the bread of idleness." Our national business is to eliminate waste in human beings and to make each human being capable of making good.

These ends can be reached by the best training of childhood, in the homes and in the school. As homemakers we must make not mar the success of our future men and women—the youth of our land.

We are the builders of their character, their ideals of personal and civic duty, so that our opportunity today invites our best effort for home and Canada by honest thrift of all our talent and power. We are still a young nation and on us depends the ability of the nation to compete successfully with the world as a nation: ours the hands to mould and build for our nation's best welfare.

In the greater Canada towards which we are moving with breathless speed, the womanhood of our land is being driven with unresisting force. With every important and vital interest of the nation, woman's power and influence will be identified. She is not only being forced by national conditions into the national life, but she is being qualified to meet these conditions with intelligence and power. At the present moment of national struggle the great cry is for conservation of our forces in every avenue of life. Especially is there being urged a campaign for thrift and economy. For years past the trend of our country has been towards waste and extravagance. We have been recklessly squandering our means, indulging our desires, gratifying our wishes, in pleasures, luxuries and speculations. Now we are being brought to a realization of our recklessness, and with that knowledge is born the desire to place our nation upon a firmer foundation.

In the great campaign for thrift women are powerful and influential factors. If we are to meet with any degree of efficiency the strain and drain upon our resources, we must eliminate waste from our lives. We can be of invaluable service to our country by eliminating waste in human life. On every hand we see valuable human life and energy wasted.

The proportion of preventable death in childhood is far greater than should be, and is a serious drain upon the national life. Women can render most efficient aid in reducing the death rate of children, by establishing classes for instruction in health and hygiene among the poor, teaching the children the proper care of the body, studying the food values and nutrition of foods, giving practical demonstrations in preparation of simple nourishing dishes for different seasons of the year, and employing preventive means in dealing with disease, thereby preserving a high standard of health in thise who survive, as well as lowering to a noticeable degree the loss of human life.

That the world should have wholesome meals at reasonable cost is of vital importance to the welfare of the nation.

The usefulness, efficiency and happiness of the individual depends largely on health. While Sir Thomas White is calling to the men of Canada to develop natural resources by products, by food stuffs, while he calls to every man in Canada to produce all he can, to work doubly hard while our soldiers are in the trenches. in order that the resources of the country may not only be conserved but increased for the great struggle that lies before us; that the people of Canada preserve their credit and keep the nation strong by increasing production and exercising reasonable care we call to the women of Canada to help by thrift; we who are so capable to "save and serve."

We would pay tribute to our late Dr. C. C. James, whose passing so suddenly from our midst has been so keenly felt; and in so doing, we would place on record the valuable aid he has left to the people of Canada in the practical help given to us along thrift and production lines. Especially helpful has he been to the women of Canada, as in his statement, "I do not know any way whereby an individual can save money and have it for investment except by the old-fashioned mode of living within his income and saving his profits to the extent that he can. I do not think there is any magic method. The way for Canada to become a lending country is for Canada to produce all she can, and to save what she can."

The pioneer mothers of Canada realized this, and to them is due in a large measure the prosperity of our land to-day, and the bravery of our sons at the front; and now that the building of a greater Canada awaits our best effort, the women of Canada must respond in the same way if they would make good, and leave to the coming generations a cultivated, civilized country, governed by honor, justice and liberty. One thing is, of course, needful if the requisite measures are to succeed, that each shall sink his personal interests unreservedly in the common weal to-day. This is indeed a difficult task for women, but we have all got to live. It is not a question of money at all, but of bread, meat and potatoes.

All our standards of life are changing. The nation must go back to the simple life, to the less luxurious method of our ancesters, henceforth the citizens of this country will have to pull together.

There never was a time when the need was greater for economy in domestic expenditure, nor a time when there was a greater need for knowledge regarding food values, and the preparation of nutritious food at small cost.

This is essentially woman's work, thus to women has been given an important work in the affairs of life. The usefulness, happiness and efficiency of the individual depend largely upon health which is so governed to a great extent by the suitability of food

HUSBAND SAVED HIS WIFE

Stopped Most Terrible Suffering by Getting Her Lydia E. Pinkham's Vegetable Compound.

Denison, Texas. — "After my little girl was born two years ago I began suffering with female trouble and could hardly do my work. I was very nervous but just kept dragging on until last summer when I got where I could not do my work. I would have a chill every day and hot flashes and dizzy spells and my head would almost burst. I got where I was almost a walking skeleton and life was a burden to me until one day my husband's stepsister told my husband if he did not do something for me I would not last long and told him to get your medicine. So he got Lydia E. Pinkham's Vegetable Compound for me, and after taking the first three doses I began to improve. I continued its use, and I have never had any female trouble since. I feel that I owe my life to you and your remedies. They did for me what doctors could not do and I will always praise it wherever I go."—Mrs. G. O. LOWERY, 419 W. Monterey Street, Denison, Texas.

If you are suffering from any form of female ills, get a bottle of Lydia E. Pinkham's Vegetable Compound, and commence the treatment without delay.

THIS WASHER MUST PAY FOR ITSELF

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right, but pay me first, and I'll give you back your money if the horse isn't alright."

Well, I didn't like that. I was afraid the horse wasn't "alright" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

Our "Gravity" design gives greatest convenience, as well as ease of operation with quick and thorough work. Do not overlook the detachable tub feature.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see, I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, *before they pay for them*, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six minutes. I know no other machine ever invented can do that without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight, too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that on washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50c a week till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes six minutes.

State whatever you prefer a washer to operate by Hand-Engine Power-Water or Electric Motor. Our "1900" is very complete and cannot be fully described in a single booklet.

Address me personally, S. D., Morris, Mgr., Nineteen Hundred Washer Co., 357 Yonge St., Toronto, Ont. (Factory: 79-81 Portland St., Toronto.)

and its proper preparation.

We hear to-day the statement—"The way to success is to get the women interested." And we say that women can help to build up Canadian industries while the war is still on by remembering CANADA first, the EMPIRE next, let our trade follow the FLAG and purchase goods at home, demand Canadian products, for not only must everyone pull as a nation, we all must pull together.

If our people continue to be economical it is possible that Canada will have a favorable balance after the war is over; but much, very much, depends on how we, the women of our fair Dominion, husband our resources. Let us save and serve during these anxious days when our brave men are at the front. Thus we, too, can do our duty and help on a general "Thrift Campaign" by careful dispensation of supplies, food, clothing and luxuries which seem to have become to us necessities.

Only when we realize that we are the trustees of our own incomes and sink self in the building up of a greater Canada will useless extravagances be abandoned. Let us be so busy that we will have no time to think of inconvenience, and by the simplest, easiest and most comfortable modes of living have time for high thinking and helpfulness to our country, resolved that by a steadfast purpose we will help to secure freedom and justice as the heritage for our children. Thus the women of to-day will leave to coming generations a heritage worthy of the effort and sacrifice. We will not know defeat, for by care and attention to our home-making we will win for ourselves a reputation not surpassed by early settlers for thrift in the hour when our nation requires our best; as one woman let us work. Here is our opportunity to show we are worthy of the confidence placed in us. Therefore do not waste materials; spend your money wisely. Every penny saved will help Canada to finance the war and win, and help us to make good in the greater Canada after the war.

The call for "Thrift" has gone forth everywhere. Let us respond to the call, quickly, quietly.

The children of our country are its greatest asset. They are our future men and women. Morally and physically let us study their needs and with careful economy supply all needs.

Such a call may never come to us again, and so we say respond to the call quickly and quietly.

You who have men at the front should not live in greater luxury than before your husband or son enlisted You should do your part. The country needs your unselfish patriotism nnd help.

The women of France have given us an example of what can be done by thrift and resourcefulness.

b. ?'fs1s etaoin shrdlu cmfwyp eta

The women of Canada scarcely know the rudiments of economy. Let us spend wisely, secure value for our money.

The physical necessities of life we would classify as Shelter, Food, Clothing.

Thrift means a system under which all can thrive.

Be brave! Men must fight, but this is not the time for women to weep. We must be a strong, united force, joining hands to save and serve, while we sympathize, and renew hope of the future of a greater Canada, and while the women are doing their "bit" in the home they are at the same time making their best preparation for other duties that await them; for they must take their places in the life outside the home, and there respond to the call for economy and thrift in matters of interest to all. The School Boards and Municipal Council will demand the careful judgment of the women who make a success of their home. The community call will require to be responded to by preparedness. Thus to the women of Canada will come many problems after the war which thrift alone will aid in solving, whether civic, Provincial or national.

PEERLESS
PERFECTION
No matter how fast it comes, the most unruly animal can't break through a *Peerless Perfection Farm Fence*—it springs back into shape.
Made of heavy Open Hearth steel galvanized wire with all the impurities taken out and all the strength and toughness left in. Every wire is crimped running the fence into one continuous spring. Top and bottom wires are extra heavy. Will not sag. Requires less posts than ordinary fence. Absolutely guaranteed.
Don't buy a rod of fencing until you get our illustrated Catalog. Describes our big line of farm, poultry and ornamental fencing. Also Peerless farm gates.
Agencies almost everywhere. Agents wanted in all unassigned territory.

A KITCHEN IS CONVENIENT

1. When it is small.
2. When there is cross ventilation and not a draft either at the work-table or sink.
3. When there is light over the left shoulder at the work-table to prevent eye strain.
4. When the stove is a few feet from the work-table and allows the right hand to open the oven door easily.
5. When the working surfaces are even with the palm of the hand.
6. When the cold closet is built into the outer wall and the ice chest is within a few steps.
7. When shelves are narrow and open and when corners are rounded.
8. When there are two routes, the route for preparation and the route for cleansing and placing dishes.
9. When all stores are in glass or tin containers and clearly labelled.
10. When a kitchen cabinet and wheel tray are used.
11. When a corner is made in which to consult a cook-book at ease.
12. When harmonious colors and cleanliness create a feeling of rest and comfort.

COUNTRY LIFE MADE PLEASANT AND PROFITABLE

It is my object to show how country life may be made pleasant and profitable at the same time.

The farmer must prepare himself for his vocation in life as any other professional man prepares for his. It is only when we understand our subject in hand and have a knowledge of the best principles of that subject, that we can thoroughly enjoy it. Labor is made more pleasant by a knowledge of the best methods of performing it, and by applying methods much valuable time is saved which may be turned into profit. Education leads to method and system.

The farmer suffering from a lack of agricultural information wastes much time (undeveloped resource) debating "what to do next", and in ignorant experimenting with fertilizers and crop rotations, much expense and loss of time is incurred.

It will be plainly seen then, that one of the first necessities to a profitable and pleasant existence on the farm is an agricultural education, beginning with the earliest years at school, followed by a term at an agricultural college, and furthered by a careful observance of nature throughout life.

One of the pleasures of farm life is the close contact it makes possible with nature; probably no other vocation affords such a good opportunity as does farming to study nature in all her various forms. Here again is education necessary; Education helps to make a man quick and observant,—mindful of little,—without it his power of observance is dulled, and such a person would not be truly appreciative of the wonders of nature.

One of the greatest disadvantages under which many of our farmers labor is the lack of modern machinery and farm "hands." Both of these difficulties may be overcome if the farm is made to produce a surplus sufficient to buy the now necessary machinery. This will show the young man, if the farm is so fortunate as to have produced one, that there is something in farming and that the work does not consist of more drudgery. A new pleasure and pride instilled by the modern machinery will encourage the boys to stay on the farm, and if the boys remain in the country we may naturally suppose that a majority of the girls will be contented their also. This would help the country life socially.

Perhaps there is no other point from which our farm life suffers as in the lack of entertainment proved for its young people. Although there is much dignity and pleasure in work itself, yet no life would be complete and perfect without a certain amount of pleasure derived from other sources sandwiched in with that obtained by the love of labor. Country life would be made much more pleasant yes, and profitable too, if reading clubs and societies were given a higher place in the community life than is generally the case. All that is needed to make these clubs possible, is a few earnest and energetic workers to nurse them along during the first trying years of their existence.

How often do we hear our grandparents exclaim: "Oh! the good times we used to have at the husking and spinning bus", etc. It is deplorable that some such old fashioned entertainments are not still a feature of the country life. And as soon as they are once more given their rightful place, we will find the pleasures and profits of our country life greatly increased.

Many of our farmers do not realize the necessity of pure bred stock on the farms. To make our farms profitable one thing necessary is stock, but we want stock of good quality and suited to the district. Many do not realize that pure bred stock is more profitable than mongrels. Pure bred sheep have more and finer wool; pure bred cattle are marked by producing more milk and beef. It is just as easy to care for pure bred stock as mongrels, and returns from pure bred stock will yield a larger profit. There is a pleasure in the appearance of pure bred stock and poultry on the farms. Some of the farmers are not even familiar with the points of beef and dairy cattle. Upon the good management of the stock of the farm, much of the farmer's success depends; and it is satisfactory to know that that which promotes the comfort of the stock, also increases the profit they produce. Harsh and cruel treatment should be recognized as decreasing the profit which any animal will produce, because it is punishing to the stock. The suffering undergone by the animal involves a corresponding loss to the owner. Kind and careful treatment of stock, is one of the foundation stones of good and profitable management.

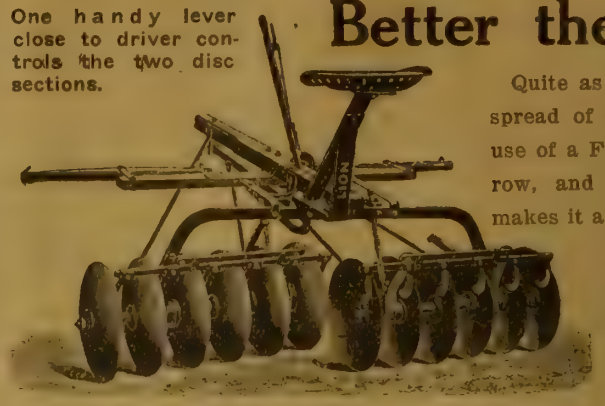
What has been said about stock will apply to seed cultivation. Farmers will plant the same seed year after year, till the kernels become shrunken and vitality lessened. If this grain is used for seed, and has vitality sufficient to germinate, the plant under ordinary conditions will be a weakling, and produce but small return. In this way fertilizer, seed, labor and time are wasted, and good taken from the soil. If these same expenditures were intelligently applied to the seed selection and the breeding, a large yield would be the result.

The practical farmer is a business man in the literal sense of the term. His aim is to live and prosper—to educate his family and to enjoy the blessings which come from being in close touch with nature.

"God made the country and man made the town,
What wonder, then, that health and virtues

The Finer the Mulch---the Better the Crop

One handy lever close to driver controls the two disc sections.



Quite as important as a spread of fertilizer is the use of a F & W Disc Harrow, and its light draft makes it a pleasure to use.

The value of a good seed bed cannot be over-stated. Take no chances THIS year.

Frost & Wood "Lion" Disc Harrow

A staunch in-throw Harrow; the two disc sections, held in place by an immensely strong main frame of steel, are run on highly polished, dust proof ball bearings, and the angle of their "cut" is controlled by one handy lever. The inside discs are kept into the soil by strong springs and driver's seat is well back so as to lessen neckweight on horses, meaning extra light draft. Two sizes, 12 and 14 discs.

SEE YOUR NEAREST FROST & WOOD DEALER

He'll gladly show you these splendid Harrows and other implements in the old reliable "F & W" line.

Work It Hard as You Please

Its light draft and staunch build enable you to tackle the roughest field.

Frost & Wood Champion Disc Harrow

Forecarriage makes work and turning easy

Two easily-operated levers, handy to driver, control the disc sections, so you can vary the "cut" of the discs very quickly to suit the ground. The disc sections run on splendid, ball bearings; and light draft is further helped by the discs being kept always clean and bright by scrapers, thrown in and out of use by convenient levers. Immense strength, and high quality materials, ensure few repairs and year-in-year-out readiness for work.

F & W guarantees and reputation are your ample safeguards.

McLAUGHLIN CARRIAGES

are undoubtedly the highest grade Carriage ever put on the market by any manufacturers in Canada. Their policy—one grade only and that the best—is as firmly adhered to now as in the past.

We want Agents in all localities where the goods are not now sold. Perhaps you would like to act as our Agent.

If you would like to purchase one of our Carriages this season and there is no McLaughlin Agent near you, write to

H. A. AMOS, - - - Oxford, N. S.

General Agent for New Brunswick and Nova Scotia

Needed on every farm — Renfrew Standard — Thousands of users

A woman, signing herself "Farmer's Wife," and writing to the "Ohio Farmer" magazine, said:

"It is the cream check that pays the grocer and dressmaker, builds houses and barns, buys the piano, sends the children to college."

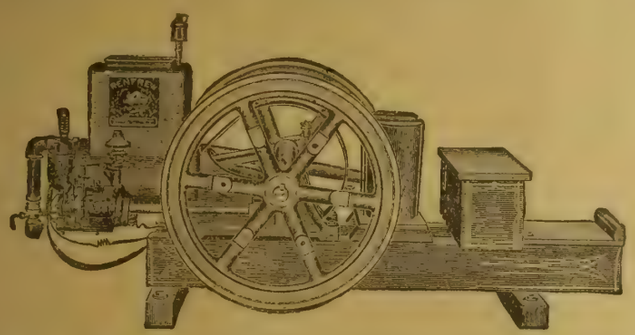
Verily, the cow and the cream separator seem to be given the place of honor on Ohio farms. And well they should, for what else returns so much profit per dollar invested?

An investment in more cows and better cows will pay almost every farmer—especially if he has a Standard Cream Separator to get the utmost possible cream profits for him.

Canadian Government Dairy School Reports show that the Standard Cream Seperator skims down to .01 per cent. In other words, the Standard loses but one-tenth of a pound of butter-fat in every one thousand pounds of milk skimmed. Do you know of any other cream separator that can furnish unbiased proofs of equally close skimming? Remember, it is one thing to claim close skimming and another thing to prove it to the hilt.

The Standard is not only a wonderful skimmer, it is also a sanitary skimmer. It is easy to keep its smooth, wide-open bowl and polished steel discs sweet and clean. There are no hard-to-get-at places where dirt and impurities can collect and taint the milk. Cream skimmed by the Standard taste sweet and delicious. It brings the highest price.

There are other features, such as automatic oiling, interchangeable capacity, patented guide pin, curved wing centre, helical tooth main gear, which we haven't the space to describe here in detail. But we will send our Separator Catalogue containing complete information. Write for a copy.



You Need One Greatly To-day

With farm labor so scarce and so high, every farmer needs a gasoline engine—in some cases two of them. And a Renfrew Standard will soon pay for itself. Just make a note on a piece of paper of all the ways it can save work for you. The length of the list will surprise you. Then send the list to us, and we will check it up and tell you other ways it can lift your burden. We will also send you our Engine Catalogue, which tells about the dual ignition, steam engine governor, starts without cranking, and other features of this famous engine.

Don't Guess. Weigh Everything

The only way to make sure you are getting paid for every pound you sell is to weigh everything—and this applies to what you buy, too. Scales are a necessity on every farm—and the Renfrew Truck Scale is the handiest for the purpose. Wheels around like a truck.

Weighs anything, small or large, from a pound to a ton. Government inspected and fully guaranteed. You cannot make any mistake buying one. Thousands in use weighing cream, produce, cattle, etc. Write for Scale Booklet.

THE RENFREW MACHINERY COMPANY, LIMITED,

AGENCIES ALMOST EVERYWHERE IN CANADA.

Gifts that can alone make sweet the bitter drought
That life holds out to all, should most abound,
And least be threatened in the field and groves."

Stella Blacklock.

A CLEAN MOUTH PROTECTS HEALTH

Do you wake with a bad taste in your mouth? Don't blame your liver. It is much more likely that your teeth are at fault—thirty-two to one, says Chas. H. Lerriga, D.D. Instead of taking liver pills, let the dentist see if there are any pockets of pus round your gums or decaying cavities in your molars. When he has done his best for you supplement his work with a toothbrush in the hands of your own most humble servant, being especially careful to practice a thorough sluicing of the ivories just at bedtime. Bad taste is divorced as long as you pay the nightly alimony.

Constantly we are discovering some new yet perfectly obvious thing about the human economy that it seems absurd ever to have overlooked. Discoveries about teeth are among the latest. An aching molar has always been an object of suspicion; but one that does not ache, performs its service of mastification in reasonable fashion, and looks respectably clean has always been reckoned a friends and defender.

Now we learn that a grinder of quite innocent appearance may yet be harboring enemies to our internal peace and quietness; that it may be giving shelter to organisms ready to corrupt the blood, disorganize digestion, and, penetrating the defences of far distant joints, give rise to the excruciating pains of rheumatism.

The great protection of the tooth from decay is its enamel. This is the hardest substance found in the human body, but if abused by such usage as biting hard candy or cracking nuts with the teeth it cracks and opens avenues for decay. While children should be warned against such abuse of their teeth this does not mean that they should eat only soft food. We believe that the mastication of food that requires vigorous chewing is very helpful to a child. It aids in the development of the dental arches, and the fact that prehistoric man excelled in the quality of his teeth may be ascribed to his coarse bill of fare.

There is no question whatever that every child past two years of age should be examined by a competent dentist at least once a year—better every six months. Given an opportunity at the very first sign of decay, the dentist can make his repair with so little pain that the child will be spared all nervous shock, and the expense of such treatment will be trifling.

It is especially important that a child's teeth be examined at the time that the first permanent tooth arrive, at five or six years of age. These are the keystones to the dental arch and it is quite important that they erupt properly and are not infected by decayed temporary teeth which may make contact with them. They develop in the lengthening jaw back of the temporary twenty, so they do not have any milk teeth to push out of the way. By the time the full permanent set is establish you should have twirty-two teeth; but since the third molars, commonly known as "wisdom teeth," do not come through the gum earlier than eighteen to twenty-five years of age, it very commonly happens that possession of the perfect number is prevented by early extraction.

(Continued on page 306)

Had Weak and Dizzy Spells.

WAS CURED BY

MILBURN'S

HEART AND NERVE PILLS.

Mrs. J. S. Nicholls, Listowel, Ont., writes: "I was weak and run down, my heart would palpitate, and I would take weak and dizzy spells. A friend advised me to take your Heart and Nerve Pills, so I started at once, and found that I felt much stronger, and my heart was ever so much better in a short time. I cannot praise your medicine too highly for it has done me a world of good. My husband has also been bothered with heart trouble ever since childhood, and finds quick relief by using your valuable pills."

Milburn's Heart and Nerve Pills have been on the market for the past twenty-five years, and are universally known as the very best remedy for all troubles arising from the heart or nerves.

Milburn's Heart and Nerve Pills are 50c. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

TESTED RECIPES

Fudge Cake.

2 cups brown sugar, 2 eggs beaten separately, ½ cup melted butter, ½ cup milk, ½ teaspoon soda in the milk, ½ teaspoon cream of tartar, 2 cups flour, 2 tablespoons cocoa, 1 teaspoon soda in ½ cup boiling water.—Mrs. H. W. Estabrooks, Fredericton.

Hot Milk Cake

2 eggs beaten very light, 1 cup sugar, ½cup hot milk, 1 generous cup flour, 1 teaspoon baking powder, flavor with almond.—Mrs. H. W. Estabrooks, Fredericton.

Walnut Cake

1 cup sugar, ½ cup butter, 2 eggs, ¾ cup milk, 2 cup flour (pastry), 2 teaspoons baking powder.

VENO'S

THE WORLD'S BEST

For COUGHS and COLDS.

Veno's Lightning Cough Cure is the most popular remedy in the world for coughs and colds. People who once try it use it again; they tell their friends about Veno's and these friends tell other friends. Why? Because there is real curative power in Veno's Lightning Cough Cure; because it is quick and sure in action; because it contains no dope and is suitable for young or old, from infancy to extreme age; because it cures as nothing ever cured before. Prices 30 cents and 60 cents, from druggists and stores throughout aCnada.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

The Seed-Producing Capabilities of the Province of New Brunswick---An Unexploited Field

A more general and complete appreciation of the opportunities open for development in the agricultural industry of the province of New Brunswick could not but be cognizant of the suitability of her climate to the production of high-class tubers and seeds of cereals, to such an extent that a specific seed trade in these might be established, while seeds of Timothy, Red Clover and Turnips could be profitably produced in such quantities as would meet the home demand.

It is an authentic fact that northern-grown seed possesses a high degree of vitality, high absolute weight and is specially vigorous. These facts taken together with the varied possibilities of production from the numerous types of soil within our province should commend to the agricultural community a recognization as an agricultural asset the suitability of our climate to a development of this as yet unexploited field in seed production.

Home-grown or regionally produced seed of almost any variety of farm seeds acquire a vigorousness, whether due to natural selection aided through the grower by which only the vigorous are perpetuated, or to an acclimitization, by which plants become better adapted, which conduces to hardiness and increased yielding power greater than that possessed by imported seed. There are other phases also worthy of consideration when home-production of seeds is being discussed; namely, there can be no introduction of foreign weed seeds, dependence upon foreign seed supplies and markets is removed and a home industry fostered which may become of such proportions as to favorably affect the commercial trade-balance in seeds.

The office of the seed commissioner has done a great deal to stimulate the home-production of root and vegetable seeds in Canada, by offering a subvention to growers to encourage their production. Last year, subvention exceeding $1300 was paid on 36,300 lbs. of such seeds. The portion of this bonus requested by New Brunswick growers was negligible however. Subvention to ten provincial seed exhibitions in the winter of 1914-15 amounted to $4,251.

A very small proportion of the seed supply of field-roots, vegetables, clover and timothy used in this province is home-grown and, except to this small extent, we are dependent upon outside markets. During the past year however the production of home-grown Red Clover used has assumed considerable proportions, over three hundred bushels having been threshed up to the end of December by the Clover Huller, operated by the Provincial Department of Agriculture. It is estimated that the total production for the province will be about 1000 bushels. There is some difficulty in properly preparing this seed for market, as few of the fanning-mills owned by farmers are equipped with proper screens.

As an approximation, the quantities of seeds used in the production of the following crops in this province each year are about as follows:—

Wheat,	20,000 bushels.
Buckwheat,	50,000 bushels
Oats,	650,000 bushels
Potatoes,	480,000 bushels
Red Clover,	6,400 bushels
Timothy,	20,000 bushels
Turnip-seed,	145 bushels

The average acre yield of field crops for the past eighteen years is as follows:—

Wheat,	18.7 bushels
Buckwheat,	22.5 bushels
Oats,	29.6 bushels
Potatoes,	152.4 bushels
Turnips	452.4 bushels

Any of these crop-yields can be greatly increased by the more general use of better-grade seed, seed which has been home-grown, subjected to some form of selective breeding or grading and over which care has been exercised to guard against inroads of disease.

The propensity of men to try out anything "new" leads many farmers to order a sample of any new variety of oats, wheat, potatoes or even fruits, without knowing its suitability to their district, while their desire to excel prompts many a farmer who may attend stock and seed exhibitions to bring home some specially good stock which has appealed to him in order that he may produce an equally good or better product. The spirit is commendable but the judgment displayed is not always sound, for by such means many varieties are introduced to new conditions which are not suitable or profitable, and the multiplicity of varieties makes it difficult for a dealer to secure any one variety in large quantities, and hence the grower loses the advantage of catering to the wholesale trade.

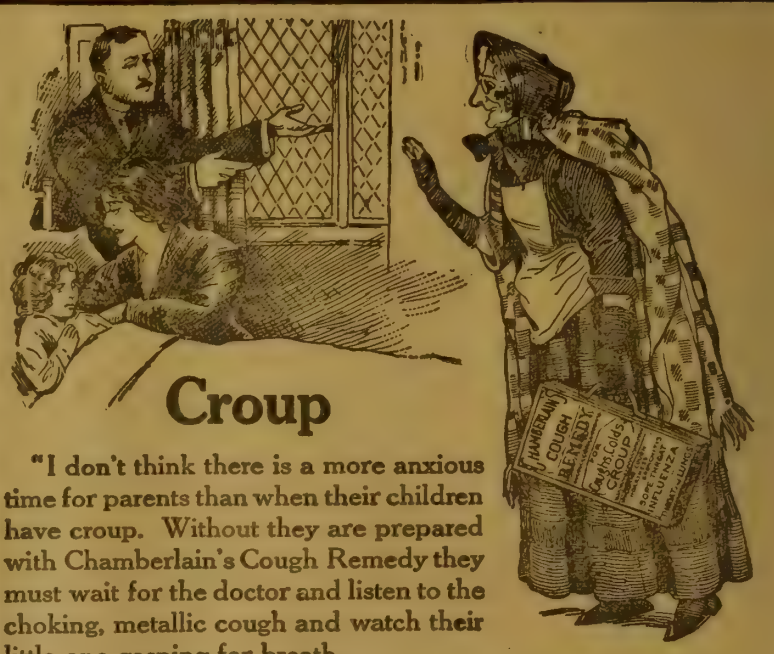
The Association of Canadian Seed Growers has accomplished a marvellous change in the attitude of the public towards an appreciation of good seed. There remains, however, the mass of the farming community to be educated to action in this matter of using the best seed obtainable.

To attain efficiency in the matter of crop production and improvement there can be no such thing as profitable production following the use of inferior or cheap seed. This does not imply that seed is inferior because it is cheap any more than that seed is the best because it is highest priced, though usually good seed is high priced, so too are all quality articles, though such are eventually cheapest.

Only when crop growers fully realize that in the production of any of our field crops the cost of good seed, —even the best seed,—plays the smallest part in the items of cost of production, will there be a determination to have the best seed obtainable. Only then will the efforts of the grower of good seed meet with their just reward,—a demand for his seed, prompted because of an appreciation of its worth by crop growers in general.

Farmers have been slow to apply those principles so generally used in the improvement of their live-stock to the improvement of their farm crops. They have restricted the axiom "breed only from the best" to stock improvement, under the impression that plant-breeding or plant improvement is too trifling a business to reward any effort spent in that direction.

It is, nevertheless, a fact that these same principles of stock improve-



"Granny" Chamberlain

Croup

"I don't think there is a more anxious time for parents than when their children have croup. Without they are prepared with Chamberlain's Cough Remedy they must wait for the doctor and listen to the choking, metallic cough and watch their little one gasping for breath.

You know the great danger of croup is the formation of a false membrane in the larynx, and until this is expelled relief cannot be obtained, and the spasmodic choking continues. Give Chamberlain's Cough Remedy in frequent doses. It will loosen this membrane and cause the child to expel it by vomiting.

Chamberlain's Cough Remedy

is an absolutely safe and certain remedy for croup, and if given as soon as the child becomes hoarse, or even after the croupy cough appears, it will prevent the attack."

Yours for Health —Granny Chamberlain

29

ment, when applied to the improvement of plants, are equally effective, they are sooner productive of results and are more cheaply applied; while the rewards consist of more than the empty glory accorded him "who makes two blades of grass grow where but one grew before."

To the possibilities of selective-breeding, intelligently carried on upon the average farm, little attention is paid. Individuality in plants is scarcely recognized as being a tangible fact, though with such evidence as is furnished by the popularity of Marquis wheat, which originated from a single cross-bred kernel, and the Green Mountain potato, which originated from a cross-bred seedling, there can be no doubt that individuality is present and that individuals which display characters which are desirable can be made to be of great service by propagating them apart, for the expression of such characters transmitted to the progeny can be regulated by selection. Such restrictions by selection of expressed characters within a variety constitute "line-breeding."

By such methods "strains" or "races" among different cereals have been bred, while "clons" have been likewise originated from plants which are vegetatively propagated; ex., Potatoes.

The value to the agricultural industry of the discovery and breeding of such improved varieties of farm crops as have been mentioned is almost inestimable, likewise the value of the increased crops which may be secured through the use of well graded seed,—sound, plump and prolific.

Now, when acre-profit is the basis for an efficiency status among farmers and an increased production of agricultural products is called for, is there any other means likely to be so potent of results as by the sowing, growing and selling of good seed?

If we could comprehend the vast influence of seed selection in raising the productive value of agricultural plants and its value as a fundamental of crop improvement in the attainment of a more efficient and profitable agriculture, it would be reasonable to expect a display of community spirit in the problems of crop improvement and seed production, with the establishment of a seed centre, where a community produces chiefly a particular variety of any class of crop, and in this way facilitate the sale of their product as seed-growers.

EIGHT EGG POINTS

1. Grain (scratch food) and ground feed (mash).
2. Animal food, such as beef scrap or sour skim milk.
3. Grit and oyster shell.
4. Green food.
5. Clean, fresh water.
6. Liberal feeding.
7. Plenty of exercise.
8. Regular attention.

Hens eat from five to eight pounds of food a month, or 60 to 80 pounds in a year. The daily food eaten by a hen is from three to four ounces. The daily ration for 100 hens is from 19 to 25 pounds.

Hens drink about six pounds of milk a month. One hundred hens drink 2½ gallons of milk daily.

On limited range, a laying hen eats two pounds of grit and three pounds of oyster shell in a year.

The next time you make any kind of a contract put it in writing. It may save you considerable worry and expense.

Another Cup, Please!

INJURIOUS BITING INSECTS IN N. S. APPLE ORCHARDS

(Continued from page 291)

history, now familiar to most of your,

A brief account of this insect's life is as follows. The winter is passed in the egg stage, the eggs being found in white, froth-covered masses adhering closely to the cluster of dead leaves which protected the pupal case of the female. These hatch in late June and the young feed on the leaves and fruit for a period of about six weeks when they pupate, the pupal case being formed in a cluster of one or more folded leaves. When the fruit is attacked, the caterpillars do not eat into the flesh, but gnaw away a shallow, spreading, much scalloped cavity which is superficial rather than deep, differing in this respect from the work of the green fruit worms which consists typically of a more or less round, deep, cavity chewed right into the side of the fruit and not spreading and scalloped as is the case with the Tussock moth work. About the end of August the adults emerge, the males winged, the females wingless. For this reason the female very seldom moves from the old pupal case but lays her eggs on the outside of the protecting leaves, covers them over with a white froth and drops to the ground.

The best means of control is the use of some arsenical spray when the larvae are very young and ,where practical in small orchards or on small trees, the gathering of egg masses when the trees are dormant.

The Canker Worm

This insect, like the Tussock Moth, is periodical in its occurance and is controlled naturally by parasites but usually not until great damage has been done to the orchards which it infests. During 1915 a great many orchards were almost totally defoliated and during the past season conditions were even worse. Reports from the brown-tail moth inspectors and from individual orchardists go to show that the coming year will likely see the worst outbreak of canker worm that we have had for ten years or more. The Granville section, the section between Bridgetown and Middleton, Nictaux and the territory between Kentville and Horton are the most heavily infested. In all probability in 1917 the pest will reach its maximum but it possibly may run another year and be even worse in 1918—which is not a pleasant prospect.

Doubtless you are all now familiar with the life history of this insect so it will be sufficient to remind you of a few of the more important points only. In late October and November the adults, which have been pupating in the ground, emerge and as the females are wingless they are forced to ascend the trunks of the trees in order to deposit their eggs on the twigs. It is at this period that the tanglefoot bands do their work. The eggs, laid on their bases in regular clusters, are found usually on the smaller branches and twigs and commence hatching in the spring about the middle or end of May. The ascent of the females in the fall and the hatching of the eggs in the spring are the vital points in this insects life history, as far as control measures are concerned.

Control.—There are two important remedies which if carried on at the right time and in the right way will control canker worms in any orchard. (1- The application of a strong arsenical spray immediately after the caterpillars hatch, or just before the blossoms and (2) the banding of the trees in the fall before the adults ascend the trees to lay their eggs. The commercial tanglefoot, sold by the United Fruit Company, gives better results than the homemade article and is therefor recommended.

"The Best Marmalade I Ever Made"

Select fresh, clean-skinned Seville oranges for their wholesome bitter zest, and spicy sweet oranges for their fragrance and flavor. Tell the grocer to send with them a bag or carton of

Lantic Sugar

the pure cane sugar which you will find best for marmalade and all preserving. On account of its very "FINE" granulation, Lantic Sugar dissolves instantly, making crystal clear syrups and bright, firm jellies.

MARMALADE without weighing

Slice six bitter oranges and seven sweet oranges and add three cups of cold water for each cup of the fruit pulp. Let stand for 24 hours in a glass or porcelain vessel, then bring slightly to the boiling point and boil for 15 minutes. Set aside for another 24 hours. Then measure five kitchen cups full of the fruit into a preserving kettle and boil briskly for about an hour. Add a 2-lb. carton of Lantic Sugar, which will need no weighing as it has been accurately weighed when it was packed.

Note: This quantity makes nearly 5 pounds of marmalade. It is better not to cook more than this at one time as the long cooking tends to darken it.

Don't buy sugar by the "quarter's worth" or "dollar's worth." Buy Lantic Sugar in our full-weight sealed packages. Weighed, sealed and packed automatically at the refinery. No hand touches it but your own.

"The All-Purpose Sugar"

10, 20 and 100-lb. Sacks
2 and 5-lb. Cartons

A CLEAN MOUTH PROTECTS HEALTH

(Continued from page 303)

Granting now that the rising generation, by taking advantage of dental care and constant cleansing, are to be spared the distressing conditions of the teeth which give rise to pyorrhea. foul breath, impaired digestion, rheumatism and even valvular heart disease, what are we of advanced years to do whose wisdom teeth were cut before any of those discoveries were made or any of this good advice promulgated?

We have made one step when we accept the discoveries as probably correct and consider the possibility of their personal application. This comes with especial force to the person who has long been annoyed with some persistent chronic ailment pointing to a concealed infection. This may manifest itself as rheumatism, as a troublesome eczema, as a persistent headache, repeated attacks of asthma or even inflammation of the kidneys or heart.

If with such a condition there exists the slightest suspicion of diseased teeth or gums there is every reason to secure prompt attention, with the cheerful hope that attention to the teeth will cure or at least relieve the associated disease.

THE EGG SITUATION

(Continued from page 299)

not only for the present, but in the days of adversity which are apt to come following the war. Agriculture is Canada's basic industry. Her own local demands are relatively small. She must find her place in the markets of the world. Even among her allies will be found some of her keenest competitors with respect to certain of her national crops, but in the production of live stock and live stock products, of which poultry is taking an increasingly important part every year, we have in Canada, assets in our herds and flocks of purebred stock and in the higher civilization of our people, that which, if properly applied and developed in the most progressive, business-like manner possible, will insure Canada and Canadians that prosperity which we hope and believe is the natural heritage of this fair Dominion.—By W. A. Brown, N. S., Live Stock Branch, Ottawa.

THE IMPORTANCE OF PLANTING VIGOROUS SEED STOCK

(Continued from page 287)

the lack of vigour in his stock and get rid of it, but it is impossible to determine the difference between some of the strains until they are brought together side by side. We no doubt will have a fluctuating variation within strains of a variety and it would not be wise to drop out all except the highest one tested, but it seems we could safely reduce the number to the fifty bushels difference in range.

The results so far would seem to point to a very practical way whereby a community with the least possible help from outside sources can vastly improve their standard varieties of potatoes. The best of a community could then be brought together at a central station and there further tested and outstanding strains developed for general distribution for seed purposes.—An address by Prof. W. S. Blair at the N. B. Potato Growers' Convention.

"Empire corrugated Iron"

"EMPIRE" Corrugated Iron is made with deep corrugations fitting closely and snugly; it makes a splendid, strong, rigid wall that withstands all storms. Remember—building with Metal gives you fire-proof, weather-proof and lightning-proof buildings.

Our "Metallic" building materials—the "Quality First" kind—may cost a little more than other building materials, but they're permanent. "Eastlake" Galvanized Shingles; "Metallic" Ceilings; "Metallic" Rock and Brick-face and Clapboard Siding; Roof-lights and Ventilators, Silo Tops, etc., save you money.

"I could not have done without it this Summer, as help is so scarce"

Here is the experience of one of the scores of dairy farmers for whom the

EMPIRE
Mechanical Milker

is taking the place of the farm help they can no longer get, and enabling them to keep their herds together and take advantage of the prevailing high prices.

R. R. No. 3, INGERSOLL, ONT.

Gentlemen:—

I have used one of your "Empire Milkers" since early last April, or from about 45 cows continually, and can find no injurious effects on the cows. They seemed to like it from the first time, and I think gave rather more milk than with the best hand milking. Easy cows seemed less inclined to leak, and hard ones gradually became easier.

I have sent the milk a number of years to the Borden Condenser Company, and have had no complaints. I have just followed the instructions for keeping it clean.

I could not not have done without it this summer, as help is so scarce. I may say further that I have been milking cows for over 50 years, and have been in the milk business nearly that length of time. I have had no previous experience with milking machines, but have had very little trouble or expense for repairs. I have used it on heifers never milked before, with perfect satisfaction, no matter how small their teats were.

The Milker has been of more practical value to me than I ever expected.

WILLIAM COLYER.

We will be glad to send you Booklets showing exactly how the Empire Mechanical Milker works, and telling the experience which dozens of prominent dairy farmers have had with it. Address Dept. L

SMALL FRUITS

(Continued from page 287)

with couch grass and barnyard manure applied at the rate of 40 to 50 tons per acre in the fall and plowed in, this will give the weeds a chance to germinate before planting the strawberries in the spring and also conserve the moisture. Commercial fertilizers will in conjunction with a conserve the moisture. Commercial fertilizers will in conjunction with a clover sod take the place of barnyard manure but it will be found more expensive and has not the same physical effects on the soil. As the manure helps to retain moisture and the bacteria of the manure puts the plant food in an available condition much quicker because a clover sod is apt to be infested with white grubs. The soil should be worked as early in the spring as possible before planting, so that the weeds will be given a start and thus killed by the cultural methods just previous to planting. A light dressing of bone meal or wood ashes may be applied at this time. Be sure and cultivate thoroughly two or three inches deep so that all manure is thoroughly incorporated with the soil. Remember that the soil cannot be in too fine tilth for the young plants. If the soil is rather dry on top rolling the land at this time will bring the moisture to the surface and also make the task of marking the rows easier. Mark off your field with rows four feet apart and one foot between the plants in the row. In selecting your plants select only the best. Don't take the plants from the edge of the row where the last plants formed the previous year are situated most of which, owing to the lateness in their forming are deficient in a good root system, but dig up all the row is necessary and take only the plants with a good vigorous appearance and possessing large white healthy roots. The strength, health and vigor of your plants may be much improved by selecting, a few hundred of your best plants and setting them in a row or two where they can be given the best of care for your planting the year following. There is just as much individuality in the strawberry as in the apple. Select your plants as you would your trees. Do not allow your plants to wilt before planting if it can be avoided. The quickest and best way to plant strawberries is by using a spade, a man and a boy are needed in the operation. The man with a spade walks backward following the marks and with the spade makes a three cornered hole into which the boy places he plant holding it firmly while the spade is removed. The foot is then used to pack the soil firmly about the plant. The duty of the boy is to place the plant at the right depth, just so the crown of the plant is even with the surface of the ground.

Cultivation should immediately follow the planting and must be thorough and continuous throughout the season as the coming crop of fruit depends on the vigor of the parent plants. The early cultivation's should be quite deep and gradually grow shallower as the season advances as the soil dries to the depth of cultivation and the plants (young runners) do not set well if too far from moisture. The man with the hoe can do much to increase the yield of the crop by carefully placing the runners in the proper direction and not allowing them to grow prosmiscuously, also picking off all the blossoms as they appear.

With our alternate freezing and thawing during the winter and spring mulching is necessary. This can be done either with strawy manure or straw that are free from weeds and weed seeds. Apply it as soon as the ground is frozen. In the spring rake the mulch between the rows where it will conserve moisture and keep the fruit clean and free from dust. Don't remove it too early wait until you see the leaves start, and you will thus avoid spring frosts. Only one crop pays.

The choice of varieties for commercial planting is very important. Some varieties seem to be adapted to sandy soil and very warm conditions generally, while others seem to prefer heavier soil and cooler conditions. A variety that does exceptionally well on one farm may not do well on another a short distance away. Each grower must select for himself the variety that is best suited to his soil and conditions. No one can select this variety or varieties for him. He must find this out for himself from test plots or rows or from experience.

Strawberries are divided into two classes according to their blossoms, perfect and imperfect. The perfect flower has both pistil and stamens and is able to fertilize its own blossoms, but with the imperfect flower the stamens are wanting and hence cannot be fertilized unless a perfect variety is planted beside it to fertilize its imperfect flowers. Therefore care must be used in selecting the varieties you plant to be sure you do not plant imperfect varieties without some other perfect variety to supply the pollen for these imperfect blossoms. Do not plant your perfect variety one side of the plantation and the imperfect on the other, if planting imperfect varieties plant one row of perfect to every three rows of imperfect. The best varieties we have found on the farm at Kentville are the Senator Dunlop (perfect) Pocomoke (perfect) Sample (imperfect). The yields from these three varieties for the last two years are as follows,—

	1915	1916.
Senator Dunlop	5185	6222
Pocomoke	5202	5619
Sample	5661	5193

Raspberries and Blackberries.

They need a cool moist well drained soil which is not too rich in nitrogenous fertilizer as this class of fertilizer produces an excess of wood or cane growth. Barnyard manure at the rate of from 10 to 20 tons every two years according to the soil conditions is the standby of all the old growers. A dressing of bone meal is also beneficial occosionally. Raspberries are propagated by suckers, these are young plants that come up between the rows of the plantation after the last cultivation. Select the largest and best of these for your new plantation. Do your planting in the spring. Plant them 6 feet apart between the rows and 3 feet in the row. This allows cultivation in both directions. The hill system is recommended for the following reasons. It makes cultivation easier and cultivation conserves moisture. It allows more sunlight into the ripening fruit. It makes the gathering of the fruit less difficult. It also increases the size of the fruit. Clean cultivation throughout the season is essential to the best results. Fall plowing up to the plants for winter protection and this being hoed back in the spring to remove the weeds and form a mulch is recommended. Careful pruning is necessary. The fruit is borne on the wood produced the previous season therefore after the second year it is important to remove in the early spring all canes that have borne fruit and also all but five or six of the best new shoots. To reduce the expense of the first year a crop of tomatoes, beans, cabbage or some hoed crop may be planted between the rows. The yields at Kentville are as follows,

Herbert Raspberry 1915 4445 quarts
No. 4 Seedling Raspberry 5123 quarts
Minniwaski Blackberry 2973 quarts

Currants and Gooseberries

Currants and Gooseberries thrive best in a cool rich moist soil, preferably a heavy clay loam that is well drained. Like the other bush fruits they require a soil with plenty of available plant food which is at the present time best supplied by liberal applications of well rolled barnyard manure. These fruits are best planted in the autumn say September, because it is difficult to get them into the ground early enough in the spring. Plant in rows 6 feet apart and 4 feet apart in the row. Be sure they are set deep enough and the soil well tramped about the roots. After planting cultivate immediately. Clean cultivation throughout the season is very important to hold the weeds in check and retain moisture. After the plantation comes into bearing, dressing of barnyard manure should be given every other year.

In conclusion I would not recommend any one to go into the commercial growing of this last class of small fruits without first trying them out on a small scale, but I would recommend every farmer and fruit grower in these Valleys to plant enough bushes on his own farm to supply his own demands. By this practice each farmer will get the experience in growing them and then if he so desires he can go into them commercially.

But the commercial production of the strawberry and raspberry are entirely different, with these we have the ease of culture. The market demand and the facilities for marketing besides good prices. Therefore let us endeavourn to make the commerciay growing of small fruits in the Annapolis and Cornwallis Valleys one of our chief horticultural industries of the provinces.

THIS MAY BE WHAT YOUR HENS NEED

Hens cannot lay consistently unless they have the right feeds in the right proportions. The following are rations for winter feeding:

1. Scratch food—1 part wheat, 2 parts corn. Mash (ground food)—1 part bran, 1 part middlings (shorts), 1 part corn meal, 1 part commercial beef scrap.

2. Scratch food—2 parts corn. 1 part wheat. Mash—ground oats, butter milk or sour milk as a drink.

The parts in the rations are given by weight and not by volume. Other factors are met in egg production, and it may be that proper feeding will not produce desired results. However, desired results cannot be obtained without proper feeding. The ration is one of the important factors in egg production which can be controlled. Certainly the man who feeds for egg production will receive more eggs in a year than the man who follows no systematic feeding plan.

GRASPING PRESENT DAY PROBLEMS

The great, dominating thought ever present in the mind of every one of us is, "How long will the war last, and what effect will its close have upon our trade and other conditions?" We cannot answer either of these questions, but we can all lend our aid and assist very materially in hastening the end by the sending overseas such of our young men who have not already announced their willingness to go and who can be spared from the country's industrial activities, and we can be prepared for whatever eventualities the close of the war may bring forth if we continue to maintain our farms and orchards in a high state of cultivation and to increase the quantity and improve the quality of our products.

At this distance it is impossible for us to even in a small degree appreciate the significance of the titanic struggle now engaging the attention of the whole world. The results are bound to go to the very roots of civilization. The focus of our views as affecting our relations with the whole human race will be changed. What a wonderful thing it is—great beyond the possibility of our imagination—that we here to-night are a part, an integral part, of a nation less than fifty million people, who when the war was declared had no army, no munitions, no preparation of any kind commensurate with the task to be undertaken, and yet who in less than three years has placed at the front and in readiness for the field the greatest army the world has ever seen, and made ready for war munitions in such volume as to stupify and daze the mind of the many who had spent forty years in preparation for the struggle. Think of the ocean lanes kept open, over which the commerce of continents passes without molestation; think of the financial strength, growing stronger every day; think of a thousand and one things all indicating hidden strength and a resolve to do the right; and let us thank God we are permitted to live in such an age and have some part in the righting of the greatest wrong ever perpetrated upon the human race.

We should not listen to pessimistic utterance regarding lack of market or scarcity of tonnage, but rather should exert every effort to increase our production and improve its quality. The geographical location of this valley and its nearness to the United Kingdom are factors which mean a continuous and ever widening market for the quality of fruit you are capable of producing. The Nova Scotia apple is famous the world over; but you growers have a grave responsibility in this respect. Be very careful that you give heed to the quality rather than the quantity if you would maintain the high standard of the past. Quality makes a splendid selling agent. Investigation last year indicated that with a normal crop there is a splendid opening for your famous Gravensteins in New England. This is a matter I think your organization could follow up with advantage.

The scarcity of certain fertilizers, or the impossibility of obtaining them at the prevailing high prices, should not be permitted to discourage you in the matter of cultivation, but should prove a strong incentive in the direction of mixed farming, in the development of which you would become more and more independent of artificial fertilizers and make for more permanent success.

This is a time when we should, as communities and as individuals, exercise more thrift. We should not waste the products of our orchards, as is frequently the case. We should make a closer study of the methods whereby our inferior fruit can be preserved. Thre is an ever growing market in the great North West for all varieties of canned as well as fresh fruits. The opportunity is yours.

The labour question is recognized as a serious one, and is a matter requiring careful study. In many sections the shortage has been offset to a greater or less extent by the use of dynamite in tree planting, breaking up new ground, etc. The use of gasoline tractors in the cultivation of the soil has also been introduced with marked success. We have now in our possession, and are arranging for many more, moving picture films depicting modern methods of orcharding, planting, cultivating, etc., and during the winter these will be shown in various centres so that every grower may have the benefit of the experience gained in other quarters. Another feature whereby the labour conditions on the farm might be very materially improved would be by making the life thereon more attractive, especially for the young. There are many cases where the young men growing up on the farm feel that they should be given some definite return for their labour.

In 1914, you had in Hants, Kings, Annapolis, Digby and Yarmouth Counties approximately 32,000 acres of orchard. At forty trees to the acre, this would mean 1,280,000 trees, and at a barrel to a tree (not a large average) would mean that many barrels of fruit. This figure has never been equalled except in 1911. In view of the fact that fruit trees, like other natural products, either improve or deteriorate, there would seem to be food for serious thought as to the reason for the continued low average crop, and a real necessity for definite action in order to preserve and improve the most valuable asset found in the fruit trees of this delightful valley. If it is spraying, pruning, cultivation of what not, let us grasp

"Only for the Teeth Have We Learned to Take Precaution in Advance of Pain."

Experience has taught us that to wait for the toothache warning is to allow irreparable loss to be done.

But why do we not apply this lesson in caring for the general health, and by keeping the blood rich and the nervous energy at high-water mark, reduce sickness to a minimum and prolong life ?

There are many symptoms to warn you of the weak, watery condition of the blood and exhausted nerves, and by the timely use of Dr. Chase's Nerve Food it is not difficult to restore richness to the blood and feed the starved nerves back to health and vigor.

But just as the tooth cannot be saved after decay has gone too far, so the nerve cells can never be replaced once they are dead.

On this account it is a thousand times better to be warned by sleeplessness, headaches, indigestion, tired feelings and muscular weakness rather than to neglect treatment and allow nervous prostration, locomotor ataxia or paralysis to develop.

That Dr. Chase's Nerve Food is the greatest of nerve restoratives is being proven every day, and you will find the evidence in the daily and weekly papers.

50 cents a box, 6 for $2.50, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

Do not be talked into accepting a substitute. Imitations disappoint.

533

Dr. Chase's Nerve Food

the problem with vigor, in order that we may take and maintain the place intended us by Nature—the finest and best fruit growing country in the world.

An address by Geo. E. Graham, manager D. A. R., Kentville, N. S., before the N S. F. A at Lawrencetown.

ANNUAL MEETING CANADIAN AYRSHIRE BREDERS' ASSOCIATION

(Continued from page 293)

olution passed at the last Annual Meeting, governing the disposition of Diplomas to bulls that qualify in the Record of Performance test, cannot be successfully carried out, therefore, be it resolved that the Diploma be sent to the breeder of the bull qualifying, or the importer, in the case of an imported buil, and any owner may secure a copy, on application to the Secretary, and on payment of fifty cents. In the event of the breeder being dead, out of business and the herd dispersed, that the Diploma go to the first owner.

Resolution re War Loan

"That the Secretary be instructed to invest $4,000. of our surplus funds in the next war loan issue."

How many farmers know that a nail can be driven into hard wood much easier if first rubbed with lard.

DELCO-LIGHT

ELECTRICITY FOR EVERY FARM

The Greatest Boon Since the Self-Binder

Life in the country has taken a wonderful step in advance with the coming of Delco-Light. Nothing since the self-binder has meant so much to the farmer and small-town dweller. Here, at last, is complete and economical electric light and power for every home that is now without it. No home in the world will now be more worth living in than that of the progressive farmer. Nothing that the big city offers is now beyond your reach. With Delco-Light country life becomes the preferred. It brings every comfort and convenience to the farm—saves money, time, labor for all the family.

Electric Light and Power

Here is Delco-Light—electric light—clean, brilliant, safe. Delco-Light goes everywhere—all over the house, in the barns and sheds, outdoors. Clear light, best for work and eyes. Clean light, without the labor of cleaning lamps and lanterns. Safe light, with no danger of fire.

Delco-Light is a pleasure, a convenience, almost a necessity. But Delco-Light power is even more. It earns its way. With the Delco-Light Power Stand you can do much of your chores by machine. Saves hours of time in milking, separating, churning, feed-cutting, washing, pumping water.

Delco-Light is the most compact, efficient and simple electric-lighting plant yet developed. The main unit consists of a switchboard, combined electric motor and generator, and a gasoline engine. The other unit is a set of storage batteries. Each part is the simplest of its kind that will work efficiently. Little operating is called for, little adjusting. The engine is self-starting by pressing down a switch. Stops automatically when batteries are fully charged. Price of No. 208 is $390, and No. 216 is $465.

COMPLETE USE OF ELECTRICITY

The Delco-Light Power Stand will increase the usefulness of your electricity 100%. It is a compact, sturdy, efficient portable motor, saving of current. Take it anywhere. It runs from the nearest light socket. It will operate all kinds of light machinery, saving you hours of time and labor.

FREE **FULL INFORMATION**—We have prepared several intensely interesting books telling all about Delco-Light—how little it costs, how much it does, how easy it is to install and operate. Send your name and address for these books free.

Domestic Engineering Co., DAYTON, OHIO

CARE OF EGGS FOR HATCHING

Eggs for hatching purposes are preferably not held over two weeks. The fresher they are when put in the incubator, the better. They need to be gathered often to prevent chilling in the nests. A mixture of various sizes and shapes is a sure guarantee of indifferent results. Dirty eggs also are to be avoided, as the pores in the shell of such eggs are closed up, thus preventing proper entrance of fresh air or the escape of gases from the egg. Washing and drying with a cloth destroys the cuticle of an egg cloth destroys the cuticle of an egg, and permits too rapid evaporation of its moisture.

As a rule a hen lays eggs of about the same shape continually and in general the shape of eggs is transmitted to offspring. Good market eggs are normal size and uniform; hence the necessity of breeding from hens producing such eggs. Eggs for incubation are held at a temperature of 50 to 55 degrees. At a room temperature of 68 to 70 degrees they will start to incubate. If best results are to be secured the eggs are candled. By this method cracked and developed eggs are eliminated. When eggs are held for hatching it is not necessary to keep the large end up as they will keep just as well as on the sides. When kept over a week it is advisable to turn them once a day. No eggs are saved until the male has been with the females seven to 10 days.—F. D. Crooks.

FENCE BUYERS---NOTICE

Our prices are the lowest it is possible to name, quality of fence considered. To make a less price quality would have to be sacrificed. We think it only fair to give the public this statement.

Of course, if one would just as soon have a low grade or off grade fence, he can buy the kind sold at a low price. That is his affair. If, however, good quality and permanency is desired in a fence he should buy ours or a similar good grade, at the small extra cost necessary.

There is a lot of high quality fencing being sold this year.
Fence buyers are evidently learning to discriminate.
Our 1917 prices and printed matter is now ready for you.

NOVA SCOTIA COUNTY LEADERS

One of the most important developments of the agricultural policy which the federal grant for the aid of agriculture in Nova Scotia has enabled the Provincial Department of Agriculture to establish, is that of placing agricultural leaders in various counties of the province.

The late Dr. C. C. James, agricultural commissioner for Canada, considered the establishment of this system of what he termed county representatives, first in Ontario and later in other provinces of the Dominion to have been the crowning achievement of his career as agricultural advisor to the governments whom he served.

In Nova Scotia, all the counties have not yet been brought under this scheme, but in the Cape Breton counties and in Antigonish and Guysboro, there have been placed six men, sometimes aided by assistants, whose work it has been to go right out on the fields of the farmers and by example as well as precept, encourage improved methods of agriculture. The movement is a new one in the province and it is yet too soon to chronicle great achievements. Nevertheless, we feel sure that brief review of the salient features of the work will be of interest to at least those readers who appreciate the importance of developing agriculture in Nova Scotia.

The leader of this county work in Cape Breton is H. S. Cunningham and a great worker and leader he is. Associated with him during the past season were H. B. Langille and Thomas Munn. All are students or graduates of the Nova Scotia College of Agriculture. Mr. Cunningham, the chief, has been supplied with a motor car, in which he has gone as an agricultural missionary, into every corner of Cape Breton from Arichat to Cape North. In addition to this trio, the department has been fortunate in enlisting the services of Rev. Father Robitaille of West Arichat, who has already achieved splendid results on Isle Madame.

* * *

While these men in Cape Breton have aimed to stimulate every branch of farming, yet their greatest effort has been directed toward the encouraging farmers to keep more and better cattle and sheep and other live stock. They might have tackled this problem from several angles but after inquiring carefully into the reason why more progress was not being made, they found that the lack of suitable feed and sufficient quantity of it was the stumbling block. Over in Scotland, which is a sort of prototype of Cape Breton, this difficulty has been largely solved by the growing of acres upon acres of turnips or as they are termed over there "neeps", which crop more than any other single crop has enabled the hard headed canny Scotch farmer to keep one head of cattle to every four or six acres and big flocks of sheep besides, whereas in Nova Scotia the average is one head of cattle to every twelve acres of cleared ground and an all too small extra of sheep.

And so a big part of the work of these men has been demonstrating the best methods of growing turnips on specially selected plots on typical farm lands of the country and giving assistance to any and all farmers who wished to improve their methods of growing this crop. Such a pronounced feature of their work has this turnip growing been that in some parts of the island, Mr. Cummingham, like his associates, is known as "the turnip man."

It may be that if Mr. Cunningham and his allies had gone in for something more spectacular, even if it were superficial, this article might appear more sensational. But the praiseworthy feature of the work has been the effort of these men to get right down to fundamentals. They have not, however, stopped at the turnip crop but they have made this crop the basis for tests with various commercial fertilizers, seaweed, fish refuse and manure, and they have insisted that in succeeding years the turnip land must be systematically rotated, which is one of the great requisites in economically growing crops of all kinds.

Before leaving the turnip subject we may add that hundreds of growers of this crop will earn with interest that by the fall application of lime on some of the Cape Breton demonstration plots, known to have been infested with that exacting scourge of the turnip "club root", the disease we almost completely conquered. Similar treatment of fields elsewhere will save thousands of bushels of turnips that heretofore have been destroyed by the disease.

* * *

Working along similar lines these men have interested many farmers in the newly established creameries at Baddeck and Margaree and so have helped them to realize more money from the product of their cows. They have brought to the Island improved seeds and they have encouraged many growers to save part of the product of this seed for future sowing. They have given advice as to drainage, the cultivation of difficult fields, what to do with cattle and other live stock under various conditions and many other phases of the farm economy. But the most important thing they have accomplished has come about through their stimulating an interest in farming among the young-

A Car of Proven Quality

HE Ford car has been on the market twelve years, surely long enough to have proven its high quality. There is nothing experimental about it. Every part has stood the test of time and proven its stability with hard service. No other car has ever approached the durability records of the Ford.

No matter what price you pay for a car you cannot get one with a stauncher chassis. Government Laboratory tests have shown that the different parts of the Ford car are superior to those in any other car. Ford Vanadium steel has never been equaled in strength.

If you want a car that can plow through deep mud, sand and gravel—that can cross fields, corduroy roads and ford streams—that can climb the steepest hills with ease—that will give the greatest mileage all year round with the least expense and care—then there is only ONE car for you—The Ford.

er people of the Island. Away down in Ingonish, for example, where fishing is the paramount industry, a competition in gardening among the school children was inaugurated and in the fall a School Fair was held at which some 350 exhibits of garden and farm products were made by the scholars. Some of the older people report that nothing attempted in the interest of agriculture in that part of the counry has been so successful as this work directed through the local schools.

* * *

On Isle Madame, Father Robitallie has achieved wonders. At the County Exhibition held in Arichat this fall, one of the speakers stated that, whereas the usual custom was for schooners from Prince Edward Island to bring their loads of farm produce to Isle Madame, this year a schooner had been loaded with potatoes, cabbage, and other farm and garden produce at D'Escousse on the island and shipped to Sydney, and he added that for this great achievement Father Robitaille was responsible. Father Robitaille's ambition is not to make farmers out of every resident of the island but to get every fisherman to grow some crop and to induce the bigger holders of land to farm more extensively.

He is an untiring worker, an enthusiast and has achieved results.

He goes right out on the farm and when necessary puts in crops himself and so demonstrates by his own example the proper way of doing things. Last year was his second year of this work and such was the demand for his services that an automobile had to be secured and so the area of his influence has been extended. Father Robitaille is certainly making history in Richmond county.

In Antigonish, Dr. Hugh McPherson, the capable county agent, is known from one end of the county to the other. He is especially interested in helping farmers to use the most effective fertilizers and to sell their products to the best advantage. Last spring, largely through his instrumentality, farmers in Antigonish and Guysboro counties marketed their wool under the up-to-date graded system and netted from 5c to 10c a pound more than those who marketed their wool in the old fashioned way.

Dr. McPherson is a quiet undemonstrative worker and the farmers have great confidence in his. Through his instrumentality two short courses in agriculture have been conducted in the demonstration building, which has been erected for the purpose of further carrying on county educational work, in the Town of Antigonish.

* * *

In Guysboro county, the agent, A. B. MacDonald, a graduate of the Nova Scotia Agricultural College, and of St. Francis Xavier as well, has accomplished wonders in the six months since he has gone there. He has established tests with various fertilizers and with ground and burnt lime. He has conducted demonstrations in sheep dipping, potato spraying and in the growing of all kinds of crops; he has helped in the co-operative marketing of wool; he has established competitions in gardening among many of the scholars attending the local schools of the county; he has organized farmers into a County Farmers' Association and if they carry out their proposed campaign they will accomplish much for the advancement of agriculture in the county. Not long ago we met a potato grower in Guysboro, who said that MacDonald had sprayed two-thirds of his potato plot with a special Bordeaux mixture for the purpose of preventing rot. The grower told us that on the sprayed two-thirds of this field there was scarcely a single rotten potato, whereas on the unsprayed portion from a third to a half of his crop was more or less affected with rot. Farmers in this part of Nova Scotia will spray their potatoes next year, said this man, on whose farm the demonstration was carried on. Mr. MacDonald had also had placed at a central point a modern grain fanning mill and many farmers who have heretofore either sown their seed as it came from the field, or oft times purchased the lower grades of seed on the market, will this year save some of their best oats and wheat, etc., and put it through the fanning mill and so get an A1 quality of acclimated seed which experiments at Truro have shown will give the best results.

* * *

The development of the county agent system has been temporarily retarded because of the scarcity of men due of course to the demands of the war. Nevertheless, the department of agriculture is providing for the extension of the system. In several counties of the province demonstration buildings, so called, have already been erected which will form headquarters for this work.

The idea is right involving as it does the principle of bringing the gospel of improved agriculture right to the doors of the farmer. It has accomplished much in other parts of the world and is sure to prove a means of great advancement in the province of Nova Scotia. If the Federal grant was thus far, responsible for nothing more than introducing this county agent system into the province of Nova Scotia, it would have been well spent.

It is impossible to put up a valid excuse for the ownership of poor land.

Hawaiian Music---the Hit of the Day

THE rhythm, the swing, the tuneful charm of Hawaiian music is the inspiration of most of the song and dance successes that the country is wild about today.

Here are the biggest hits of them all :

MY HAWAIIAN SUNSHINE
Columbia Record A2154, 85c

"My Hawaiian Sunshine," sung by Sam Ash and Robert Lewis, tenors, is a record that will make an instant hit with you—a rich "Hawaiian" blending of male voices, a tuneful melody, plus a singing guitar to furnish a delightful Hawaiian accompaniment! On the reverse Al Jolson himself sings the big London success, "The Broken Doll."

MY LONELY LOLA LO
Columbia Record A5914, $1.25

"My Lonely Lola Lo" is a pulse-stirring fox-trot, guaranteed to make almost anyone dance—clicking castanets, rhythmic bell-passages, and the band music so good you just can't resist it. "The Dance of the Dollys," on the reverse, is a fox-trot that made as great a hit as the famous "dancing twins" it has been named after.

YADDIE, KADDIE, KIDDIE, KADDIE, KOO *Columbia Record A2151, 85c*

The "real thing" in Hawaiian music, even to the soft guitar accompaniment—a song of Hawaiian landlords and love, sung with infectious, gay enthusiasm by the famous Knickerbocker Quartette. On the other side; "'Twas Only an Irishman's Dream," splendidly rendered by the famous Empire Trio.

Ask your Columbia dealer to play these and other popular hits—and then you will know why people are buying *Columbia* Records of popular hits. "Hearing is *believing!*"

Volume 22. SUSSEX, NEW BRUNSWICK, MARCH 20, 1917. Number 12.

OFF CROPS AND THEIR CAUSES.

By W. T. Macoun, Dominion Horticulturist

The short crops which are experienced more or less frequently in all parts of Canada are very disappointing and discouraging to the fruit grower. No matter how good the price for fruit may be, if a man has not got much of it he benefits but little by the price. Furthermore, a good crop one year and little or no crop the next bring down the average returns very much and makes the fruit business, especially when one depends on apples alone, a rather precarious one. If I could, at the outset, assure you of good crops every year by following certain methods, I shuld be glad to describe such, but there are conditions, such as the weather, which are beyond our control, and while we may, by the use of fire pots, ward off frost at a critical time, practically no means has yet been devised of preventing rain or making very cool weather warm or of causing rain in time of drought, these being important factors in fruit production. The season previous to the light crop may have an important bearing on that crop. It is not yet fully understood as to what are the climatic conditions most favourable to the development of fruit buds, but it is known that most of the fruit buds are formed in June or July of the year before the crop. If the trees, therefore, are defoliated by caterpillars or apple scab, it should not require any great effort to believe that there could not be the same development of fruit buds as if the leaves of the tree were all healthy and remained on the tree all summer, nor is it hard to believe that even if buds developed sufficiently to form flowers that the buds might not be in a vigorous enough condition to ensure the setting of the fruit. Much more experimental work is still needed in this direction, however. We do not, as much as we should, know how much the development of fruit buds on the temperature or the general character of the weather in the season previous to the light crop. How, for instance, does a summer which is very dry and warm, followed by a warm wet autumn in which new growth starts and some flowers appear, affect the crop for the following year? How does a severe winter affect the flower buds, or very late autumn growth followed by severe frosts?

The reason I have been asked to present this paper is that we have been fairly successful in getting good crops of apples at the Experimental Farm at Ottawa, but before giving you the conditions we have had there during the past nineteen years and their bearing on the crops obtained, I desire to show, if possible, the various ways in which the crop may be reduced, as shown by the work of different experimenters. But before going any deeper into our subject it may be well to give a list of at least some of the things which affect the setting of fruit. They are,—1. The condition of the trees and the weather of the previous year. 2. Temperature and humidity at the blooming season. 3. Pollination. 4. Soil moisture immediately after the blooming season. 5. Fertilizers. 6. Diseases. 7. Insects. 8. Thinning. 9. Summer pruning. 10. Spray injury.

Something has already been said in regard to the season previous to the light crop and the condition of the trees, but the following data in regard to set of fruit from spurs of various kinds will show the importance of having vigorous spurs, and vigorous spurs cannot be obtained without good foliage. These figures are taken from a paper on "The Abscission (or falling off) of Flowers and Partially Developed Fruits of Pyrus Malium, the apple," by A. J. Heiniche, Ithaca, N. Y., read before the Society for Horticultural Science at New York on December 29, 1916.

Baldwin Branch with 251 flower-bearing spurs

Average weight of 139 spurs which did not set fruit, 1.45 gramms.

Average weight of 112 spurs which did set fruit, 2.75 gramms.

Baldwin Branch with 88 spurs

Average weight of 30 spurs which held fruit less than two weeks, 2.94 gramms.

Average weight of 28 spurs which held fruit until the June drop, 3.29 gramms.

Average weight of 30 spurs which held fruit after the June drop, 4.27 gramms.

Baldwin Branch with 677 spurs

Number of spurs making more than 1 centimetre of growth during 1915, 320, of which 67.2 per cent produced fruit.

Number of spurs making less than 1 centimetre of growth during 1915, 357, of which 25.5 per cent produced fruit in 1916.

Baldwin Branch with 443 spurs

Number of spurs with 4 flowers, 50; percentage bearing fruit, 20.00.

Number of spurs with 5 flowers, 137; percentage bearing fruit, 40.9.

Number of spurs with 6 flowers, 266; percentage bearing fruit, 54.9.

Fallawater Branch with 59 spurs

Average weight of all spurs which produced 4 flowers, 1.76 gramms.

Average weight of all spurs which produced 5 flowers, 2.73 gramms.

Average weight of all spurs which produced 6 flowers, 3.36 gramms.

Baldwin Branch with 225 spurs

Average weight of 74 spurs with small conducting tissues (1 to1.4 mm in diameter, 1.50 gr.

Average weight of 112 spurs with medium conducting tissues (1.5 to 1.9 mm), 2.47 gr.

Average weight of 39 spurs with large conducting tissues (2.0 to 2.5 mm), 3.27 gr.

The above figures and others which might be quoted show that the largest fruit spurs set the largest proportion of fruit; that the largest number of flowers in a cluster was on the largest spurs. They also show that the largest conducting tissues or channels through which the sap flows were in the largest spurs, making it evident that the spurs through which there could be the best flow of sap, set the largest number of fruits. Not only is it important to have large spurs with good sap conducting tissue, but it is important to have an abundance of moisture available in the soil when the trees are in bloom and the fruit is setting.

Perhaps one of the commonest causes of short crops in some places is unfavorable weather at the blooming season; low temperatures and rain make very unfavorable conditions for the setting of fruit.

In bulletin 298 of the New York Agricultural Experiment Station, by Prof. U. P. Hedrick on "The Relation of Weather to the Setting of Fruit with Blooming Dates for 866 Varieties," in which the weather records and crops for the years 1881-1905 have been compared, these being based on the County reports of the Horticultural Society of Western New York, Prof. Hedrick states:

"In New York, unfavourable weather is probably the predominating one of the several factors which cause the loss of fruit crops during blooming time."

"Late frosts ruined the fruit crop in Western New York in 1889, 1890, 1895 and 1902. The fruit crops of 1884, 1886, 1891, 1893, and 1903 were seriously damaged by killing frosts. Besides the above years, pears, peaches and plums were more or less injured by frosts in 1892, 1896, and 1900. Fruits were injured at blossoming time by frosts in thirteen years out of twenty-five under consideration."

"Wet weather almost wholly prevented the setting of fruit in New York in the years 1881, 1882, 1883, 1886, 1890, 1892, and 1901. Rain is mentioned as one of the causes of the poor setting of fruit in the years 1888, 1889, 1891, 1893, 1894, 1898, 1905. Of the seasons given above moisture came at blossoming time in the form of snow in 1899 and in 1891. Gales of wind accompanied the rain 1881, 1882, 1883, and 1905. The rainfalls came in periods of prolonged cold weather in the years 1881, 1882, 1883, 1886, 1888, 1889, 1891, 1892, 1894, 1898 and 1905. In 1890 the rainy weather was hot and sultry. Frosts and cold weather accompanied the rains in 1888, 1889, 1890, 1891 and 1892."

"Rain and the cold and wind that usually accompany it at blossoming time cause the loss of more fruit than any other climatal agencies. The damage is done in several ways. The most obvious injury is the washing of the pollen from the anthers. The secretion of the stigmas also is often washed away or because so diluted that the pollen does not germinate. It is probable that the chill of rainy weather decreases the vitality of the pollen and an excess of moisture often causes pollen grains to swell and burst. Rain also prevents bees, and insects from carrying pollen."

Most fruit growers now know how pollination or fertilization of the flowers takes place. Just as the flowers are opening, if conditions are favourable, the anthers containing the dust-like pollen burst open and the pollen is shed either onto the stigma of its own flower or is carried by insects to another flower or flowers where it adheres to their stigmas. The individual grains of pollen are very small and a number of them, under favourable conditions, reach the stigma which, when it is in the best condition, is moist, and holds the pollen grains better than if dry. If conditions remain favourable these tiny pollen grains germinate, or at least some of them do, and the strongest and most active throws out a tube which pushes down through the soft stigma and style until it reaches the ovule and finally the mbryosac, and when its cytoplasm meets that of the female organ fertilization takes place. An apple blossom has five stigmas and pollen tubes may grow down all of them.

Now, if certain conditions are unfavourable, the stigmas of self-sterile varieties may not receive any pollen from other varieties to fertilize them and little or no fruit will set. Again, if certain other conditions are unfavourable, pollen, if it germinates at all, may not have sufficient vigour to develop a pollen tube which will reach the embryo sac, and again, as has been stated above, pollen grains may swell and burst without germinating.

Mr. F. Adams of the Botanical Division at Ottawa found by experiment that there was only slight germination, and the pollen tube only partially developed at a temperature of 40 to 44.3° F. and the most favourable temperature for the germination and development was from 69.8° F. to 73.6° F. Prof. Sandsten of the Wisconsin Experiment Station found the best temperature for the germination of apple pollen to be 75.2° F., his experiments having ranged from 59°

(Continued on page 323)

Prospects for the 1917 Potato Crop

Present conditions indicate a potato shortage next year accompanied by fair prices. Aroostook buyers are reported to be contracting for next season's crops at $2.50 per barrel instead of $1.00, which was the ruling contract price of last year.—"Maine Farmer."

It is exceptionally difficult to form any definite opinion concerning the prospects for the New Brunswick potato crop of 1917, as the total yield depends to a large extent on numerous factors which we cannot, or have not, learned to control. There are, however, certain conditions existing which are likely to influence the acreage planted and the probable yield during the coming season.

Many of these farmers indicate that the average New Brunswick farmer may well consider and conclude that this crop may prove quite remunerative during the coming season.

First let us remember that our potatoes help, even in a small way, to supply the markets of the whole of North America. Therefore, a shortage in the West Indies, or the Southern States, will more or less influence the value of the crop in New Brunswick and the greater this shortage, the greater will be the value of our crop. New Brunswick produces annually about 8,000,000 bushels of potatoes, while Canada produces approximately 75,200,000 bushels, the United States and West Indies, nearly 400,000,000 bushels annually. Therefore, New Brunswick produces about one-tenth of the Canadian potato crop, or less than one-fiftieth of the total production in North America. Hence, an over production in New Brunswick will not materially affect the total production in the area of which we are a part, nor will it greatly reduce the price. On the other hand, anything which reduces the crop over the whole area, will tend to make a general scarcity and consequently higher prices will prevail. Let us realize then, that a large acreage in New Brunswick is not going to produce a glut on the market, accompanied by low prices.

What then are the existing conditions which are liable to influence the potato crop in North America? (1) Price of seed stock. (2) Quality of seed stock. (3) Supply of the necessary fertilizer. (4) Necessary labor. (5) Probable value of the crop. With the exception of the last condition, all tend to show that we may have a scarcity during the coming season.

Price of Seed Stock

The price of seed being one of the initial costs, influences to a large extent, the acreage planted. The average New Brunswick farmer planting six barrels of potatoes valued at $5.00 per barrel, will expend $30.00 on seed alone. Moreover, the Ontario and American farmer will pay $8.00 or more, making the cost of seed approximately $50.00 per acre. This condition will tend greatly to reduce the acreage over a very large area.

Quality of Seed Stock

The quality of the seed stock is one of the most important factors in production and unless good seed is planted, a comparatively poor crop may be expected. This is particularly true in many sections. The unfavorable conditions prevailing during the last two years has probably weakened much of the stock in other sections of Canada and the United States, and owing to the scarcity and high price of good seed, much poor stock will be planted, which is almost sure to result in a low yield unless something is done to supply good seed.

Fertilizer

The scarcity of fertilizer containing a sufficient supply of potash will undoubtedly react to some extent on the crop. Many farmers will plant a smaller acreage on a good quality of fertilizer, while others will endeavor to get along without any, or use reduced quantities. This condition will be most marked in sections where the growers have been depending on commercial fertilizer, and to a smaller extent where barn-yard manure or clover crops have been regularly ploughed under.

Labor

The potato crop requires a good deal of hard labor, particularly in sections where modern machinery is not used, and the scarcity of farm laborers will undoubtedly further reduce the acreage planted and may also reduce the yield per acre, due to poor cultivation. This scarcity will not be felt in sections like New Brunswick and Maine, where the farmers have the necessary potato machinery, but it will be very acute in many large areas like Ontario, where hand-planting, hand-hoeing and digging are quite extensively practiced.

Value of Crop

The above four conditions indicate a small crop, but the possibility of receiving a high price will induce many to plant more extensively. However, indications at present are that this will not offset the scarcity due to other causes.

In view of the fact that these conditions exist in an aggravated form outside New Brunswick, in large potato growing areas, the total crop for North America will be even smaller than during the past season, and farmers who have large quantities for sale will likely reap a just harvest.—G. C. Cunningham.

The N. B. Apple Packing School a Grand Success

Men who know how to pack apples are needed in this province and the demand for such men is bound to increase. This is the reason why the Horticultural Division, of the New Brunswick Department of Agriculture, organized and advertised the Four Days' Apple Packing School, held in Fredericton, February 27th to March 2nd.

The object of this course was to furnish an opportunity for interested parties to learn the proper grading of apples, and the packing of them into both boxes and barrels, by doing the actual work themselves under competent instructors for as many hours as possible during the four days. Demonstration of packing are practically useless, unless the students have practice in the actual work themselves long enough to learn, remember and be able to put into practical use later in their own orchards.

Some fifty students were in attendance and hard at work packing under the direction of the instructors, and they worked hard and determined to take home a good working knowledge of apple grading and packing that will enable them to pack their own fruit to much better advantage.

The instructors were Mr. P. J. Carey, of Toronto, packing expert and demonstrator of the staff of the Federal Fruit Division, and Mr. George H. Vroom, chief fruit inspector for the Maritime Provinces, assisted by Mr. Gorham and officials of the Provincial Horticultural Division.

Mr. George E. Sanders, officer in charge of the Dominion Entomological Laboratory, Annapolis Royal, N. S., gave two lectures on spraying. The first on "Insect and Fungous Enemies of the Apple" and the second on "Sprays and Spraying."

In addition to his entomological training and experience Mr. Sanders is a practical apple grower, and has for some years been conducting spraying experiments for the Dominion Entomological Branch in the Annapolis Valley. No man in the Maritime Provinces is better qualified to speak on this question of spraying. Mr. Sanders' lectures on spraying were very largely attended and closely followed and the best our growers have heard on the subject. Mr. Sanders had on exhibition specimens of injury to the apple by the various insects, also six cases of specimens of the eggs, larvae, pupae and adults of some of the most common orchard insects.

He stayed throughout the entire course, and was eagerly consulted by the individual fruit growers on spraying problems.

From the standpoints of attendance, interest and enthusiasm, the course was easily the most successful of its kind ever held in the province.

On the evening of February 29th, the New Brunswick Fruit Growers' Association entertained the instructors and all those attending the course at a very enjoyable supper and smoker at the York Hotel.

In opening the programme, Mr. R. A. Fillmore, president of the association, dwelt on the necessity for co-operation, pointing out that for success the days of independent and isolated effort have long since passed, and that concerted action is essential to achieve our aims and meet the competition which is ever growing keener.

Address by A. G. Turney.

Mr. A. G. Turney, Provincial Horticulturist, and secretary-treasurer of the association, spoke as follows:

Mr. President, Members of the Association and our Guests:—

I am very glad indeed to have the opportunity of addressing you on this occasion on the subject of fruit growing, a subject for which a common love and interest has brought us together this evening.

First of all I desire to express my deep appreciation of the splendid attendance that we are having at the Apple Packing School and also at the large, earnest and enthusiastic gathering here tonight, in which no fewer than nine counties are represented, namely, York, Sunbury, Queens. Kings, Westmorland, Albert, Charlotte, Carleton, and Gloucester. To my mind both these meetings have a meaning and an importance far deeper than appears on the surface, and I think that in reality they are the evidence, the expression, as it were, of a newer, deeper and more promising interest in the development of fruit growing in New Brunswick, and as such they are very encouraging to myself and the department, as they must also be to you.

The Apple Packing School was not organized and is not being held merely as a thing complete in itself that finishes on March 2nd, but rather is it the first gun to be fired in a new campaign for the better marketing of New Brunswick apples. The second step in that campaign should be the provision this year of additional fruit inspection service. I have been working towards that end and am hopeful that it will be accomplished.

1. Fruit growing in New Brunswick has reached the stage where, although the amount of fruit placed annually on the market is still small, we feel that in the interests of further development the fruit should reach the consumer in a more favorable condition, and at the same time that the growers should secure better returns.

2. These results may be obtained by educating the growers to pack up to the requirements of the Fruit Marks Act, and giving them adequate protection from both local and imported packs and packages falsely marked or marketed.

3. Failure to secure these desired results has already retarded further development of the industry and will continue to do so.

An Inspection Service.

4. This division has not felt itself able to attack these problems of better packing and improved markets with the proper promise of success because its officials have not, of course, any authority or standing in regard to the enforcement of the Fruit Marks Act. Hence our desire for an inspection service under the act—to be applied at the points of production and packing, as well as in the markets.

If we succeed in obtaining that service then it will be possible and profitable for my division to supplement it by putting into the field competent packing instructors, who although having no authority under the Fruit Marks Act, would still be able to materially assist the work of the inspectors. The improvement in the packing of our apples which these steps would undoubtedly bring about would then make it possible for us to ship to other Canadian markets if so desired. But first of all we must have the improvement in packing. The very worst thing that could possibly happen to the industry would be to have our initial shipments to outside markets reach them in poor condition and poorly packed. It might be years before we could overcome the poor first impression thus created. When we begin to ship to outside markets we must send only such fruit and that so packed as will create a favorable impression, establish a reputation for quality, and a demand for more.

To Improve Prices.

As evidence of what can be done in certain years to improve prices on the local markets and at the same time procure good returns let me quote the details of sale for one car of apples shipped to Montreal last December by Mr. Gilman.

1916. Car 280710.
22.12.
35 No. 1 Alexander; 20 at $3.75 and 15 at $4.00..$135.00
36 No. 2 Alexander; 16 at $3.40 and 20 at $3.50.. 124.40
44 No. 3 Alexander at $3.15 ..... 138.60
5 No. 1 Wealthy at $4.00 20.00

10 No. 2 Wealthy at $3.40	34.00	
52 No. 3 Wealthy at $2.75	143.00	
3 No. 1 W. River at $3.75	11.25	
5 No. 2 W. River at $3.30	16.50	
5 No. 3 W. River at $3.00	15.00	
4 No. 1, McMahon's White at $3.75	15.00	
1 No. 2 McMahon's White	3.25	
		$656.60
Charges	100.70	
Cartage	14.00	
Other expenses	65.60	
		180.30
Net proceeds		$475.70

The car in which this shipment was made was a very large one and could have held another 100 barrels, reducing the freight cost from 50c to 35c per barrel. Also, the consignees advised that had the shipment been made a month earlier still better prices would have been secured. Mr. Hatheway also made an l.c.l. shipment to Montreal with satisfactory results and perhaps he will refer to it later on. This subject of marketing is a very large and important one, but I will say no more about it as we have with us this evening gentlemen who have had a great deal more experience than I have in that phase of the business and I hope that we shall hear from them before the evening is over.

Horticultural Division.

Now gentlemen, I wish to say a few words about the Horticultural Division and the Department of Agriculture, and then as to the work and objects of the Horticultural Division and yourselves, and the relation between us. It is common knowledge that, prior to 1910, the Government had given little or no attention to fruit growing. In February of that year, largely as a result of the efforts and recommendations of Mr. Hubbard, I was appointed as Horticulturist. Comparatively speaking, the Horticultural Division grew rapidly. I was alone in the work for the first fifteen months, and then was fortunate enough in June, 1911, to secure Mr. Gorham as a temporary assistant, and he was appointed to the permanent staff in 1912. Then Mr. Flewelling came to me as a temporary assistant in the fall of 1912, and received his permanent appointment in June, 1913. Each year up to the present time I have had temporary assistants for some weeks in the spring and fall. Unfortunately, however, we lost the services last March of Mr. Gorham, he going, first, to the staff of the Provincial Normal School and, later, to the Experimental Station to assist Mr. Hubbard. I had already lost the services of Mr. Flewelling, although I hope he will eventually come back to us, as he went overseas in November, 1915. So you see that today, largely as a result of war conditions, but not altogether so, the division has lost its two permanent assistants, and is reduced to its original strength. I feel very strongly that your interests and the interests of the work require that the maximum strength of the division should be re-established as quickly as possible, and I believe that the Secretary and Minister of Agriculture will be in sympathy with that feeling. But the points that I wish to make clear to you in this connection are these: That although during the past six years the funds available for expenditure on aids to farming have trebled, there has been a still greater corresponding increase in the number of branches or phases of farming to which the Government is giving aid and paying attention. In March, 1910, the department consisted of the Commissioner, the Secretary, Mr. Hubbard, two Dairy Superintendents, and myself; and, shortly afterwards, Mr. Jones was appointed as Poultry Superintendent. Since then many appointments have been made. Mr. Newton, as Director of Agricultural Schools and Chief of the Soils and Crops Division, and Mr. B. T. Reid as his assistant. Both of these gentlemen are now at the front. Mr. Durost, the Instructor of Soil Fertility and Beekeeping. The late Mr. Ford, who made the supreme sacrifice in Flanders last June, as Provincial Animal Husbandman. Mr. R. P. Steeves, as Director of Elementary Education, and Mr. Robinson as his assistant. Mr. Morton as an assistant to Mr. Daggett; Mr. N. W. Eveleigh, as assistant Dairy Superintendent, and lately, Prof. J. W. Mitchell, as Chief of the Livestock and Dairy Division. In addition to these appointments to the permanent staff two Agricultural Schools have been built and equipped, temporary assistants have been employed and attention has been given to the encouragement of farm drainage, extension of field crop competitions and seed fairs production of clover seed, and the provision of lime for agricultural purposes.

Object of Fruit Growers.

And so, while I believe that the requests for funds are considered on their merits, it is obvious that there is more competition in securing the appropriations for different branches of agriculture. Therefore, you should not forget that those farmers, who, representing a certain line of farming, show in the most acceptable and convincing manner possible there appreciation of the aid already given by the department and their eagerness for a continuance and extension of that aid, are more likely to secure the necessary funds to assure it.

Now a few words as to the function and objects of the fruit growers and the horticultural division. We have been carrying on a campaign for the improvement and extension of orcharding in New Brunswick. What are the units that we have to work with to bring that campaign to a successful issue. Well, first of all, there are what we might call the natural conditions—suitable soil and climate and a favorable position with respect to transportation facilities. I need say no more about these factors. The fruit growers themselves constitute the second unit, and the horticultural division may be considered as the third and last unit. If you will permit me to liken the last two units to a wheel, then the horticultural division may properly be considered as the hub, and the fruit growers as the spokes of that wheel. It is the business of the hub to units the growers into one solid structure and consolidate their action towards the securing of a given aim; the function of the spokes, as represented by the fruit growers, is to strengthen and enlarge themselves or their orchards and so extend the circumference or rim of the wheel, or in other words to extend the industry itself.

Modern Methods.

Each New Brunswick orchard owner here this evening is a member of the Horticultural Division, and, further than that, he is one of the practical demonstrators of the possibilities of profitable apple production in this province upon whom the enlargement and improvement of the industry directly depends. If this course and this meeting lead you to give your orchards better attention and apply to them modern and improved methods of orchard culture, then we will have created just that many more centres for the diffusion of such knowledge.

You gentlemen here tonight constitute by far the greatest and most important of the three factors that we have to work with. I want to say to you that the advancement to be made is up to the fruit growers and not to the Government. The division has been created and is here for the purpose of co-operating with you and assisting you in the carrying out of your work and the advancement of your interests. It cannot be gainsaid that the progressive orchardists and the profitable orchards are the strongest factors and the biggest assets that this province has today in its campaign for more and better orcharding; they are the biggest advertisement of the suitability of our climate and soil and the most convincing argument for others to follow the example and so extend the industry. Let us have more progressive orchardists and more profitable orchards.

I feel that I should say a few words about our neglected apple orchards. They occupy the rather unique position of being at the same time an obstacle to progress, and an evidence of favorable natural conditions. We all know what they are, but we might well stop for a moment and consider the question why they are. As I am speaking this evening to a gathering of practical growers it will not be necessary for me to more than touch upon some of the reasons, but there are one or two that I wish to emphasize as being the main factors for us to consider. A first reason is: The wrong selection of varieties, soils, and sites. Years ago many thousands of trees of the Duchess, or New Brunswick variety, were planted out in this province. That variety, as you know, is a perishable one, having a very short season, and it is also very hardy, thrifty, and an abundant producer. The result was that many of these trees came into bearing with absolutely no provision made for the disposal of the product. Consequently the local markets were gutted, prices reduced to a point where in many cases it did not pay to harvest the fruit, and hence the orchard fell into neglect. Since that time there has been considerable improvement in the choice of varieties, and there is now less tendency to plant early or unsuitable kinds.

Much Remains to be Done

Nevertheless much remains to be done, and we ought to foster the adoption of what we call "community planting," that is, the planting of a very limited and selected number of varieties of proven adaptability and merit in a given area. The wrong selection of soils and sites while perhaps, partly responsible for neglected orchards, is probably more responsible for failure to successfully establish orchards. A second reason is the increasing prevalence of insect and fungous pests. It is now well established that no man can be a successful apple grower without spraying. Although making a little headway we are behind in this part of the business. Education and the example of successful orchardists are producing results. Much of the spraying that is done isn't done thoroughly and we don't spray often enough. But every year orchard owners are being confronted with the necessity of spraying or losing their orchards, and the sooner the unsprayed orchard goes out of existence the better for the industry and those in it. A third reason: Poor market—a condition to which I have already referred. A fourth and very important reason is the unsuitability or suitability of the man. Many an average general farmer is temperamentally unsuited by environment and experience to work with fruit crops. The view points of the fruit grower and the general farmer towards crop production are essentially different.

Success in Fruit Growing

To be successful in fruit growing one must come into closer contact with the crop than is necessary to be successful in general farming. Orchardists have a more intimate knowledge of the individual fruit tree than the farmer has of the individual plant of grain or root crops. Many men become enthused with the idea of owning an apple orchard and the profits to be obtained therefrom, but after planting the trees they rapidly find that the price for success is more industry, more intelligence, greater attention to detail and greater patience than the growing of ordinary crops. Such men are temperamentally unsuited for the work—they gradually drop out of the game and their orchards fall into neglect. A fifth and perhaps the most important reason of all is the size of the orchard. If any of you were to go through the province this coming summer I feel sure that you would find, with few exceptions, that the smaller the orchard the more neglected it is, and the larger the orchard the better attention it is receiving. In other words the amount at stake has a definite relation to the attention given, and it would seem that small plantings favor the neglect of the farmer's orchard. A large number of the small orchards in this province were planted with the object of providing sufficient fruit for home use and marketing the surplus. The result has been that the orchard produces more than is needed for home consumption and not enough to induce the owner to give it proper attention and market the product correctly. The orchard is not big enough to utilize efficiently even a small equipment. In other words the portion of the farm devoted to the orchard is not, in the mind of the farmer large enough to justify any greater share of labor than is required by the same acreage planted to an average farm crop. The inevitable result is a neglected orchard. You have been doing and can continue to do something towards remedying that state of affairs. Your success awakens the curiosity of your neighbors and gradually creates in them a realization of the possibility of their orchards and a desire to give them better attention. This means that in favorable years you may be able to handle a part of their surplus crop and thus stimulate their interest and lead them to plant out more trees, and give them better care.

Small Orchards

The future of successful apple orcharding in this province lies in the small commercial orchard on the general farm, and I say that the men, who is by temperament suited for the work, may safely and very profitably engage in apple growing one a reasonably large scale on the general farm in New Brunswick. His objects should be to establish anywhere from three to ten acres of orchard, but he should go slow at first, setting out perhaps one acre the first year, and adding to his orchard as his knowledge increases and his ability to make a success of it is proved.

I venture to state that there is no potential producing unit on the average farm of New Brunswick that is so neglected and left so utterly to its own unassisted efforts as the old apple tree, and I also venture the statement that there is no other unit, given the proper care and attention, that is so profitable as that old apple tree. A farmer will neglect the apple orchard in favor of almost every other job on or off the farm, even when the dollars and cents returns from that other job are as nothing compared with the returns to be secured by putting the same amount of labor on the orchard at that particular time. By all means let us give the apple orchard a better chance.

The N. B. F. G. A.

A word as to the New Brunswick Fruit Growers' Association. This organization, while yet in its infancy and deficient in many respects, is nevertheless doing good work for the advancement of your interests. It compares more than favorably with the other farmers' organizations in the province. For the past four years we

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

June 12-26

READY SALE FOR OFFSPRING OF RECORD PRODUCERS

Professor J. W. Mitchell intimated at the annual meeting of The New Brunswick Farmers and Dairymen's Association recently held in Fredericton that he would favor the introduction of a sliding scale of bonuses to agricultural societies in the purchase of purebred dairy sires. The scale will be governed by the production records of the dam and the ancestry of the sire of the animal purchased. For instance if the dam has a record of 15,000 lbs., the total bonus paid will be much more than the bonus paid if the dam's record is only 10,000 lbs. Again the bonus will be greater for the offspring of a 10,000 lb. cow than the bonus on the offspring of an 8,000 lb. cow.

The increased bonus will be one big factor in inducing agricultural societies to purchase bulls from high record dams and record making ancestry. The effect will be far reaching. The Maritime Farmer would suggest that no bonuses be paid on purebred scrubs by which we mean purebreds from non-profit producing ancestry.

We learn from a number of breeders who advertise in The Maritime Farmer that buyers are getting more exacting all the time in regard to breeding and individuality. This is surely a sign of the times and the breeders who neglects to keep records of the production of his cows will find it an increasingly difficult matter to dispose of their surplus stock.

The breeder who has stock from record producers for sale and who advertises judiciously will not experience any difficulty in making good sales.

On another page of this issue the reader will find extracts from a letter recently received from S. Dickie & Son, Central Onslow, N. S., who persistently and consistently keep records of the production of the individuals in their herd and advertise judiciously in the columns of The Maritime Farmer. It contains food for thought for breeders who are slackers in the advertising line.

The value of milk records is very clearly shown in a recent auction sale of farm stock in England. The milk record certificates issued by the board of agriculture were referred to by the auctioneer and handed by him at the sale to the purchasers. The cows are reported to have made $10 to $20 per head more than they would have done had they been sold without certificates, and the seller was satisfied that the possession of the certificates for the cows resulted directly in a net increase in the total prices obtained of approximately $1000.

STUDY THE SEED CATALOGUES

There is every indication that seeds will be scarce and high. Have you secured your supply? If not, do you know where you are going to get it? If you cannot secure your supply near home it is not a moment too soon for you to place your order with some reputable seed house. You will find the advertisement of several reliable seed houses in the columns of the Maritime Farmer. The seed catalogues they issue each year are works of art, but you should admire them for the possibilities they offer for studying over and choosing suitable seeds for the farm and garden. Look to the seedsmen to tell about the virtues of their seeds, and then choose those best adapted to our conditions of soil and climate.

We do not believe that many people can go into a store, look along the colored boxes of seeds on the counter and select hastily their seed as advantageously as they can by going quietly about it at home during the winter evenings with the catalogs before them. One must study the little points and weigh the advantages and disadvantages of each type or variety if he would secure the best results at harvest time. One cannot decide this point in a few minutes.

But you can use the same kinds of seeds you've always used! Of course that is true, but perhaps some other variety may be better adapted to the conditions, there may be some other kind of seed it would be well to try on a small scale. Good, new seed of strong vitality is wanted. The reliable seedsmen are specialists in their line, just as are doctors and lawyers, and the information they give is often quite valuable in many ways. While good seeds are absolutely necessary for the production of maximum crops it is also necessary that they be chosen with a view to adaptability, and be on hand when needed. Therefore, get the catalogs ready, study them leisurely and intelligently, and buy the seed early while they are still plentiful.

PENALTY FOR NEGLECTING AGRICULTURE

The March 3rd issue of the New England Homestead says:—

"England is now paying the penalty for neglecting her basic industry for three-quarters of a century past. She finds it necessary to prohibit exports of many foods and luxuries, to guarantee higher wages to farm labor and high prices to farmers for their crops for several years to come. The purpose of the new programme is two fold:—

1. To encourage the home production of food which she must have or starve.

2. To make up the loss of shipping, due to warfare and the shortage in her ships' capacity to handle men and munitions for war purposes.

It is the most striking illustration in human interest of the supreme folly for any nation to neglect its agriculture. For wheat the government is to guarantee the British farmer $1.80 a bushel for this year, tapering off to $1.35 at the end of five years; oats $1.15 down to 72 cents; and potatoes for this year 77 cents. English farm laborers are to receive a wage of 25 shillings a week, against present wage of 14 to 18 shillings, or in some instances nearly double."

The foregoing figures and conditions of affairs should surely be an incentive for the farmers of Canada to put forth every effort to do their utmost for the production of bumper crops this year.

* * *

Manure stored in the open barn yard loses a considerable portion of its nitrogen through fermentation, and its potassium and other elements through leaching. The loss may be avoided by hauling the manure to the field as soon as it accumulates. It pays to conserve the fertilizing elements produced on the farm at all times, but more so when the commercial fertilizers are so expensive and hard to get.

* * *

The DeLaval Monthly, official organ of the DeLaval Separator and Dairy Supply Co., says:—

The dealer who keeps himself posted and up-to-date on modern dairy methods will get a great deal closer to his farmer customers, and they will have more confidence in his advice, not only in the selection of dairy machinery, but of other farm implements and supplies.

A good way to keep in touch with agricultural progress is to subscribe to a good farm paper. Many of the state and national farm papers devote a good deal of space to dairying, and it will pay every farm implement agent to become a subscriber to one or more of these papers.

* * *

Does it pay to keep sheep? Read the experience of W. M. Lea, one of the foremost dairymen of the Island Province in a recent issue of the Maritime Farmer. Mr. Lea has one of the finest Holstein herds in the Maritime Provinces. His records at the creamery where he disposes of his cream shows a high producing average per cow. He is a close observer of the signs of the times and as such has again established a flock of sheep on his farm. He has evidently solved the fence problem and luckily is not pestered with the dog nuisance.

* * *

A Maine State Agriculturist stated recently that "the farmers of Aroostook County had learned to plant better seed and that they would not accept as a gift now seed that they used to use for planting." It will be a great boon for the Maritime Provinces when the rank and file of our farmers think and act along similar lines.

* * *

The fertilizing value of the total excrement from horses is about $20.00 per animal per year, and from cattle about $25.00, according to the chemical department of the Nebraska Agricultural Station. Do not lose much of this value by being careless about the manure pile.

* * *

The wise man is he who places his orders for seeds and other requisites for the planting season as early as possible, so as to allow for delays in transit, and thus avoid the waste of golden moments when the season for field work arrives.

* * *

One of the good things that the year 1917 holds in store for New Brunswick is the replacing of the Scot Act by Prohibition. There is a movement on foot for Dominion wide prohibition and we believe it is sure to come.

OFF CROPS AND THEIR CAUSES

(Continued from page 319)

F. to 96.7° F. Prof. Kraus of the Agricultural Experiment Station, Corvallis, Oregon, states that 65° to 83° F. may be considered as suitable for the majority of tree fruit pollen. It will thus be seen that should the temperature run pretty regularly below 70° F. during the blooming season fertilization is not likely to be good. Prof. Hedrick in New York State Bulletin 407, published in May 1915, on "The Blooming Season of Hardy Fruits" states that during the season of 1915 "Mr. W. F. Friedman, a student assistant at this Station has found that pollen grains of practically all fruits burst and will not germinate in water," showing what effect excessive moisture grains might have in preventing germination of pollen. It is further stated in the same bulletin "From this work, extending through the whole blooming season of 1915, there could be little doubt but that the action of rain on pollen is quite a potent factor in preventing a set of fruit as its injurious effect on the stigmatic juices." Sandsten found that pollen burst, when in masses, during warm rains. Adams found pollen germinatic in the anthers before being shed. This might occur during a fairly warm moist period. It will be seen from the foregoing that not only is moderately warm weather necessary during the blooming period, but that bright sunny weather is desirable also, and a long spell of cool wet weather beginning when the flowers are opening is very unfavourable to pollination. In addition to the cool wet weather, unfavourable to the germination of pollen and unfavourable to fertilization, there may be frost. Apple blossoms in bud will stand more frost than when they are fully open. When the petals fall less frost will cause injury than when the trees are in full bloom. From five to seven degrees Fahrenheit of frost are likely to cause severe injury to apples when in full bloom, and after the bloom has fallen, from four to five degrees may do much harm. Much depends on the length of time the flowers are frozen and on the weather following the freeze. If the flowers have been injured by frost, an examination after the petals are open, if the frost occurs when they are in bud, will reveal the centre of the flower or pistil discoloured or brownish. The fruit will not set when flowers are injured in this way. The frost may, however, come after fertilization has taken place when the fruit may set.

Experiments have been made with orchard heaters at the Experimental Farm at Ottawa for several seasons and while, as yet, no results have been obtained which show an increased crop from the use of the heaters, as the weather has not been cold enough at the blooming season when the heaters have been in use to demonstrate their value, yet it has been shown that the temperature can be raised considerably. On the night of May 20, 1915, sixty-three Competition heaters were used in an apple orchard over an area of 32,564 square feet, or at the rate of 80 per acre. At 1 a. m. an alarm came in that the temperature had reached 34° F. and by 1.30, when the heaters were lighted, it had fallen to 32° F. The ground temperature that night fell as low as 31° outside the orchard, while the ground temperature inside the orchard was never below 34° after the heaters were lighted. At three feet from the ground the temperature outside was 32°, while inside it never fell below 36° after lighting the heaters. On May 27 the heaters were lighted at midnight when the ground temperature was 32°, and 34° was registered three feet above the ground. By two o'clock the temperature outside stood at 28° on the ground and 32° three feet from the ground, while inside the orchard the ground temperature was 33° and the temperature three feet above the ground was 37°. On this night the heaters were used at the rate of only 60 per acre. This demonstrated that in an orchard of one acre, sixty heaters of the Competition type are capable, under certain conditions, of raising the temperature of the air surrounding the trees, 9 degrees. From our experience with six different types of heaters the following kind of a heater is recommended.

1. One with a large capacity, or not less than four gallons.

2. One with a good draft control. Proper control of draft is very important, for it allows the operator to increase or decrease the fuel consumption, as he desires, thus increasing or decreasing the amount of heat given off per hour.

3. Round heaters are preferable to square or longitudinal ones, as they do not warp so readily.

Cross-pollination.—It might be thought that enough had been said about pollination but there is still another important phase of it to consider. Experiments have shown at Ottawa that a large proportion of varieties of apples are self-sterile or practically so, and need pollen of another variety to ensure a setting of fruit. In 1915, for instance, of twenty-nine varieties tested, only five varieties set any fruit at all and only one was decidedly self-fertile, whereas when thirteen of the same varieties were cross-pollinated, only two failed to set fruit. Most of the pollination of apple blossoms is done by insects, hence it will be readily seen that if the weather is unfavorable for insects to work, fertilization is not likely to be good. Some varieties of apples, though self-sterile in one place, do not appear to be so in another, and this is being studied in order to learn the cause. In the case of some kinds and varieties of nuts, the pollen and the pistil are not mature at the same time, and one may be too far gone to effect fertilization before the other is ready. It is probable that further studies in pollination will show that this happens with varieties of apples and that certain climatic conditions will cause either the pollen or pistil to mature first, while, under other conditions, they may mature at the same time or one may remain in good condition long enough for the other to catch up. In studies of the pollination of pecans in Georgia, Prof. Stuckey informed me recently that one cause of self-sterility in pecan varieties was that the pistillate flowers were mature before the pollen bearing or staminate; with other fruits, and other varieties it might be reversed. From observations at Ottawa we believe that the stamens which bear the pollen mature quicker in high temperatures than the pistil, hence pollen of a variety might be shed before the stigma was ready. The pollen and pistils of some varieties may mature at different temperatures to others. These are things that have yet to be worked out. The fact, however, that cross-pollination among varieties is desirable has been well demonstrated, hence the importance of having favourable conditions for this to take place. Apple blossoms do not all come out at the same day and sometimes, if the weather is cool, the blooming season of one variety will continue for between two and three weeks or perhaps longer, but in a warm dry season it may only last five or six days. To be sure of the best conditions for cross-pollination it is desirable to have varieties beginning to bloom at the same time in the same orchard, and preferably have the rows alternating or say two rows of one variety to four of another, so that in case there is only a limited time when conditions are favourable for insects to work they will lose the least amount of time in pollinating. In some seasons when the weather is unfavourable for pollination there will no doubt be an advantage in having a variety that begins to bloom a little later than another as the pollen from it might catch the later blooms of the early variety at a time favourable to pollination when the main blooming season of two varieties blooming at the same time might be unfavourable. All these things are well worth considering in planting orchards.

Comparatively little is known yet as to the cause of the June drop of apples, which in some years is very heavy. This may be due to only partial fertilization, the pollen tube having germinated but failed to fertilize the ovary. It may be due to unfavourable weather or soil conditions which check the growth of the tree, causing a certain proportion of the fruit to drop. This checking of the growth might be due to water soaked cold soil or it might be due to very dry soil or it might be due to very cool weather. It has been stated that aphids cause enough irritation about the pistil to cause the apple to swell a little but not being properly fertilized it drops off later. But there is much to be learned about this June drop yet.

Soil Moisture at Blooming Time.—The importance of a good supply of moisture of soil when the fruit is setting was noticed at Ottawa in 1911, when there was a very hot dry time from the blooming season until well on into the summer and a relatively small crop set. It is important to plough a cover crop under early and start cultivation early in order to conserve moisture at that critical season of the year, in case there should be a dry time, as the loss of moisture from ground not cultivated and especially when there is a growing cover crop may be very rapid.

Fertilizers.—Little will be said in regard to the value of fertilizers in obtaining good crops as the results from the use of fertilizers might be quite marked in one orchard while in another where the soil was somewhat different it might be difficult to find any marked advantage in their use, but when it is known what kind of plant food the soil really needs the results may be quite striking. Such results were recently presented by Prof. Lewis of the Oregon Experiment Station at a meeting of the Society for Horticultural Science in New York on December 28, when he showed that by the application of 6.7 lbs. of nitrate of soda per apple tree a month before the trees bloomed, in soil lacking in humus and nitrogen, there was 160% more fruit set than on trees which received none. Just how the nitrate of soda caused the fruit to set is not clear. It dissolves rapidly and the trees would, no doubt, be taking up the nitrogen by the time the fruit was setting, when, perhaps, the extra vigour of growth caused by the nitrogen would cause a quicker flow of sap which would better ensure the young fruit getting an adequate supply.

Injurious Insects and Disease.—I shall refrain from saying much about the loss of crop by fruit not setting due to the Green Apple Bug, and Apple Scab and other insects and fungous diseases. The loss is, doubtless, very heavy particularly in some seasons.

Spray Injury.—Drenching of the trees with very strong or improperly made spray mixtures may cause such injury that the fruit will not set well. It is desirable to use the materials and formulas which have been well tested, and found satisfactory.

Results at Ottawa.—At the Experimental Farm at Ottawa records have been kept of the yields in gallons of each individual tree in the orchards since 1898, or for 19 consecutive seasons. The time when each tree began to bloom, was in full bloom, and when the bloom fell, has been recorded every year since 1899. The amount of bloom whether small, medium or large has been recorded every year since 1899. The temperature records have been kept since that time and also the daily sunshine records and rainfall so that we have an abundance of data on which to base the cause of the large proportion of good crops which have been obtained. The trees have been thoroughly sprayed every year since that time and they have never suffered to any great extent from either injurious insects or diseases until 1916, when in the early part of the season the scab on the foliage was very bad and what is quite unusual with us, there was some scab on the fruit of some varieties as well. In the 18 seasons from 1899 to 1916, inclusive, there has been a relatively light crop of some varieties every alternate year, there being one exception in the year 1905; thus certain varieties bore light crops in the years 1899, 1901, 1903, 1907, 1909, 1911, 1913, and 1915 while medium to good crops were produced in the other years. This would seem to prove that most varieties are alternate bearers, but on consulting our weather records, there appears to be good reason for the light crops in most of the years. Thus in 1899 the maximum temperatures ranged between 58 degrees and 61 degrees when the flowers were opening and it rained on four consecutive days. In 1901 the maximum temperatures were below 60 and it remained at that on four consecutive days during the blooming period. In 1903 the weather was excessively hot during the blooming time, the temperatures ranging from 82 to 91 on six consecutive days and the ground was very dry. The exception to regularly alternate off year came in 1905 when there was a good crop generally but we found that the maximum temperatures ranged between 70 degrees and 80 degrees most of the time, being quite favourable for pollination. The year 1907, the bloom was very late and the maximum temperatures ranged from 57 degrees to 67 degrees in the first and second weeks of June when the trees were in bloom and beginning in May and ending June 10 there were sixteen consecutive days when it either rained or was cloudy. In 1909 while the maximum temperatures were above seventy most of the blooming season, and the weather clear, the blooming season was late and weather was unfavourable for growth in June which may have prevented the fruit from developing. In 1911 it was very hot and dry in the blooming season, maximum records on successive days beginning May 18 being 86, 82, 92, 94, 94, and 87 degrees. This exceedingly hot dry weather is not, we believe, favourable to good pollination. It was an early blooming season in 1913 but when the flowers began to open the temperature fell and between May 8 and May 22, when most of the bloom was, there were nine days when it was below sixty and frost was recorded on four nights.

In 1915 the maximum temperatures ranged from 49 to 67, on four days it was below 60; once it went up to 77 during the blooming period. Frost was recorded on one night. This was an unfavorable season for the setting of fruit in many places in Ontario.

The years 1900, 1902, 1904, 1905, 1906, 1908, 1910, 1012, 1914, and 1916 were all favourable for the setting of fruit, the temperature being sufficiently high but not exceptionally high and the weather being clear most of the time.

It will be seen that the alternate

bearing which at first glance might be thought was due entirely to heredity or constitution is really a coincidence and that it is caused mainly by the approximate alternate favourable and unfavourable weather conditions at blooming time. It is true that the bloom has not been so heavy in these off years but there is usually some blooms and in a season favourable for pollination good crops have been obtained when the bloom was relatively light.

As bearing out our records in regard to the influence of the season on the size of the crop, let me quote the summary of observations made at the Woburn Fruit Experiment Station in England:

"The view that fruit trees tend to bear heavily and lightly in alternate seasons is often made the basis of a recommendation to thing a heavy crop borne one year, in order to obtain a better crop the succeeding year. It appears, however, that the tendency towards alternate cropping, as it may be called, is very feeble, and that there is, at the same time, an equally potent tendency towards consecutive cropping, that is, that a tree bearing particularly well or badly during one season will probably do so the same in the succeeding season, whilst the chief factor in determining good or poor bearing is undoubtedly the atmospheric conditions and not any innate tendency of the individual tree to either alternate or consecutive fruiting.

"In another case of apple trees where observations apply to over 5700 instances extending from 1904 to 1915 the tendency has been, with only one slight exception, towards consecutive bearing. But this tendency affects the results to only a slight extent, about 12 per cent, the remaining 88 per cent being attributed to peculiarities of the season, and not to the individual behaviour of the trees." Further—"The alternation of good and bad years has been uniformly exhibited to a most marked extent in some plantations available for observation over a period of 20 years. As the injury to these crops has nearly always been due to spring frosts, it is evident that the alternation of good and bad years is due to the tendency of such frosts to occur alternatively in consecutive seasons."

Cause of Good Crops at Ottawa:

Someone may now wonder, if there has been an unfavourable spring every other year at Ottawa, why good crops have been obtained much more

Ewing's Grass and Clover Seed

No. 1 Government Standard

has earned a high reputation for sure germination, sturdy growth and heavy crops.

We buy the seed from the districts which we have found produce the cleanest and best strains. Then we clean and re-clean it until it comes well within the Government Standard in freedom from those noxious weeds that are so easy to introduce to your fields, and so hard to eradicate.

Some of our famous Brands:

Ewing's "Canary" Brand Early Red Clover.
Ewing's "Eagle" Brand Late Mammoth Red Clover.
Ewing's "Best" Brand Alsike Clover.
Ewing's "Sun" Brand Timothy.
Ewing's "Moon" Brand Timothy.

All No. 1 Government Standard.

If your dealer does not handle Ewing's Seeds, write for prices and catalogue to 49
THE WILLIAM EWING CO. LIMITED, *Seed Merchants*, McGill Street, MONTREAL.

in 1888 beginning in 1902—69½, 43, 72, 96, 75, 52, 81, 78, 97, 94, 50, 74, 143, 109, 136, an average of 85 gallons or 3½ barrels per year for 15 consecutive years. Charlamoff planted in 1888 beginning in 1902—66, 6, 106½, 33, 81, 33, 103, 38, 97½, 15, 108½, 25, 133, 22½, 123½, an average of 66 gallons or 2¾ barrels per year for 15 consecutive years, the lighter crops being in the unfavourable seasons.

Antinovka, one of the hardiest Russian apples and one that is most extensively grown in the colder parts of Russia, has made a wonderful record. Planted in 1888, the yields from 1902 are 57, 7, 88, 68, 105, 84½, 84, 77, 112, 65, 113,—It had a large crop the next year, 1913, but the yield was not recorded), 152, 116½, 93, an average for the fourteen years of 87 gallons or 3⅝ barrels per year.

McIntosh—Planted 1890, the yields from 1902 are 71½, 94, 12, 109, 3, 109, 41½, 184, 50, 166, 55, 145, 112, 44, 149½ an average of 90 gallons or 3¾ barrels per year.

Wealthy—Planted 1888, the yields from 1902 are—21½, 35½, 60, 60, 65½, 33, 69½, 12½, 62½, 15½, 93½, 12, 114, 24, 124, an average of 54 gallons or 2¼ barrels per year.

All the trees of the above mentioned varieties did not yield as good crops as regularly as those given above but these and others are the varieties which assured us good crops in bad seasons.

There are undoubtedly some varieties of apples which bear in alternate years and which have no flowers in the off year. Tetofsky is one of these, there being an off year regularly, alternately from 1899 to 1916 except in one off year when there was a slight amount of bloom. The Tetofsky goes very much to spurs and bears very heavily in alternate years.

Recommendations

From the foregoing data and other information, we make the following recommendations for obtaining the maximum number of good crops:

For the men who intends planting an orchard, we advise planting on a slope where there will be a good circulation of air avoiding pockets and flat land where frost will settle. In blooming time the temperature on the slope may be 9 to 10 degrees higher than that on the level and even regularly from some varieties. We believe it to be due to the fact that a large proportion of the varieties now growing at Ottawa are very hardy, and the flowers are able to withstand adverse climatic conditions better than the more tender sorts. Take the following yields in gallons for instance of individual trees, which if divided by 24, will give about the number of barrels each year. Duchess of Oldenburg planted in 1888. Following are the yields from a certain tree for the years 1902-16 consecutively in gallons—63½, 47, 89, 70, 111½, 68, 100, 52½, 111¾, 93, 149, 49, 132, 69, 132½ an average of 89 gallons

Maritime Farmer Office

or 3¾ barrels per year for 15 consecutive years. McMahon White planted if there is no frost the temperature on the level may not be high enough to ensure a good germination of pollen and fertilization. Plant at least some of the hardiest varieties of apples so that these may be depended upon in unfavorable seasons to give a medium to good crop.

Plant varieties, which have the same blooming season, alternately, say two rows of one and four of another.

Keep bees to aid in pollination so that the greatest advantage may be obtained from a short favourable period in a generally unfavourable blooming season.

When trees are old enough to begin to crowd, prune severely to admit sunlight and air or take out some trees altogether.

Spray thoroughly every year to reduce to a minimum the loss from injurious insects and fungous diseases and ensure good foliage and a good development of fruit buds.

Begin to cultivate as early in the spring as possible to conserve moisture where there is any danger of too little moisture in a dry time.

Keep up the fertility of the soil. Trees with insufficient available plant food will not set as much fruit as those with a regular and good supply.

THE N. B. APPLE PACKING SCHOOL A GRAND SUCCESS

(Continued from page 321)

have averaged a membership of 100, although the field from which we have to draw is very limited. The Farmers and Dairymen's Association, now in its 42nd year, had some 160 of 170 members in 1916, notwithstanding the fact that they had a very much larger field to draw upon. So I think that the Fruit Growers' Association is doing good work and is worthy of your utmost support. It is your organization and you should try and strengthen it by working for it and securing new members.

A Loss to the Province.

I wish to take this opportunity of expressing my deep personal regret, and the regret of the department, which, I am sure, is also felt by the fruit growers of the province, at the loss of Mr. Gorham's services. He was at all times an exceedingly hard and effective worker in your interests, and I doubt very much if his equal can be secured to fill the position he vacated. I am glad to say, however, that his services are still available to the province and I know that our loss is Mr. Hubbard's gain. I could not close my remarks without referring to Mr. Flewelling and Mr. Holman, who both went overseas and are doing their bit so well. Mr. Flewelling, who went with the 4th University Company, of Montreal, reinforcing the Princess Patricia's Light Infantry, was quite seriously wounded on the Somme front on September 15, 1916, being shot through the left breast very close to the heart. He was in the hospital and convalescent homes for some months, but it now sufficiently recovered to be on military duty in a depot in England. Mr. Holman, who assisted us in the work in 1914, went overseas with the 6th Canadian Mounted Rifles, and has been at the front with a signalling corps for the last eighteen months. I trust that both of these gentlemen will return safe and sound in the near future to renew their connection with the work.

It is a pleasure to express my appreciation of the work that you have done and are doing for fruit growing in New Brunswick. In attempting to carry out the work of my office I know that I have made mistakes, perhaps many of them, but you have always been very considerate, and I feel personally indebted to you for the very generous measure of sympathy and co-operation which you have given me.

Faith in the Future

If my remarks this evening have not conveyed to you the impression of my optimism concerning the future of the fruit industry of New Brunswick they have indeed failed. While there have been times when my faith in the future of the industry wavered, those times are absolutely things of the past, and I never felt more optimistic concerning the outlook than I do now. The longer I live in this province of New Brunswick the more I like it and its people, and the more I believe in it and its possibilities.

Finally, let the orchard owners here

DAIRYING.

RETENTION OF AFTERBIRTH PREVENTED BY KEEPING COWS IN GOOD CONDITION

Expulsion of the afterbirth is a natural, normal function and the certain evidence of natural condition and good health. That, too, is true of chewing of the cud. If a cow stops chewing the cud she is sick. She never "loses her cud," nor need she be supplied with an artificial cud. She will resume rumination when she recovers. In the same way a cow is sick, or unhealthy when she retains her afterbirth; but it cannot be said, in this instance, that expulsion of the afterbirth will take place promptly when she recovers; for quick recovery does not happen in such cases. Retention of the afterbirth may indicate disease or unhealthiness of the entire system, or be due to local conditions of a diseased or abnormal character. In a majority of instances, however we must conclude that the entire system is more or less out of condition when the afterbirth is retained and that may be true even when the cow is affected with contagious abortion which is notoriously the most common cause of retention.

More and more we are coming to believe that lack of constitutional strength, or natural condition, is the true reason for the hundred and one ailments of our animals. Where natural condition has been lost, resistant power against disease (germs) has gone with it or lessened. When such systemic weakness is great, the tendency to disease will be correspondingly strong and the inability to throw off disease apparent. We pay the penalty in weak constitution, lack of resistant power and susceptibility to all sorts of ailments when we pamper animals for abnormal and unnatural production and "records." The ill effects of pampering may be great or less serious in proportion to the degree of pampering, or to the skill of the manager of the animals in providing every possible advantage of environment to offset the detrimental effects of excessive feeding.

Pamper an animal in a stable where there is "no ventilation", and we may certainly expect her to go wrong in some way or another. Retention of the afterbirth would be one possible and even probable evil effect. Deprive her of daily exercise in the open air, or give her too little drinking water, or water that is contaminated, and similar ill effects may be expected. Then, too, there is the opposite of pampering. The cows that were confined to a stable without ventilation and then fed timothy hay were abused, not pampered, and abuse leads to unnatural and abnormal constitutional conditions that invite disease, or the evidences of disease. such as retention of the afterbirth, or abortion, or suppression of milk flow, to tendency to other diseases, tuberculosis for example.

Retention of the afterbirth does not affect the range cow that is adequately fed and such an animal is so robust that she may even eat her afterbirth with apparent impunity. Half-starve the range cow, however, and all the fresh air and exercise of the range existence might not prevent retention of the afterbirth and that or some other ailment would be likely to affect the animal. The pampered cow cannot eat her afterbirth with impunity. She lacks resistant power against the ill-effects of the decomposing membrances or has not the powerful muscularity of the range cow to get rid of the foreign mass in her paunch. Eating of the afterbirth should be prevented in all circumstances and instances. The constitutional strength which might make eating of the afterbirth a nonserious matter should, by every possible means, be courted and retained. Then retention will not occur, provided contagious abortion or other disease is absent.

With the object of preventing retention of the afterbirth every animal in a herd of cattle should be tested with tuberculin and kept free from tuberculosis, for that disease often causes retention. So, too, contagious abortion should, so far as possible, be kept out of the herd. To that end every cow and the bull should be tested by the complement flaxation method of blood examination. By that means the disease may be kept out of the herd with a fair degree of success. Disinfection of the rear parts and genitals of every cow also should be attended to regularly and the herd bull also should be disinfected to prevent communicable disease. In short, sanitation is imperative in the management of cattle, if disease is to be prevented. Additional precautions in management will include a system of stable ventilation which at all times will provide sufficient fresh air without causing injurious drafts and will remove foul air perfectly. A system of feeding which will adequately provide the needs of the body for maintenance and the demands of the unborn fetus and for the production of milk, without inducing an overfat, constipated condition. A system of management which will insure for every animal sufficient outdoor exercise daily to cause activity of the excretory organs and maintenance of muscularity. Without exercise sufficient for these purposes the system becomes vitiated by absorbed and retained effete matters which should have been promptly voided.

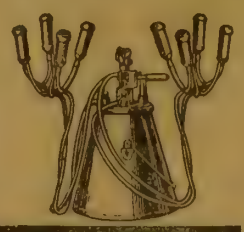
It may in conclusion be advised that the pregnant cow should be dried off for at least six weeks before calving; should have exercise every day; occupy a clean, light, well-ventilated stable and have light, laxative rations which will keep her bowels active. All rich feed should be greatly reduced in quantity and the daily ration of silage should be cut down a third and then a half, at the least, while bran and flaxseed meal may be given in wet condition, to relax the bowels. Retention of the afterbirth will then be unlikely to occur. If actual disease is absent and prompt expulsion may be stimulated by injecting into the vagina every six hours after calving a gallon or two of lukewarm water containing not over one teaspoonful of coal tar disinfectant to the quart, or a like amount of salt may be used if a disinfectant is not available.—A. S. A. in O. V. J.

IT PAYS TO ADVERTISE AND KEEP RECORDS

We have a letter from Arthur E. Dickie of the firm of S. Dickie and Son, Central Onslow, N. S., who are persistent and consistent advertisers in the columns of The Maritime Farmer. Coupled with the latter trait we may add that the Messrs. Dickie are believers in record keeping and by a process of elimination and careful attention to the choice of high quality sires to head their herd from time to time, they have made a name for themselves and their herd in the annals of stock breeding in Canada. These are the reasons, coupled with judicious feeding that have placed their individuals at the head of the prize winning lists in the Winter Fair Dairy Tests.

Messrs. Dickie do not experience any difficulty in disposing of their

"I could not have done without it this Summer, as help is so scarce"



Here is the experience of one of the scores of dairy farmers for whom the

EMPIRE
Mechanical Milker

is taking the place of the farm help they can no longer get, and enabling them to keep their herds together and take advantage of the prevailing high prices.

R. R. No. 3, INGERSOLL, ONT.

Gentlemen:—

I have used one of your "Empire Milkers" since early last April, on from 30 to 45 cows continually, and can find no injurious effects on the cows. They seemed to like it from the first time, and I think gave rather more milk than with the best hand milking. Easy cows seemed less inclined to leak, and hard ones gradually became easier.

I have sent the milk a number of years to the Borden Condenser Company, and have had no complaints. I have just followed the instructions for keeping it clean.

I could not not have done without it this summer, as help is so scarce. I may say further that I have been milking cows for over 50 years, and have been in the milk business nearly that length of time. I have had no previous experience with milking machines, but have had very little trouble or expense for repairs. I have used it on heifers never milked before, with perfect satisfaction, no matter how small their teats were.

The Milker has been of more practical value to me than I ever expected.

WILLIAM COLYER.

We will be glad to send you Booklets showing exactly how the Empire Mechanical Milker works, and telling the experience which dozens of prominent dairy farmers have had with it. Address Dept. L

Many Women Suffer From Pains in the Back.

When the back begins to ache it is a sure sign that there is something radically wrong with the kidneys.

What you want is a kidney medicine. Doan's Kidney Pills are not a cure-all, but a medicine for the kidneys only.

Mrs. L. Melanson, Plympton, N.S., writes: "I am sending you this testimonial, telling you what a wonderful cure Doan's Kidney Pills made for me. For years I had suffered so with my kidneys I could hardly do my housework. I used several kinds of pills, but none of them seemed to be doing me any good. At last I was advised to try a box of Doan's Kidney Pills. When I had taken the first box I found relief. I have used five boxes and to-day I feel like a new woman. I cannot recommend them too highly."

Doan's Kidney Pills bear the trade mark of a Maple Leaf and are put up in an oblong grey box. See that you get "Doan's" when you ask for them.

Price 50c. a box, 3 for $1.25, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

When ordering direct specify "Doan's."

We have been using MINARD'S LINIMENT in our home for a number of years and use no other Liniment but MINARD'S, and we can recommend it highly for sprains, bruises, pains or tightness of the chest, soreness of the throat, headache or anything of that sort. We will not be without it one single day, for we get a new bottle before the other is all used. I can recommend it highly to anyone.

JOHN WALKFIELD.
LaHave Islands, Lunenburg Co., N. S.

surplus stock—they can show authentic records—just the kind of work that Prof. Mitchell wishes to encourage in New Brunswick by his sliding scale of bonuses. We are pleased to note that our Maritime Province breeders are one by one falling into line in the work of cow testing and just as soon as they will have some good records to show, as some of them already have, just so soon will the cry of difficult sales cease.

The letter in question reads as follows and speaks for itself:—

"Enclosed you will find change of copy for our advertisement in The Maritime Farmer. Our sales have been very good during the Fall and Winter, totalling fifteen head. We find the buyers getting more exacting all the time in regard to breeding, production records and individuality.

"The young bulls we are offering in the enclosed advertisement are sired by Royalton Canary Majir whose dam, Royalton DeKol Fern, has an official record of 34.60 pounds butter in seven days, 116 pounds milk in one day. This grand old cow's three-quarters sister, Royalton DeKol Violet recently completed a years test with a record of 29,963 pounds milk and 1300.4 pounds butter to her credit at 10 years of age, which entitles her to the Worlds record for that age.

"We bred a number of cows to Colony Canary Rag Apple whose dam, Wadmantje Canary has official records of 31.38 pounds butter in seven days, 354.95 pounds butter in 90 days as a junior four year old and 33.06 pounds butter in seven days as a five year old. This cow is considered to be one of the finest cows in Canada. The calves sired by Colony Canary Rag Apple are the finest we have ever seen barring none. We have also a number of very fine calves by a young bull of our own, that we think is some bull. He is Prince Colanthus Abbekirk B., whose dam is Madam Pauline Canary that has an official record of 30.00 pounds butter in seven days and won second place in the Guelph Dairy Test in 1916. Her dam is Madam Posch Pauline, one of the greatest cows living. Her records at five years old are 34.09 pounds butter and 802.9 pounds milk in seven days, 118.8 pounds milk in one day, 17,476.7 pounds milk and 709.90 pounds butter in six months. As a seven-year-old she made 34.38 pounds butter in seven days and 124.5 pounds milk in one day, 16,989.6 pounds milk and 693.69 pounds butter in six months. The sire of Prince Colanthus Abbekirk B. is out of Pauline Colantha Lemon with a record of 32 pounds butter in seven days and 104 pounds milk in one day and nearly 20,000 pounds milk in one year. Pauline Colantha Lemon's dam, Pauline Colantha Posch has a record of 29.5 pounds butter in seven days. Are we not justified in looking for something good from Prince Colanthus Abbedirk B.? His calves are well marked and very promising.

"On account of it being impossible for us to get the necessary mill feed that we wanted, we did not do any official testing last fall, but we have a couple of fine cows that we intend to try out before long.

"Milk is at a high price but mill feeds are higher."

It is not economy to feed all cows the same amount of grain. They should be fed in accordance with their production. A heavy grain ration given a light milking cow fattens her but does not increase her milk beyond her ordinary limit.

Dairy products will hardly ever get so high that every man keeping cows will make money or so low that every one following dairying will lose money. It is not within the power or province of any one man to make or regulate the markets, but it is in the reach of all to try to adapt what they make to the wants of the market, to be improving his products, simplifying his processes and becoming a better master of his business.

A bull must have plenty of exercise. He does not need to be housed in a warm barn, but is kept in the best condition when given a dry but open shed, with a paddock attached so that he can go in or out at will.

ALPHA

The Best Gas Engine to Buy

WHEN selecting a gas engine, the most important thing is to get a good engine. There is no economy in buying an engine that is going to require frequent repairs and that is likely to balk just at the time you need most to use it.

The wise man considers service, reliability and durability first, and price second. Selected on this basis, the ALPHA is the logical engine to choose, because it is the simplest and most durable in construction and the most reliable in operation. It runs smoothly and powerfully on a minimum consumption of either gasoline or kerosene, and operates on a simple magneto without the use of any batteries.

It is so simple that a woman or a boy can start and operate it, and the sensitive governor, which acts the instant there is the slightest variation in the load, insures steady running without any waste of fuel.

Before you put any money into a gas engine, investigate the ALPHA—and remember that the man who buys the best is never sorry.

Ask for catalogue, prices and complete information. Made in various sizes, 2 to 25 H. P. Each fully equipped, ready to run, either in stationary or portable style, and with hopper or tank cooled if so ordered.

Supplying the Demand for Royal Purple Calf Meal

This baby food for young animals is partially pre-digested, and can be fed to the youngest animals with perfect safety. It WILL NOT cause stomach or bowel trouble, which are serious ailments in young animals. Royal Purple is a sure preventive for scouring.

Calves Gain Rapidly Without Milk

When the calves are 3 or 4 days old they can be fed Royal Purple Calf Meal and raised just as well without one drop of milk. What prominent breeders remark:

Mr. Geo. W. Collins, Plainfield, Ont., writes:

"Gentlemen.—In regard to your Calf Meal, I think you have the best on the market, as people who have bought it give it great praise. Some have taken their calves off sweet milk, and feed them nothing but your Calf Meal and water, and say they are doing as well on it as they did on the whole milk."

To Whom It May Concern: Uxbridge, Aug. 5th

This is to certify that I have secured your "Royal Purple" Calf Meal from our druggist, Mr. T. C. Nicholls, of Uxbridge, and can speak of this meal in the highest terms. I have used other calf meals, but this one is the best I ever tried. I never saw a calf gain more rapidly and thrive better than mine did while using your "Royal Purple" Calf Meal. I can cheerfully recommend it to all our stockmen who wish to raise large, healthy calves."—Stanley W. Croxall.

Note—The above Mr. Croxall keeps a large herd of pure-bred Holstein cattle, and is an excellent authority on Calf Foods.

Royal Purple Calf Meal is equally good for young colts, lambs and young pigs. Put up in 25-lb., 50-lb. and 100-lb. bags. Secure it from our dealer in your town.

What a Price to Pay for the Lack of Safe Roofing
ANOTHER BARN BURNED
SIXTH LOSS IN VICINITY FROM LIGHTNING OR UNKNOWN CAUSE, IN FEW WEEKS
(Special Despatch to The Globe.)
Simcoe, Aug. 28—The barns of Keith Maybee, two miles south of this town, were destroyed by fire early this morning, the property of Fred Beaupre, a neighbor. Both the alarm, but it was too late to arrest the flames.
THE CROP, IMPLEMENTS AND BUILDING WERE ALL DESTROYED
There was some insurance. This is the sixth barn near town that has been burned by lightning or by unknown causes. Maybee is a daughter of Mrs. Owden, one mile out of town, whose barns were burned a fortnight or so ago while threshing was in progress.
PEDLAR'S "GEORGE" SHINGLES

EVER think how often you too have barely escaped a similar disaster—or how soon destructive flames may at any moment envelop all you possess and hold dear?

Real protection insists that you roof your barns and home with inflammable material—Pedlar's "GEORGE" Shingles. Thus you rob lightning and fire of their power to destroy, and, what's more, obtain the base rate of insurance.

Pedlar Shingles are also proof against wind, rain, rust and rot. Easy to put on. Keep your barn sound for generations. Write for the "Right Roof" Booklet M F

HOWICK-HUNTINGDON AYRSHIRE CLUB

Red Cross Drawing.

The Grand Prize drawing for the registered Ayrshire bull calf "BURNSIDE RED CROSS" donated by R. R. Ness, Howick, Que., through the Howick-Huntingdon Ayrshire Club to the Red Cross Society, took place at the evening session of the Huntingdon Dairymen's Convention, held at Ormstown, Que., on the 20th instant. The winning number proved to be 291, held by H. H. Scott, Superintendent, Boy's Farm, Shawbridge, Que. As this is a charitable institution the result is especially fortunate.

This calf was dropped in November 1916 and is royally bred, being sired by the noted "Hobsland Masterpiece" —31717—and from "Auchenbrain Craig 16"—39387—a daughter of "Lessnessock Good Gift"—(7368. On the maternal side she traces in the second generation to St. Simon of Auchenbrain (4400), the sire of "Auchenbrain Brown Kate 4th", so there can be no question but that he will prove a great acquisition to the Ayrshire herd maintained at the Boy's Home at Shawbridge.

The tickets were well spread, every Province in Canada being represented, as well as ten of the United States. The response of the leading American Ayrshire men was particularly gratifying.

Nine hundred tickets were sold and the Club turns over $900.00 to the Red Cross Society, to be divided equally among the branches at Howick, Ormstown and Huntingdon.

Gilbert McMillan,
Secretary-Treasurer.
Huntingdon, Que., February 23rd, 1917.

FEEDING THE BUZZARDS

In the back pasture of a farm was the body of an old ram. The owner knew that the sheep was dead, but the haying was well started and the busy days seemed to offer no slack hour in which to bury the carcass. There was also other stock in the same field. Less than a mile away another farmer's hogs were quickly shuffling off their porcine coils, as cholera scourged the herd. The owner of these hogs was busy too, so he piled a few of the carcasses in the lane, safely away from his other hogs, intending to bury them within a day or two. Within a short time the buzzard began to sail about over head, swooping down to feast on the bodies of the dead hogs. A few days later the farmer with the dead ram in his back pasture noticed that some of his hogs showed unmistakable signs of cholera. Finding time then to go to the field he beheld the buzzards gorging themselves on the remains of his former flock-leader. A comparison of notes by these two busy farmers revealed the fact that each had served a feast for the carrion birds, which had undoubtedly carried cholera from one farm to another.

The only excuse for this unappetizing story is that it is true. We may divide ourselves into schools of anti-vaccine and pro-vaccine, but what excuse is there to take a stand against common-sense sanitary precautions? Not infrequently the statement is made: "The hog is dead, there is no more danger." On the contrary, this case is but a sample of many in which disease is carried through the medium of the flesh of dead animals. Why not dispose of the bodies of all dead animals on the farm? Perhaps they have died of a contagious disease that may be carried by bird or beast to the neighbor's barnyard; or perhaps the carcasses will attract birds bearing

Kept Fit Through Two Wars

Ontario Sapper Praises Dr. Cassell's Tablets.

That a soldier should use and praise Dr. Cassell's Tablets is clear proof of the wonderful sustaining power of this great strength-giving medicine. And thousands of service men on land and sea are trusting to Dr. Cassell's Tablets to sustain them through all the hardships of relentless war.

Sapper Hartley.

SAPPER A. HARTLEY, OF THE A. COMPANY, CANADIAN ENGINEERS, whose home address is **906, TRAFALGAR-STREET, LONDON, ONTARIO,** is one of many who have written in praise of Dr. Cassell's Tablets. He says:—"As a constant user of Dr. Cassell's Tablets I would like to add my testimony to their value. I used them when I was in the South African War, and, finding the benefit of them there, have taken them since whenever I felt run-down. I always recommend them, for I know they do all that is claimed for them. In my opinion they are the best tonic anyone can take for loss of appetite, poorness of the blood, or general weakness of the system. We have had a lot of hard training here, and some time ago I began to feel the strain, but I got some Dr. Cassell's Tablets, and the boys are surprised at what a difference they made in me. I mean to have some with me always on active service."

Dr. Cassell's Tablets put new life and vigour into weak, overstrained people. They nourish the nerves, enrich the blood, strengthen the general system, and create that snap and fitness which make life a joy. Take a course of them, and health and vital energy will soon be yours.

Dr. Cassell's Tablets

diseases from the other herds and flocks. Burning is effective, but not always possible. Burying deep and covering well is also an effective disposition of the dead bodies.—Breeders' Gazette.

KEEPING A BARN BOOK

The essential methods of the large breeding establishment are suitable and essential for the management of the small herd. So small a thing as a memorandum book and a pencil tied together and kept hanging in a secure place in the bull's stall is not to be overlooked. Trusting to memory with even a few cows is to be avoided; trusting to setting down dates of service at some convenient time is not safe; entering dates in a book devoted to general memoranda is not convenient. Far easier and much better is a barn book used promptly and habitually. A page should be given to each cow, and under her name the date of service and the date of calf's birth, with its name. It is an excellent plan to name the calf the day it is born. Of course the herd register kept in the desk will have the birth date and name of each calf properly entered therein, as well as in the barn book. Because the beginner does not always and fully recognize the importance of accurate records we find that breed history abounds in instances where animals have been lost to official record through incomplete entries in personal record books. Many herds have lost their identity by the death of an owner who kept no plain and unmistakable memoranda, and in consequence his estate suffered a substantial loss.

The habit of keeping a barn book and the habit of transferring to the desk herd book a record of additions to the herd under the dam's pedigree would furnish the evidence necessary to identify the animals in the herd.

THE HERD SIRE AND HIS CARE

There are many things to be considered in preparedness when one goes in for purebred cattle. Not only must he find the capital required for the investment, not only must he acquire a knowledge of breeds and their aptitudes in order to make a wise choice, but even within the breed itself he should have a knowledge of the pedigrees that are approved. In addition, however, to these essential things, there is the preparation of the farm and farm buildings for the maintenance and use of a breeding herd. At first there many not be a full appreciation of the necessity for permanent pasture, but it is possible to find fairly satisfactory make-shifts in the quickly-grown forage that may be included in the farm crop rotation.

The most serious point and where the beginner is most likely to hesitate is in the adequate preparation for the care of the breeding bull, the head of the prospective herd. One will decide that he will take his cows away from home for service, and then later will discover that this plan is so difficult in operation that it is likely to entail a loss both in time and in herd increase. Another will seek to save time and labor by permitting the sire to run with the herd in the pasture, and share the ordinary stalls in the barn. This plan is found lacking in orderly business character because it prevents accurate knowledge of when a calf may be expected, if at all; and, moreover, this course is likely materially to affect the usefulness of the sire, and may spoil his temper to a degree that makes him a menace to the neighborhood.

IMPORTANT NOTICE

At the annual meeting held in Toronto in February, 1916, the Canadian Ayrshire Breeders' Association's Constitution was amended. We draw particular attention to the following:

"Transfers must be supplies for all changes of ownerships of animals sold prior to registration and the usual fee will be charged for transfers to third and successive owners."

This means that if you have sold an animal before recording it, you must send a transfer of the animal along with the application for registration. It is not sufficient to place the owner's name as second owner on the application. Please be guided accordingly.

Yours truly,
Canadian National Live Stock Records
JNO. W. BRANT,
Accountant.

LIVE STOCK IN THE ROTATION

Live stock furnishes a means of rotation; the physical condition of the soil is restored by means of the turf produced. A three-year rotation of clover, oats and corn is merely a whirling wheel which by centrifugal force throws a little more richness out of the land than a one or two-crop system. Such rotations encourage rather than arrest depletion. Most soils are the result of vegetable growth and decay, or of residues left by the great game herds. It takes time for the roots and their acids to disintegrate the more solid particles of soil. The older the organic matter the less soluble it has become. It may be rich, but it is inert. High-pressure farming and short rotation will bring big crops. They tear down the soil and turn it into a marketable product. Building up the soil requires that we reverse the process and allow the turf to act on the non-organic substances of the soil. This must be done at a profit or the land will go to waste. It has been done for hundreds of years by the aid of live stock in the rotation. L. Ogilvy.

See the Difference

BETWEEN THE

NEW DE LAVAL

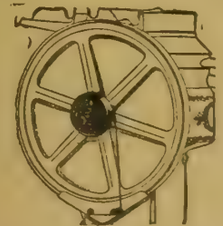
AND OTHER

CREAM SEPARATORS

YOU can *see the difference* between a NEW DE LAVAL and any other cream separator right away.

And five minutes spent in comparing the bowl construction, the size, material and finish of all the working parts, the manner of oiling, the tinware and the frames, will surely convince you of the superiority of De Laval construction and workmanship.

Then if you go a step farther and turn the cranks of the two machines side by side for fifteen minutes, running milk or water through the bowl, you will see still more difference.



Every New De Laval is now equipped with a Bell Speed-Indicator, the "Warning Signal" which insures proper speed and uniform cream.

Speed Indicators can be furnished for use on old style De Laval machines at a cost of $3.00 each.

And if you will run the two machines side by side in practical use, as any De Laval agent will be glad to have you do—the De Laval one day and the other machine the next—for a couple of weeks, you will see still greater difference in the work of the two machines.

There is a De Laval agent near you who will be glad to explain all the improvements and advantages of the NEW De Laval, and who will set and start a machine for you on your farm and let you *prove the difference* for yourself.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for any desired information.

THE HORSE

INTELLIGENT FIRE HORSE

Of all the fire horses in Boston probably none are admired more than the coal-black hitch of Engine 26, which is "at home" in Mason Street, close to the Boston Herald building. It has been determined by actual comparison that the fire horses are better adaptd for fire runs in the central part of the city than are the motor pieces of apparatus. This is because of the narrowness of downtown streets, the constant crowds at crossings, and most of all because the intelligence of the fire horses plays no small part in solving the difficulties that beset the engine guiders in difficult situations.

There is one name that is held almost in reverence at Engine 26's House, and that is the name "Baby." Baby was the off-horse on Engine 26's hitch less than a year ago. He was put into the hitch at a very early age, because of his strength, speed, endurance, and fine horse-sense. At its best horse-sense is said by engine drivers to be a quality that approaches human intelligence closer than the sense of any other animal.

On a day last winter when the streets were slippery with slush, Engine 26 was called for a fire in Columbus Avenue just above Park Square. It was neecssary to pass through Park Square to reach the alarm box from which the fire signal had been sounded.

There are two entrances to Park Square from Boylston Street with a small portion of land between, which is called the "Island." This island was crowded with women shoppers and children, when the first of the fire apparatus swung into Boylston Street.

Patrolman Hoppe of the Lagrange Street police station cleared both entrances to Park Square. This left room for Engine 10, an automobile, to enter on the right, and Engine 26, with its coal-black hitch, on the left.

As a result of the speedy clearing of the square the women and children were left on the island as both pieces of fire apparatus swung into the square from Boylston Street. Engine 10 went through smoothly, but the wheels of Engine 26 skidded a little and started to swing in towards the island. This changed the momentum of the whole piece of apparatus, and the next instant the engine swung sidewise and came crashing down towards the island where the women and children were huddled, little realizing their peril.

The momentum of the engine swung the horses with it. But as the driver realized just what was about to happen he gave a quick jerk on the line that ran to the off-horse. Baby caught the signal. He knew only obedience to orders, which is the discipline of the department. A tug at the line meant "hold," and Baby held.

He stood firm momentarily, braced, and in that moment the people on the island had a chance to jump out of danger's way. The next instant, almost, Baby gave way under the strain, and went down with a broken leg as the engine crashed into the island. The other horses who simply followed the momentum of the engine were not injured,—Baby had stood firm for the one crucial moment. He had obeyed orders as only a fine intelligent horse could do.

Baby, of course, had to be humanely destroyed as are all horses that break their legs, but there are at least a dozen persons in Boston today who owe their lives and health to his intelligence.—By E. P. Kelly in Our Dumb Animals.

COMPANIONSHIP WITH HORSES

Already one sees matched pairs of big horses on the roads and in the little towns. Men are getting their horses accustomed to working together as they want them for the summer. Frequently it is some old quiet team, perhaps of different sizes and colors, that is kept sharp-shod and used steadily throughout the winter. It is a matter of convenience, and when the wind chills to the bone a driver thinks more of comfort than of appearances. Now the season of spring work is drawing near and there are more good-looking farmer's outfits to be seen. Some of the horses are young and frisky; some are thin; all are long-haired, but they show signs of recent stabling, grooming and grain-feeding.

One of the great satisfactions of farm life is the inherent pride in horses which prompts men to make their teams appear to good advantage. There is a fundamental affection for the horse which stirs the driver to devotion and attention to the animal's welfare. Undoubtedly there is a reciprocal sentiment. Horses appreciate it. The mutual attraction between horses and driver is one of the forces which stirs farmers to put forth their best efforts in field and paddock.

When we come to think of it in this way, it is evident that the kind of horse a man works is likely to affect his efficiency. In summer a farmer spends more of his waking hours in the company of his teams than in the company of his wife. If the horses are strong, active, well-behaved and good-looking, they radiate a substantial inspiration to do good work and lots of it. It is much easier and pleasanter to do a big day's work with a team that takes the lead and steps lively, than it is to hammer a day's work out of a team of sluggish plugs. One buoys up the spirits; the other drags down ambition to a dead level.

The good wife should be thankful if her husband drives good horses. During the long hours he must spend in the field they preserve in him the happy frame of mind to appreciate kindness, affection and devotion. A man cannot be in his best frame of mind after a day of constant vexation. It is the time-honored habit of men to admire women and horses. It is also the man's privilege to choose his wife and select his horses. If he exercises good judgment and follows it up with good care, he enjoys and preserves companionships that are both ennobling and of practical intrinsic value.

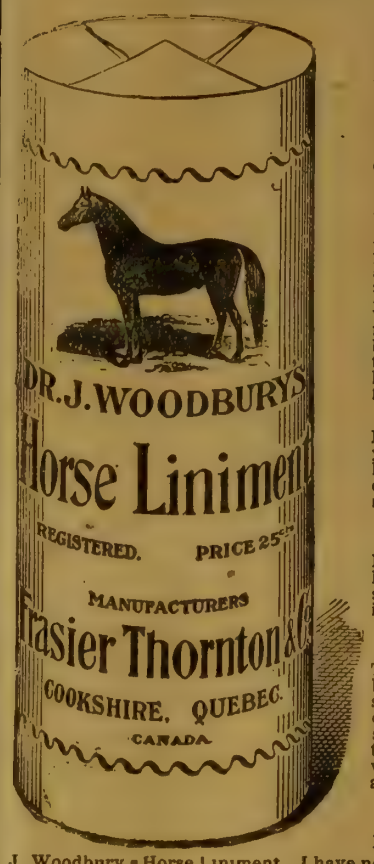
GREASE HEEL

I have a very bad case of "grease heel" in my horse. I have been doctoring him for more than a month and can see but little improvement. I have used poultices, washed the leg with castile soap and water and fed saltpetre in feed. The poultices bring the swelling down but the fever remains. J. K.

Grease heel generally follows scratches that are neglected and it is also due to impure blood or general bad condition in a horse. It is sometimes brought on by clipping horse's legs in cold, wet weather. It is hard to effect a complete cure, but you can relieve your animal to a certain extent by giving a physic drench, say 8 to 10 drachms of bitter aloes, one tablespoonful ginger, one tablespoonful

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

Cured by

VENO'S LIGHTNING COUGH CURE

Have you ever had that kind of cough that strains your whole body and hurts so much that you are afraid to cough at all? It is dangerous, because the excessive strain may cause some internal displacement. But take Veno's Lightning Cough Cure, and the danger is soon past. Veno's relieves at once. The cough becomes quite loose and is soon cured by this incomparable remedy. Every cough yields to Veno's. Try it. Prices 30 cents and 60 cents, from druggists and stores throughout Canada.

"TITE WAD" "STICKS LIKE A BULL-DOG"

Price $1.50 per bottle. Sold by druggists, or sent by us express prepaid. Write for Booklet B.
The LAWRENCE-WILLIAMS COMPANY, Toronto, Can.

common soda. Bathe the legs with warm water and castile soap twice a day and after rubbing dry, wash with white lotion to which is added a few drops of carbolic acid. When the horse can be left in stable and is not required at work, he will be benefited by poulticing with hot bran and linseed meal, but care should be taken that neither cold nor wet should be allowed to affect them for sometime after poulticing. If the disease should show signs of little red growths around the heel, these will have to be burned off with burned alum or caustic potash, which is bought in the form of sticks. You must persist with the treatment, as it sometimes takes quite a long time to affect a cure. Keep the horse's bowels in laxative condition and feed bran mashes liberally and add one tablespoonful of epsom salts to feed daily.

WOUND IN FROG OF HORSE'S FOOT

I have a horse that drove a snag into the centre of the frog in front foot. It has broken out now on top of heel under fetlock. I cannot get it to heal up and the horse is pained and goes lame. What had I better do? D. N. B.

Do not try to heal up the wound until it has been properly cleaned out. If taken as soon as it breaks out on the top, poultice for 24 hours with hot bran and linseed meal mixed to soften all the parts. Then give the diseased part vent at the bottom, to allow the matter, if any, to run out there if it will, but if none is found at the bottom do not cut the hoof to make it bleed. Open the wound freely at the top, do this gently with a piece of smooth whale bone or similar article. Cut out a V shape piece in the hoof, carefully below where the running appears at the top to allow the matter to run out at the lower end of the wound. Then sponge it out with warm water to cleanse it and follow with a lotion made as follows:

2 drachms sulphate of copper in ½ pint of water. Inject well down into the wound twice a day. If the above mixture burns or causes the wound to dry up add a little more water to it. In ten days, if the wound does not appear to be getting better change lotion to following: 3 drachms sulphate of zinc in ½ pint water. Be careful that the opening is down to the bottom of wound and you will have no trouble in curing it. Keep the shoe off till the foot is well enough to work; and then put on a bar shoe so as to protect the weak quarter.

THE RETREAT OF THE SCRUB SIRE

A county agent in Kansas sends out a letter to his constituency, admonishing as follows: "Are you aware of the fact that of the 51 stallions standing in Wilson county only 41 percent are purebred animals? With this condition existing is it possible for you to get the full value of the breeding fee expended? Concerted action on the part of the farm bureau members in insisting that only registered animals be used will crowd the scrubs to the background. Begin this spring."

This is representative of the fight against the scrub stallion the country over. All forces tending to agricultural progress are aggressively allied against the scrub sire. That the fight is being waged with telling effect is attested by the annual reports of the stallion enrollment boards. The purebred sire is gradually pushing the scrub to the background. But all in all there is a large lump to be leavened and there still remains plenty of constructive work to engage all willing hands.—Breeders' Gazette.

$1. for a Horse
Save a horse and you won't have to buy one. Don't sell or destroy any horse on account of Spavin, Splint, Ringbone, Curb, Sprains or Lameness. Spend one dollar for a bottle.

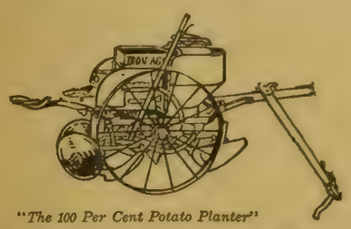
WORMS IN HORSES

Horses that have worms become unthrifty, their hair gets rough and they lose condition, although they may continue to have a good appetite. A worm remedy that is suggested by the University of Missouri is made as follows: Powdered nux vomica, 2 ounces; powdered gentian root, 4 ounces; powdered areca nut, 6 ounces; sodium chloride, 4 ounces; arsenious acid, 2 drams. These should be mixed together and a heaping tablespoonful given for every 250 pounds of weight, every morning and evening for about ten days. The medicine may be mixed with ground feed or sprinkled over oats and corn which has been dampened.

Don't Waste the "Golden Nuggets"!

Make every seed-piece count, yet make sure of a full stand. This boy will help you do 100% potato planting, with no doubles and no misses. He will save you 1 to 2 bushels per acre—some say a barrel. He earns his way many times over. You can't afford to do without him. Use the seed-saving
IRON AGE Potato Planter
It plants as fast as the team can walk, spaces the seed evenly and at uniform depth. Has no pickers—nothing to cut or bruise the seed. Spreads the fertilizer and thoroughly mixes it with the soil so that it can not injure the seed. Can be had in two styles with or without fertilizer attachments and with choice of furrow openers.


"The 100 Per Cent Potato Planter"

POULTRY.

THE BIRTH OF A CHICKEN

(Reprinted by Request)

An infertile egg, or rather one without a germ, is termed "clear." A fertile egg becomes "addled" or rotten when the germ dies before the chick is formed.

Life is perceptible in about a day after incubation begins. The first appearance of red blood is found on the yolk-bag toward the close of the second day. The heart appears on the third day. The pupil of the eye can be distinguished on the fourth day. The lungs begin to form on the fifth day. The gall-bladder is first seen on the sixth day. The bill is noticeable on the seventh day. The brain, wings, thighs and legs are formed on the eighth day. The bones are shaped on the ninth day. The muscles of the wings are completely formed on the tenth day. The arteries begin to be distinct on the eleventh day.

On the twelfth or thirteenth days, if the membrane enveloping the white of the egg be examined very cautiously by opening the shell, it will present, Blumenback says, without any artificial injection, one of the most splendid spectacles that occurs in the whole organic creation—the most simple, yet the most perfect substitute for the lungs. It exhibits a surface covered with countless blood vessels, venous and arterial, branching through its texture. The veins are of bright scarlet color, carrying oxygenated blood to the chick; while the arteries, on the other hand, are of a deep crimson or livid red, bringing the carbonated blood from the body embryo. The functions of the two are thus the reverse of those they perform after the chick respires.

On the fourteenth day, the feathers appear, well developed. Day after day then the growth goes on, and by the nineteenth day the embryo frequently utters a sound. On the twenty-first day, the shell breaks and the chick is born.

There used to be a belief that the chick was freed by the mother breaking the shell. The use of artificial methods for hatching has clearly proved that belief to be wrong.

Present-day poultry science gives these facts in the development of the chick:

Twelve hours after incubation has begun, the lineaments of the head and body are discovered. Close observation has found the heart to beat by the close of the day. At the end of forty-eight hours, two vehicles of blood are distinguished, and pulsation of which are visible. At the fiftieth hour, an auricle of the heart appears. At the end of seventy hours, undistinguished wings, and on the head two bubbles for the brain, one for the bill, and two others for the forepart and hindpart of the head. The liver appears toward the fifth day. At the end of one hundred and thirty-one hours, the first voluntary motion is observed. Seven hours later, the lungs and stomach become visible, and the intestines, the loins, and the upper jaw was seen at the end of one hundred and forty-two hours. The seventh day, the brain, which is slimy, begins to have some consistence. At the one hundred and ninetieth hour of incubation, the bill opens and the flesh appears in the breast. Four hours after that the sternum is seen, that is to say, the breast bone. At the two hundred and tenth hour, the ribs come out of the back, the bill is very visible, as well as the gall bladder. The bill becomes green at the end of two hundred and thirty-six hours. About four hours later the feathers begin to shoot out and the skull becomes gristly. The eyes appear at the two hundred and sixty-fourth hour; and at the two hundred and eighty-eighth hour the ribs are perfect. At the three hundred and thirty-first hour, the spleen draws near to the stomach, and the lungs to the chest. At the end of three hundred and fifty-five hours, the bill frequently opens and shuts, and at the end of four hundred and fifty-one hours, or the eighteenth day, the first cry of the chick is heard.

Thus, it is by so many different degrees that these creatures are brought into life. All these progressions are made by rule, and there is not one without sufficient reason. No part of its body could appear sooner or later without the whole embryo suffering; and each of its limbs appears at the proper moment.

How astonishing, says a noted English writer, that all the parts of an animal's body should be concealed within this egg, and require nothing but heat to unfold and quicken them into life—that the whole formation of the chick should be so constant and regular that at exactly the same hour all these changes will occur, in the generality of eggs, and that the moment it is hatched it is heavier than the egg was before.—M. K. Boyer.

THE FEATHER EATING HEN AND HER CURE

When the hens are shut up in small quarters they are liable to form the disagreeable habit of feather-eating. This is due in most cases to some deficiency in the ration. While it occurs most commonly with birds that are closely confined it will sometimes develop with flocks that have wider range. Insect parasites is one of the most frequent causes. The birds in pecking themselves pull out their small feathers and swallow them. If the diet is unsatisfactory the moisture in the pinfeathers seems agreeable to the taste and they continue until the habit is formed. From plucking their own feathers they soon learn to pluck them from one another. The accident of pulling a feather

Look for the Roll with the Paroid Label

NEPONSET Paroid Roofing has achieved a reputation during the last 19 years that is the admiration of all competitors, and this warning is for your own protection.

Paroid makes the one roof which cannot crack, rot, rust, or dry out, and is endorsed by the National Board of Fire Underwriters for its fire protection qualities.

Your guarantee of satisfaction lies in the Paroid roofs that have stood the severest weather during the last 19 years, and are still in fine condition.

Try an Ad in the FARMER

when relieving the irritation caused by vermin leads to the habit but is not enough to confirm them in the vice if they are fed plenty of green material and animal matter. Birds forming the habit at moulting time may sometimes keep themselves partially naked all winter by pulling their pinfeathers as fast as they start.

One of the first things to be done is to separate the feather-eaters from the flock, as the vice is one that may be taught to others. In fact it is usually one or two birds at first that start the habit. Confining them in a small coop and feeding them well for two or three weeks will often result in remedying the habit. Away from other hens and well fed they seem to forget the feather pulling. If this is not effective put another hen in the same coop, after covering her with carbolated vaseline or some other substance that the birds will not like the taste of. This need not be used on the entire body bur on the back and parts that the feather-eater usually attacks. When this does not effect a cure a sharp knife should be used and the bird served on the family table. In valuable flocks when it is not desired to kill the hen, file the mandibles of the beak so they will not quite meet. This will not hinder the bird from eating but it will prevent her from grasping the feathers with sufficient strength to pull them out.

Idleness in the pens may cause the forming of the habit. Keep the birds busy. Make them work for their food and they will not be so liable to get into mischief. We have heard it said that certain breeds are more subject to this vice than others, but this seems to be a fallacy. If conditions are not right birds of any breed will contract the habit. A small quantity of sulphur fed in the mash occasionally will often prevent the vice and perhaps correct it when first formed.

CHAS. H. CHESLEY.

PREPARING POULTRY PRODUCE FOR MARKET

The householder who buys a poorly nourished and carelessly marketed chicken or fowl secures a very inferior article of food, whereas the purchaser of a well finished and properly prepared, crate fed bird, obtains a luxury. There is a corresponding difference between grades of eggs that are offered at many stores. To enlighten poultry keepers in the method of preparing both poultry and eggs for the market and placing thereon, the Dominion Department of Agriculture has issued an excellent bulletin. It is written by Mr. F. C. Elford, Dominion Poultry Husbandman and issued as Bulletin No. 88 of the Experimental Farms. It treats the subject in paragraphs bearing the following heads:—

Preparing Poultry Produce for Market, System of marketing, Packages, Marketing, Crate Feedinf, Killing, Plucking, Cooling and Packing.

The Bulletin is helpfully illustrated in showing the proper and improper methods of packing poultry as well as of modern egg cases, crates and other features connected with the industry.

The frontispiece, printed in coolrs, represents the roof of a bird's mouth, showing precisely where to sever the artery to bleed and where to penetrate the roof of the mouth to strike the brain causing immediate insensibility and easy plucking.

Copies of this Bulletin are obtainable from the Publications Branch of the Department of Agriculture at Ottawa.

More or Fuller Cans

Those who use Royal Purple Stock Specific secure from *3 to 5* pounds more milk from each cow per day. Figure the increase on even a small herd. It will pay you to feed Royal Purple to your cows, and steers can be fattened a month earlier by its use.

Royal Purple Stock Specific

is a digester, tonic, an animal conditioner. It aids digestion and assimilation and enables stock to get the maximum amount of good from the food eaten. Greater gains are secured from less grain, and the cost of the Royal Purple fed is very trifling. It will improve the condition of the worst, most run-down animal on your farm.

If you have a poor, miserable, run-down, hide-bound horse in your possession, try it on him first and be convinced.

Royal Purple Stock Specific is put up in 50c. packages and $1.50 and $5.00 tins.

W. A. Jenkins Mfg. Co., Ltd.
London, Canada

37

FREE BOOK

Write for FREE 80-page booklet on the common diseases of stock and poultry and our other products. It tells how to raise calves without milk, also how to build hen-houses.

Cases of Eggs Winter and Summer

Keep your fowl healthy, active and vigorous by feeding Royal Purple Poultry Specific in their mash, once daily, and you will certainly get eggs, winter and summer.

Mrs. W. Jackson, Saskatoon, writes:
"Gentlemen,—I tried feeding your Royal Purple Poultry Specific last winter. I had fresh eggs all the time. Sold eggs from January to the 1st of March, and I know it was the Specific did it, and the hens looked healthy after using it. I started feeding them again this fall, and got eggs in less than a week."

Royal Purple Poultry Specific

Manufactured from roots, herbs, minerals, etc., is a complete substitute for the grasses, seeds, herbs and insects the hen picks up during the summer, necessary in making hens lay. Royal Purple Poultry Specific tones up the whole system, keeps the stomach and bowels right—prevents diseases, such as Cholera, Roup, Rheumatism, Typhoid and kindred diseases.

Mr. J. Brandon, Ayr, writes as follows:
"Dear Sirs,—Kindly send me one of your booklets. We djdn't have an egg all winter until we started using your Royal Purple Poultry Specific, and it is the best thing I have ever used. We are getting eleven to twelve eggs per day now on account of feeding them the right food."

Sold in 25 and 50c. packages and large $1.50 air-tight tins. Send for our FREE 80-page book on the common diseases of stock and poultry.

Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

CANADIAN BORN

We first saw light in Canada, the land beloved of God;
We are the pulse of Canada, its marrow and its blood;
And we, the men of Canada, can face the world and brag
That we were born in Canada beneath the British flag.

Few of us have the blood of kings, few are of courtly birth,
But few are vagabonds or rogues of doubtful name and worth;
And all have one credential that entitles us to brag——
That we were born in Canada beneath the British flag.

We've yet to make our money, we've yet to make our fame,
But we have gold and glory in our clean Colonial name;
And every man's a millionaire if only he can brag
That he was born in Canada beneath the British flag.

No title and no coronet is half so proudly worn
As that which we inherited as men Canadian born.
We count no man so noble as the one who makes the brag
That he was born in Canada beneath the British flag.

The Dutch may have their Holland, the Spaniard have his Spain,
The Yankee to the south of us must south of us remain;
For not a man dare lift a hand against the men who brag
That they were born in Canada beneath the British flag.

—E. Pauline Johnson.

WHAT THE DEPARTMENT OF AGRICULTURE IS DOING FOR THE WOMEN OF NEW BRUNSWICK.

The New Brunswick Department of Agriculture is to be congratulated upon its efforts in bringing to the women of the Province a new knowledge of old subjects. For the practical study of such homely but necessary topics as millinery, cooking, sewing, home nursing and first aid, house planning and furnishing and a special class for Mothers, four short courses, each one of ten days' duration, are being held in the Agricultural Schools at Woodstock and Sussex. The work is being promulgated by the Women's Institute Division of the Agricultural Department, whose aim is ably set forth by the motto which graces the shore course programme, "For nothing lovelier can be found in woman than to study household good."

Miss Hazel E. Winter, Supervisor of Women's Institutes, in charge of the courses, has been fortunate in securing the services of competent and qualified teachers, each a specialist in her own specific line of endeavor.

Twenty-five years ago, in the city of New York, the Home Economics movement was introduced by Mrs. Helen Richards. Before this time, however, Economics pertained largely to money matters of the state. Today, "Home Economics stands for the utilization of the resources of modern science to improve the home life," and with this object in view and ever kept before the minds of the students, two successful Home Economics short courses have already been held at Woodstock. The attendance averaged twenty-four for the first course and fifty for the second. The courses at Sussex promise to be even better attended.

Miss Grace Tompkins, Milliner and Dressmaker, of Hartland, N. B., is in charge of the millinery and sewing classes. It is most interesting for the observer to see the students wending their way to the school as early as 8.45 in the morning with hat-bags and sewing materials, that they may be in their places to begin work at sharp nine o'clock. With the first lesson begins the interesting work of making over an old style hat into an up-to-date one. This cannot be accomplished, however, in the one lesson, but when completed, the teacher shows her pupils how to brighten trimmings, renew velvets, clean and color straws. With these accomplishments the delightful task of covering Spring shapes is the next move and at the close of the course pupils have in their possession a "once-laid-aside" hat converted into a modern one, and a new hat ready for Spring wear, together with the knowledge of knowing how to make and trim hats in the future.

The theoretical and practical cooking clases are directed by Miss Ada B. Saunders, of Florenceville, N. B. Miss Saunders was graduated from Mount Allison Ladies College, at Sackville, N. B., in Household Science, and is also Miss Winter's assistant.

Of exceptional interest is the cooking class. In these days of the abnormally high cost of living, one who can teach how to get the most out of the least, is truly a public benefactor. Miss Saunders shows by precept and example the food values of different food stufis, their combinations, and her every lecture is a revelation of the power every woman can exert if she imparts her knowledge gained through listening to the lectures. Knowing, however, that there is nothing which will fasten a theory in the minds of students as the practical working out of such a theory, with the laying aside of notebooks and pencils, work aprons are put on and soon all are busy preparing palatable and nutritious dishes. There are egg, dessert, pastry, apple, bread, fish, left-over and cake days, and one entire lesson is devoted to the correct serving of a three-course, properly balanced dinner.

The theme for this lesson is "Simplicity and Perfection." Such timely suggestions as conserving strength, budgeting time and saving steps are given, thus students are shown by actual demonstration that the family meal can be served without the assistance of a maid with little inconvenience. Miss Saunders says that the girl and boy, even before their teens, should be taught to help Mother at meal time, and when once they become accustomed to the proper method in serving, are invaluable for the assistance they render.

Little booklets on "Apples," "Fish" and "Left-overs" are given to the students as well as printed recipes of each day's lesson. At the close of the first course one student was heard to remark, "Here I have copies of all the recipes used in this course and how precious they will be to me in my home. I have looked them over carefully and I do not believe there is an expensive one among them." Quoting Hayward, it would seem that "dishes have been invented so attractive that they unceasingly renew the appetite, and which are at the same time so light that they flatter the palate without loading the stomach."

Again the observer sees the student returning to the school, with work-bag (and a precious bundle under one arm for the sewing period from two until three. The introduction to this class is to first of all master the various stitches by hand, properly take measurements, lay a pattern, cut and make a fitted lining. With these accomplishments begins the fascinating work of making a tailored blouse and a one-piece dress. Miss Tompkins gives suggestions for the tall, slight woman, the short, stout woman, etc., the styles for the Spring and Summer of 1917, and impresses her class with the fact that "the pursuit of

Women Once Invalids

Now in Good Health Through Use of Lydia E. Pinkham's Vegetable Compound. Say it is Household Necessity. Doctor Called it a Miracle.

All women ought to know the wonderful effects of taking Lydia E. Pinkham's Vegetable Compound even on those who seem hopelessly ill. Here are three actual cases:

Harrisburg, Penn.—"When I was single I suffered a great deal from female weakness because my work compelled me to stand all day. I took Lydia E. Pinkham's Vegetable Compound for that and was made stronger by its use. After I was married I took the Compound again for a female trouble and after three months I passed what the doctor called a growth. He said it was a miracle that it came away as one generally goes under the knife to have them removed. I never want to be without your Compound in the house."—Mrs. Frank Knobl, 1642 Fulton St., Harrisburg, Penn.

Hardly Able to Move.

Albert Lea, Minn.—"For about a year I had sharp pains across my back and hips and was hardly able to move around the house. My head would ache and I was dizzy and had no appetite. After taking Lydia E. Pinkham's Vegetable Compound and Liver Pills, I am feeling stronger than for years. I have a little boy eight months old and am doing my work all alone. I would not be without your remedies in the house as there are none like them."—Mrs. F. E. Yost, 611 Water St., Albert Lea, Minn.

Three Doctors Gave Her Up.

Pittsburg, Penn.—"Your medicine has helped me wonderfully. When I was a girl 18 years old I was always sickly and delicate and suffered from irregularities. Three doctors gave me up and said I would go into consumption. I took Lydia E. Pinkham's Vegetable Compound and with the third bottle began to feel better. I soon became regular and I got strong and shortly after I was married. Now I have two nice stout healthy children and am able to work hard every day."—Mrs. Clementina Duerring, 34 Gardner St., Troy Hill, Pittsburg, Penn.

All women are invited to write to the Lydia E. Pinkham Medicine Co., Lynn, Mass., for special advice,—it will be confidential.

THIS WASHER MUST PAY FOR ITSELF

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right, but pay me first, and I'll give you back your money if the horse isn't alright."

Well, I didn't like that. I was afraid the horse wasn't "alright" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

Our "Gravity" design gives greatest convenience, as well as ease of operation with quick and thorough work. Do not overlook the detachable tub feature.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see, I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, *before they pay for them*, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six minutes. I know no other machine ever invented can do that without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight, too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that on washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50c a week till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes six minutes.

State whatever you prefer a washer to operate by Hand-Engine Power-Water or Electric Motor. Our "1900" is very complete and cannot be fully described in a single booklet.

Address me personally, S. E , Morris, Mgr., Nineteen Hundred Washer Co , 357 Yonge St., Toronto, Ont. (Factory: 79-81 Portland St., Toronto.)

things fashionable for the sole reason that they are fashionable, is not an exalted occupation and is, indeed, a somewhat sheeplike attribute." While the students are putting final touches to their work the closing day in the millinery and sewing classes, Miss Tompkins gives it careful inspection and awards, not for the quantity, but for the quality, the prize of $5.00 as given by the Department of Agriculture.

Miss Gertrude MacKinnon, of Fredericton, N. B. who was graduated from the Fredericton Victoria Public Hospital and afterwards took a post-graduate course at Corey Hill Hospital, Brookline, Mass., is the teacher in hone nursing and first aid and the special class for Mothers. Her periods each day are from three until four and five until five-forty. Having had the experience of a teacher, Miss MacKinnon makes her lectures so forceful and her questions so direct, a pin can be heard drop at any time during her classes. Although she impresses you with the fact that "just health is a lot to be thankful for, plain every-day health; with everything working together so well you don't ever think about your system at all, yet the time will inevitably come when some one in the home becomes ill and a nurse is required. If the daughter or mother is qualified, **and has the strength,** to take care of the sick, so much the better for the family income. Then is shown from day to day by lecture and demonstration, and the helpful suggestion coming from a student who has had to care for a sick person, the essential points in home nursing. Naturally, the location of the sick-room, proper ventilation, contents, its care and the garb of the nurse receive first attention. The second day is taken up with the interesting work of preparing the bed for different cases. The third day one of the pupils becomes suddenly ill, (accidentally on purpose) is undressed, and put in bed. She is given an alcohol bath and behold—is completely restored to health.

From day to day follow helpful lectures on contagious diseases among children, fumigation after contagious diseases, observation of symptoms, administration of food and medicine. Demonstrations to better impress the students how to care for helpless patients. what to do in the care and treatment of emergency nursing are given. "Keep cool" is the first axiom for the nine common emergencies Miss MacKinnon treats. They include scalds and burns, fainting, epileptic fits, shock, drowning, hemorrhage, bleeding from the nose, sprains and fractures. All evidence much interest in the several bandaging demonstrations and at no time does Miss MacKinnon find it difficult to secure a patient in her class.

The class in house planning and furnishing is at a popular hour in the afternoon, from four until five. Members of the Institute in the town who cannot find it convenient to leave their home duties in the morning, attend the afternoon lectures and are enthusiastic over this class. Miss Elaine Borden, of Sackville, N. B. the teacher, is a graduate of Mount Allison Ladies College and has also taken a post graduate course in Arts and Crafts at Columbia University.

The first and second lessons treat with the house, the four types of American Domestic architecture and how they are recognized. These are illustrated with pictures and charts of colors for houses and roofs. Miss Borden invites discussion and with illustrations of house-plans on the blackboard, explains the convenient arrangement of the rooms. A home task for the student is to draw a plan of a well-arranged house. "Thoughts are but dreams till their effects be tried," and the originality of the students in this regard is very pleasing to the teacher. "A house plan is regarded as being successful only when it meets the requirements for comforts and convenience of the particular family for which it is intended."

Fix Up Your Barn and Make Work Easy

Do your chores in half the time. Feed and water the cows quicker, clean the stable quicker, fill your mows in a hurry at harvest time. Modern fittings for the barn save work enough to pay for themselves in a few years. They are the solution to the labor problem.

Barn Book Shows How

It tells how to build a barn from start to finish and how to fix it up. Shows how to do all the cement work yourself and build and erect the frame. Tells about the BT Steel Stanchions, Steel Stalls, Steel Horse Stable Fittings, Water Bowls, Hay, Feed and Manure Carriers.

Send Coupon

Book is fully illustrated with blue print plans and full page photographs, and many useful tables of cost of cement work, capacities of mows, etc. It is invaluable to any man who is building a barn. The regular price is $1.00, but we are sending one copy free to every farmer who builds. Simply mail coupon.

the things they must perforce use, that is the one great office of decoration." The study of color is very interesting, and Miss Borden shows by a blackboard drawing how the location of various rooms very often decides the color scheme.

A short history of old English furniture, Tudor, Jacobean, Dutch influence and Georgian, with their effect on early and modern American furniture comprises the fourth lesson. Pictures of these types of furniture are shown and the student better understands the characteristics of the various styles. The rooms in the house specifically discussed include the bedroom, bath-room, living-room, dining-room and kitchen. Such hints are given as "usefulness and beauty should go hand in hand, as far as possiblefi in making selections, but the useful should always lead the way." "One thing to be studiously avoided is overfurnishing." "Simplicity is always in good taste, no matter what it is dealt with."

The arrangement and planning of convenient kitchens and labor- saving devises was possibly the most interesting lecture of this class and called forth more discussion. "A woman who does the housework for an average family walks as far as the distance around the world in six years. She can be saved nearly half that walking by a properly arranged kitchen." The modern kitchen should be small and square, plenty of wall space and ventilation, with a north-east exposure. The working surfaces should be even with the palm of the hand and the aim should be to do the most work in the least time. Much practical information was given, and the pictures of the ideal kitchen Miss Borden passed around made every housekeeper present realize that although she could not have all the modern appliances included in those pictures, at least she could so re-arrange her kitchen and introduce some devices as would make housework less burdensome for her.

The special class for Mothers, like the millinery, was newly introduced this year, and their popularity and helpfulness indicate that by all means they will be included in the courses for 1918. The young mother may be in the majority, but the grandmother and young, unmarried woman attend this class; the grandmother to give the younger folk present the benefit of her experience, and the young woman to learn all she can of what is to benefit her in married life.

"Of all sad things of tongue or pen, the saddest of these, 'It might have been.'" More than one young Mother was heard to remark "Oh if I had only known that before my baby came, what trouble could have been avoided." From day to day lectures are yiven on baby hygiene, care of Mother before confinement, preparation for confinement, preparation for confinement, care of Mother for first week, care of baby for three days, convalescence, complications followiny confinement and sex hygiene. As in the home nursing class, on the ninth day any personal questions which have previously been placed in a question box, are answered. Not even the nurse knows who asks them, so this does away with timidity on the part of students to have matters solved that have been puzzling them. One can readily understand the value of such a class on the present and coming generations.

The Department of Agriculture makes it possible for women in all parts of the Province to obtain the knowledge derived from such courses. All railway fares over Two Dollars are refunded, then each student has the equal chance of winning in prizes amounting to Ten Dollars, the sum of Five Dollars being offered in the millinery and sewing classes combined, coobing, home nursing and first aid, house planning and furnishing, and the special class for Mothers, making a total of Twenty-five Dollars offered at each course.

The intrinsic value of these Home Economics short courses cannot be overrated. The sociability is a strong element of the course. Thirty students are permitted to enter the millinery, cooking and sewing classes, when twenty-four is what the public school considers a large class. While fingers are busy, tongues very often keep pace with them, and frequently students, who all by the way are members of Women's Institutes, give and gather data concerning Women's Institute work that will be benevcial to their Institutes upon their return home. Some women have joined a branch merely to take the course but they listen attentively to the discus-

GRAY-DORT ROADSTER
3 PASSENGER FLEUR-DE-LYS $910

Quickest Motor Car Success in Years

The motor car industry has seen some wonderful successes—but never a more astounding triumph than that of the Gray-Dort.

Our first model was announced in December, 1915. The Gray-Dort was then unknown. Only one announcement was made. *But in 3 days our entire 1916 output was sold.* Dealers clamoured for more cars. Many motorists were disappointed.

For 1917 we increased our output tremendously. But the same scenes were repeated. Dealers came from all over Canada and asked for more than the entire output.

"The Quality Goes Clear Through"

It's a Wonderful Car

Wonderful Motor Silent, powerful, light and efficient, thrifty of gasoline and oil, speedy.

Wonderful Comfort Lots of room in the seats—lots of leg room—deep upholstery—long cantilever springs—handy driving—Westinghouse starting and lighting—easy gear shift.

Wonderful Value We have built this car with the sole aim of consistent continued performance of the very highest standard. Materials are of the finest—construction honest. The value is unprecedented.

Children Like It

It is not an easy matter to get a medicine that children like, or to force them to take one they don't like. Most mothers know that a cough medicine, while palatable, should contain no drug injurious to the child. The great popularity of

Chamberlain's Cough Remedy

is explained by the fact that it contains no opium or narcotic of any kind, and at the same time is so pleasant and agreeable to the taste that children like it. For this reason it is a favorite with the mothers of young children.

Yours for health,

—Gramj Chamberlain

sions and here and there one decides "if the one she has joined is too far away for her to attend the meetings, she is going to do her best to interest the women in her community to organize a branch." Bless her, that woman believes in progress!

The other classes are not limited in number so each day sees every chair occupied, and the worth of the entire course is summed up in the words of the students, "It is a privilege every housekeeper should take advantage of."

Similar courses will be given the winter of 1918, with very likely one or two new classes introduced. It is to be hoped that as many women as possible will avail themselves of this educational instruction so vitally important to the home of New Brunswick.

CHEESE

Cheese is the curd of milk, drained, salted and pressed. Cheese made from unskimmed milk is about one-half fat, the fat globules being entangled in the curd. Skimmed milk cheese is sometimes "filled" by having lard or other cheap fat added to it. "Filled" cheese is greasy when warm, has little flavor, and does not keep well.

Food Value of Cheese.—Cheese, like eggs, is a food containing much nourishment in small bulk,—a concentrated food. It should be used more commonly than it is. Also it is a good substitute for meat, macaroni cooked with cheese being hearty enough to form the main dish of a meal. One pound of cheese contains as much nutriment as two pounds of meat. So as far as food value is concerned it is a much cheaper source of nutrition than meat. Unfortunately it is somewhat difficult of digestion, and for this reason should not be eaten by delicate persons or by young children. It is much more easily digested if grated or melted. For healthy people, particularly for men engaged in active work, it is one of the best of foods.

Cheese Relish.

1½ cups cooked rice, ½ cup grated cheese, 1 cup white sauce, 1 cup buttered crumbs.

Cook rice, add to white sauce, add cheese, place in buttered baking dish, cover with crumbs and brown. Two cups cooked cabbage may be used in place of the rice and makes a delicious scallop.

Cheese Sauce on Toast.

2 tbsp. butter, 2 tbsp. flour, ¼ tsp. salt, cayenne, 1 cup milk, 1-3 cup grated cheese.

Make white sauce, add cheese. Stir until melted and serve on toast or wafers.

GET THE WALKING HABIT

(Written Last Fall but still Good)

These are the days to walk. Country roads, wind-swept and dry, or rain-swept and damp, call to you. The nut crop, we hear is a failure, but throwing broken limbs into treetops is just as good exercise as it always was.

Shoe leather, we know, is going up in price; but don't be afraid to wear out your shoes on that account. Long walks in the country, or between your home and your work, or through the park of an evening or a Sunday, form one of the best little insurance policies in the world.

Walking is the best of exercises; every muscle in your body will respond if you swing your arms, fill your lungs and set out for a spot on the far horizon.

Wear out your shoes, then; that's what they're made for—to take the wear that otherwise would scrape and cut your feet. The man or woman who wears out half a dozen pairs of shoes a year, through frequent walking, seldom fills an early grave.

A pair of shoes today is cheaper than a coffin to-morrow—and walking is more fun than lying in a grave.—Patterson (N. J.) Press-Guardian.

Montreal Man Tells Wonderful Story

BAD CASE OF BRIGHT'S DISEASE CURED BY DODD'S KIDNEY PILLS

George Sullivan, Who Suffered From The Dread Disease for Two Years Gives Credit for His Recovery to Dodd's Kidney Pills.

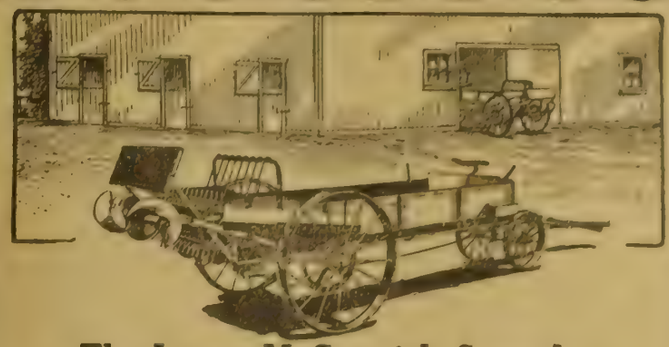
Montreal, Que., March 20th, (Special.)—Completely cured of that most dreaded of all diseases, Bright's Disease of the kidneys, Mr. George Sullivan, 284 de St. Valiers St., this city, is spreading the good news that he found his cure in Dodd's Kidney Pills.

"I suffered from Bright's Disease for two years," Mr. Sullivan states in an interview. "I was unable to work for weeks at a time. I spent hundreds of dollars on doctors without receiving any real benefit and received outdoor treatment at the Montreal General Hospital.

"I was feeling very badly discouraged when a friend advised me to try Dodd's Kidney Pills. After using three boxes I was much better. I kept on till I had used nine boxes, when I was completely cured.

"Naturally I consider Dodd's Kidney Pills a wonderful remedy."

Dodd's Kidney Pills are no cure-all. They cure kidney diseases of all kinds from backache to Bright's Disease. The proof of this is their growing popularity in Canada for over a quarter of a century. If you haven't used them ask your neighbor about them.



The Latest McCormick Spreader

WE now offer to farmers a spreader that makes 20 loads of manure do the work for which 40 used to be required. Besides making this important saving, it is a light draft machine, low, only 43 inches to the top of the box, yet with ample clearance, and it is provided with the most effective wide spreading device.

The spiral you see just behind the beater does the work. It catches the manure just as it comes from the beater, breaks it up into still finer pieces and spreads so much wider than the machine that the rear wheels always travel on uncovered ground when matching the last strip. The spread is even all across, the same in the center as at the edges.

By the use of the **McCormick** spreader, stable manure becomes at once the cheapest and the most effective fertilizer for most soils. The spreader is made in two sizes, No. 5 for small truck farms and No. 6 for large farms.

Send your name and address to the nearest branch house and let us give you the details of this latest and best manure spreader.

Sick Headache and Biliousness

CURED BY

MILBURN'S LAXA-LIVER PILLS.

Mrs. Willard Tower, Hillsboro, N.B., writes: "I have suffered something awful with sick headache. At times I would become bilious, and would have severe pains in my stomach after eating, and have a bad taste in my mouth every morning. I told some of my friends about it and I was advised to use Milburn's Laxa-Liver Pills. This I did and and they cured me."

When the liver becomes sluggish and inactive, the bowels become constipated, the tongue becomes coated, the stomach foul and sick and bilious headaches occur.

Milburn's Laxa-Liver Pills clean the foul coated tongue and stomach and banish the disagreeable headaches.

Milburn's Laxa-Liver Pills are 25c. per vial, 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont

COMMON POISONS AND WHAT TO DO FOR THEM

A poison may be defined as a substance which, when introduced into the system, or applied externally, injures health or destroys life. Poisons may be classed as corrosives, irritants, and neurotics.

The action of poisons is local or remote, or both local and remote. The local actions of a corrosive poison are usually so well marked that they are easily recognized, but the symptoms of mineral irritant poisoning so closely resemble those of natural diseases as to render the diagnosis a matter of great difficulty.

The following are the most common of the corrosive poisons: the mineral acids—sulphuric, nitric, hydrochloride, and oxalic; the alkalies—potash, soda, and ammonia acid; and the alkaline and corrosive salts, such as acid sulphate of potassium, carbonate of potassium, chloride of zinc, tin, antimony, and nitrate of lsiver.

The action of the corrosive poisons is purely local. The symptoms are marked and unmistakable. After the corrosive substance has been swallowed a burning sensation is felt in the mouth, gullet and stomach, and this sensation rapidly extends over the whole abdominal region. This sensation is followed by vomiting, which gradually increases in severity. The mouth and tongue exhibit local egects of the corrosive. There is marked thirst, a shortness of breath, rapidly bounding pulse, and profuse cold perspiration. The intellect is usually clear until death.

In treating corrosive poisons the use of a stomach pump should be avoided, as there is always danger of perforating or puncturing the walls of the stomach. A soft stomach tube may be used with safety. Until the doctor comes the corrosive poison may be neutralized by giving lime water or, better still if it is at hand, saccharated lime water, or very weak solutions of caustic alkalines, or very frequent doses of chalk whiting. If it is the caustic alkalines which have caused the trouble, give large drinks of very weak acid solutions.

The following are some of the symptoms and remedies for specific poisons of the corrosive group: Carbolic acid (creosote) causes pain in the stomach, whitening of the lips and mouth, stupor and heavy breath, and narrowing of the pupils of the eyes. For carbolic acid poisoning give epsom salts in warm water. Later give oil of some kind, or milk, and strong cogee or tea. Apply hot blankets and hot water bottles to the feet and legs. Oxalic acid (so-called acid of sugar) causes burning pains in the stomach, intense vomiting, cold perspiration, and convulsions. Give chalk, lime water, gruel or linseed tea. Give strong coffee or other stimulants. With hydrocyanic acid death is usually so rapid that nothing can be done. The most hopeful things to do are to use artificial respiration, and to make hot or cold applications to the face and chest. Poisoning by caustic alkalies and carbonates is rare, but in case of such poisoning give vinegar and water and later milk and arrow root.

Irritant Poisons

Irritant poisons are of three classes—metallic, vegetable, and animal irritants. Symptoms usually develop more slowly than with the corrosive poisons. Sometime after the irritant has been swallowed—length of the time depending upon the specific character of the poison—burning pain develops and constriction of the mouth and throat and gullet. This is followed speedily by sharp, burning pains in the upper part of the abdomen, nausea, vomiting, thirst, rapid and feeble pulse, collapse, convulsions, and unconsciousness. These symptoms are sometimes confused with those of gastritis, severe colic, rupture of the stomach or intestines, or peritonitis.

The metallic irritant poisons which are most common are copper sulphate (blue vitriol or blue-stone), lead acetate (sugar of lead), corrosive sublimate (mercuric chlorid or bichlorid of mercury), arsenic (Paris green), and phosphorus (matches and rat poisons).

The symptom of blue vitriol poisoning is pain in the upper part of the abdomen. Give white of eggs and milk. Sugar of lead poisoning may be known by constriction in the throat and crampy pains in the stomach. Give an emetic; epsom salts in warm water. Corrosive submlimate poisoning produces an acid metallic taste and sets up a burning heat in the throat and stomach. Give white of egg. Later give strong coffee or tea and apply hot water bottles and hot blankets. Arsenic poisoning causes faintness, nausea, burning pains in the upper part of the abdomen, and headache in the fore part of the head. Give an emetic, soap and water; white of eggs and castor oil. Phosphorous gives a garlic smell to the breath and causes prostration. Give an emetic, such as epsom salts, and strong stimulants.

A common vegetable irritant is croton oil, which causes pain in the stomach, vomiting, and diarrhea. Give an emetic, brandy and the white of eggs.

For poisoning by some of the animal irritants, such as Spanish fly, hair lotions and blistering fluids, give emetic, white of eggs, milk and gruel. Avoid oil for these poisons. The symptoms are an acid taste, vomiting, and purging.

Neurotic Poisons

rb gb am co mfl olz er u(g crn rf

Under the heading of neurotic poisons may be ranged a great number of poisons producing symptoms which have this in common. They are more or less prominently associated with the nervous system. Neurotic poisons include the pure narcotics, such as opium and morphine, and numerous other poisons such as chloroform, strychnine, aconite, belladonna, alcohol, phenol, etc. The symptoms of these poisons necessarily are of the most varied character.

Of these poisons, opium is the most common, and may come from laudanum, paregoric, or soothing syrups. Opium produces a period of excitement, followed by deep sleep, with slow, heavy breathing, contracted pupils, clammy perspiring skin, with all other secretions of the body more or less suppressed. For this poisoning give an emetic and apply ammonia to the nostrils. As soon as the emetic acts well, give black coffee and produce artificial respiration. Keep the patient awake. Force him to walk and keep him from being quiet.

Belladonna causes a flushed face, burning skin, delirium, thirst, dilated pupils, rapid pulse, and quick breathing. Give emetics, such as castor oil,

PEERLESS PERFECTION
Absolute Security
WHEN you go away for a day or turn in for the night, you are certain your stock is locked in—they can't get over, under or through the spaces—a perfect fence for hilly or uneven ground, through streams; protects poultry, ducks, geese, sheep and hogs. Can't sag or break down and will turn an unruly horse
Peerless Perfection Fencing
is made of best heavy Open Hearth steel fence wire, the impurities burned out and all the strength and toughness left in. Makes the fence elastic and springy. It will not snap or break under sudden shocks or quick atmospheric changes. Our method of galvanizing prevents rust and the coating will not flake, peel or chip off. Every intersection is securely clamped with the famous Peerless Lock.
Send for catalog. It also describes our farm gates, poultry fencing and ornamental fencing.

Let Him Help Himself To
CROWN BRAND
CORN PURE SYRUP
IT will do more than satisfy his craving for "something sweet"—it will supply the food elements needed to build up his little body and help him to gain in health and strength.
"Crown Brand" is a wholesome, nourishing food—as well as the most delicious of table syrups.
The recipes in our new book, "Desserts and Candies", will tell you just how to use it, in many novel ways. Write for a copy to our Montreal Office.
Dealers everywhere have "Crown Brand" in 2, 5, 10 and 20 pound tins—and 3 pound glass jars.
EDWARDSBURG
CORN SYRUP
THE CANADA STARCH CO. LIMITED
MONTREAL, CARDINAL, BRANTFORD, FORT WILLIAM.
Makers of "Lily White" Corn Syrup, Benson's Corn Starch and "Silver Gloss" Laundry Starch.
222

and strong coffee.

Chloroform poisoning may be detected from the breath of the patient. The pulse will be feeble, pupils large, and the breathing difficult. If the chloroform has been swallowed, give an emetic, and as soon as it has acted, baking soda in water. Practice artificial breathing. When the doctor arrives, electricity may be employed to keep breathing going.

Strychnine causes convulsive spasms with arching of the spine, difficult breathing, and feeble pulse. Give emetics. Chloroform may be freely inhaled to allay the spasmotic contractions of the muscles. Above all, the patient must be kept warm and quiet.

Spotted hemlock (a common wayside plant) is another neurotic poison which may cause death unless action is speedy. It causes headache, vomiting, purging, feeble and irregular pulse, delirium, sweats, and convulsions. Give emetics, strong tea in quantities and other stimulants. Keep the patient warm and practice artificial breathing.

Act Quickly

All the directions for treating the various kinds of poisoning may be summed up in these few simple rules:

1—Get rid of the poison
2—Stop its action
3—Remedy the mischief it has done
4—Fight against the tendency to death.

Never wait for a remedy, however perfect, if any imperfect remedy is at hand. That remedy is best which is the readiest. The grand rule to follow in case of poisoning is—lose no time.

TO CLEAN SILVER

Put four quarts of boiling water in an agate pan and place on the stove. Put a small piece each of zinc and aluminum in the water. Use an old Mason fruit-jar cover and an old aluminum drinking-cup. Add two tablespoonfuls of salt and one tablespoonful of baking-soda. Put in the silver to be cleaned and let it remain from three to five minutes, or until it looks bright, then take it out and wash in hot, soapy water, and dry. Your silver will look like new.

This is especially good for engraved silver, as it cleans all the little places much better than a polish, and does not in any way injure the silver. This should not be used on plated ware.

SUCCESS WITH BEGONIAS

Set the begonia in a box or pot filled with rich soil and sand mixed, putting gravel and charcoal at the bottom. Water freely to make nice thrifty plants. Keep in a warm, partially shady situation, on an east or north porch. Never let a begonia set out where beating rains can strike it, as the stalks and leaves are tender and easily broken and the plants do not thrive when not under shelter. In cold weather keep the plant in the house where as even temperature as possible can be had, where it will not get chilled or frozen.

I now have a begonia four years old called "President Carnot," seven feet high, that I have handled as above described. Carefully reset every spring in fresh soil. It is a remarkable strong growing variety, foliage very large, flowers beautiful coral red in large pendant panicles similar to Rubra, but very much larger.—Mrs. W. A. Owen.

MEAT LOAF

Two pounds of lean beef, one-half pound of pork, one tablespoonful of chopped parsley, one-half cup of bread crumbs, one-half cupful of strained tomato, two teaspoonfuls of salt, one-half teaspoonful of onion juice, and one-quarter teaspoonful of pepper. Grind the meat very fine. Add the other ingredients and press into a firm roll. Bake thirty minutes. Have a hot oven to sear the surface, then cook more slowly. Baste with a liquid of one tablespoonful of butter and half a cupful of hot water. Serve with tomato sauce.

A SKIRT RACK

Many readers of the Maritime Farmer who are crowded for closet room may be glad to know of the skirt rack which holds eight skirts and may be attached to the inside of the closet door. This rack is an oblong frame, a little longer than half the length of the door, and a little narrower than the width of the door. In this frame are fastened eight rods. The lower edge of the frame is fastened to the door with hinges, and a cord is attached to the upper end of a pulley fastened near the top and centre of the door, thus making it easy to raise and lower the rack. The rack is dropped to a horizontal position, the skirts are folded and laid over the rods. and the rack is then pulled up against the door.

HINTS FOR HOUSEKEEPING

Ants in the pantry: Spread a thin coating of lard over a plate and set it on shelf near their entrance. Stir it up and spread again the next day.

Ant hills on the lawn: Get a four-ounce bottle of bisulphite carbon, bore holes in and about the hill, pour a few drops into each hole, and cover with earth.

Anaemia

"Only tired."

This is the way anaemic, bloodless people usually describe their condition.

But there is a pallor of the lips, eyelids and gums which denotes the weak, watery state of the blood.

Tired feelings tell of muscular weakness. Failure of the digestive organs indicates their weakened action. The system is running down because the blood is lacking in the nutritive element which is necessary to rebuild the cells wasted by the daily work and in the process of living.

In this weakened condition one is an easy prey to colds and all contagious diseases. The blood must be enriched by such restorative treatment as Dr. Chase's Nerve Food before you can hope to regain strength.

Anaemia does not correct itself, and, consequently, the greatest danger lies in neglecting to take active treatment until the strength is too far wasted.

Many thousands have been cured of anaemia by using Dr. Chase's Nerve Food, and this is the best proof that it will not fail you.

It supplies, in condensed and easily assimilated form, the ingredients from which nature forms rich, red blood. Consequently, the benefits obtained are both thorough and lasting.

50 cents a box, 6 for $2.50, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

Do not be talked into accepting a substitute. Imitations disappoint.

DR. A. W. CHASE'S NERVE FOOD

THE N. B. APPLE PACKING SCHOOL A GRAND SUCCESS

(Continued from page 325)

this evening resolve that we are going to come back in a year's time to a similar meeting and be able to say that our orchards are in better condition and have been better looked after than ever before, and further that we have been able to get one or more of our neighbors interested in the good work.

I trust that the present year may be a very prosperous one for all of you in every respect and particularly in your orchard work.

Improve Fruit Growing

In moving the following resolution, which was adopted unanimously, Mr. Vroom referred to the various steps taken by the Government during the last six years to encourage and improve fruit growing:

Whereas, it is well established that New Brunswick has an abundance of lands well adapted to the successful production of the apple and small fruits and that these lands are favorably situated with respect to transportation and marketing facilities;

And whereas, prior to 1910, the governments of the province had given little or no attention or assistance to fruit growing;

And whereas, the appointment in 1910 of a horticulturist and the building up since that time of the Horticultural Division, with the employment of additional practical demonstrators, the holding of three large apple shows, and other effective steps, all of which were made possible by the voting of efficient appropriations for the encouragement of fruit growing, have given the industry a decided impetus, encouraged the fruit growers in their work, advertised the province's attractive agricultural resources, and in general have placed apple orcharding in this province on a permanent foundation upon which a large and profitable industry may be safely built up;

Therefore resolved, that this meeting or convention of the fruit growers here assembled, representing nine counties of the province, does place itself on record as approving heartily of the assistance and policy for encouragement of fruit growing as carried out by the Government since 1910;

And further resolved, that it respectfully requests and urges upon the Government the advisability and necessity of maintaining the Horticultural Division at its original maximum strength and of continuing, and, if possible, of extending the good work done for the encouragement of fruit growing in New Brunswick.

Immense Possibilities

In speaking to the resolution, Mr. W. W. Hubbard referred to the great possibilities of the province in fruit growing, and pointed out that the three apple shows had been valuable advertisements in showing to the world at large what we have and what we can do in apple production, and generally advertising the attractive agricultural resources of the province.

Mr. S. B. Hatheway said that, as a charter member of the Association, which was formed in 1904, it had been a hard struggle to keep it alive and hold meetings during the first few years, and he was particularly delighted with its growth and progress and the healthy spirit of optimism. He also referred to his own orchard experience and said that growers generally should be first as ready to speak of the practices which they found unsuccessful as well as of their successful ones. He then presented the following resolution:

Whereas, we understand that Mr. George E. Sanders, who for some years past has been in charge of the Brown-Tail Moth campaign and spraying investigation work in Nova Scotia for the Dominion Entomological Branch, has been relieved of the first-named work, and henceforth will devote all his time to spraying experiments for the control of insects, and, incidentally, fungus diseases, in the Maritime Provinces, and that, therefore, he will be able, at least, to carry on some of that work in New Brunswick;

Therefore resolved, that this meeting or convention of the fruit growers here assembled, representing nine counties of the province, does place itself on record as commending the action of the Dominion Entomological Division in taking this step, which makes the carrying on such work in New Brunswick possible.

The resolution was carried.

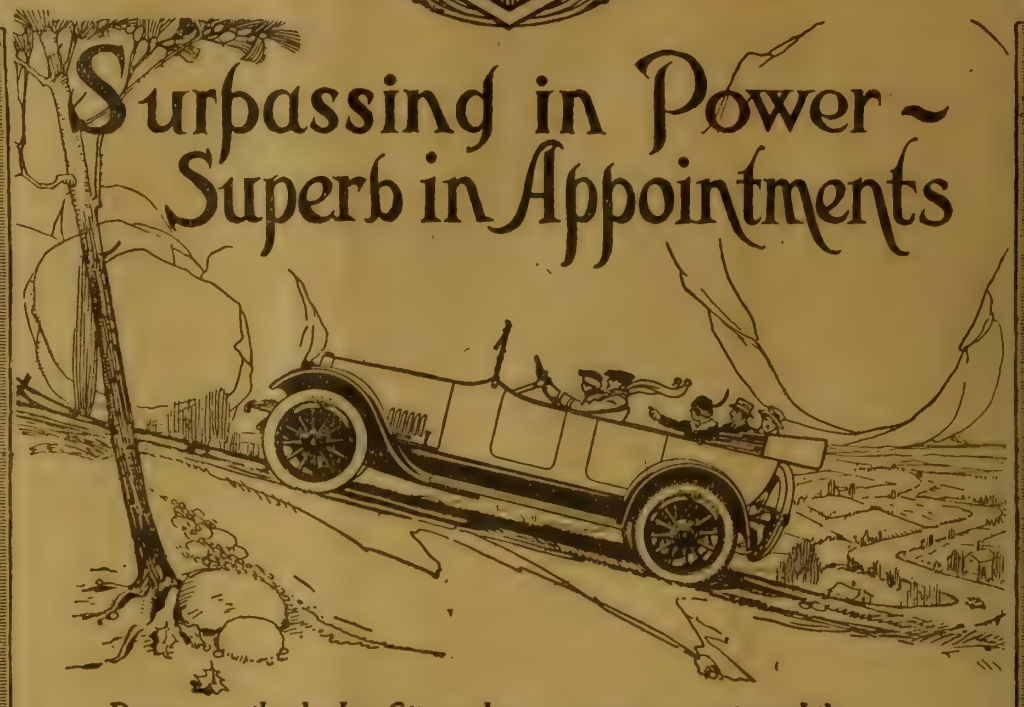
Mr. J. B. Daggett, Secretary for Agriculture, in a strong address, emphasized the value of co-operation and the importance of quality in all our work. Mr. Daggett also referred to the advertising value of the apples sent over to the London office. He thought there was a great future for the apple industry in this province and concluded by expressing his faith in New Brunswick and wishing the fruit growers a high measure of success in their work.

Show Appreciation

The following resolutions, which were unanimously adopted, were presented respectively by A. R. Gorham, of Grey's Mills, and Mr. R. A. Fillmore:

McLAUGHLIN

Surpassing in Power ~ Superb in Appointments



Power, or the lack of it, makes or mars an automobile.
Power gives satisfaction, the lack of it, annoyance.
Canadian hills and highways are easily negotiated on high gear with the reserve power of the McLaughlin valve-in-head motor. This is due to the Valve-in-head principle of the McLaughlin motor construction, which develops from 15 to 25% more power than motors of other type of the same bore and stroke.
In all the essential qualities of a good motor car—body construction, mechanical efficiency and appointments—the McLaughlin is equal to the best. In power it stands alone.
The New Series McLaughlin cars include 4 and 6 cylinder models in Touring, Roadster and Sedan types, at prices ranging from $895 to $2350; a new 60 H. P. 6 cylinder 7 passenger McLaughlin at $1900.
Send for our new catalogue "B" describing our complete line to

THE SMITH FOUNDRY CO., Ltd., Fredericton, N. B.

Resolved, that we, the students in attendance at the Apple Packing School now being held by the New Brunswick Department of Agriculture, do hereby express our appreciation of the services of Messrs. P. J. Carey and George H. Vroom, of the Fruit Commissioner's Branch, and Messrs. George E. Sanders and A. G. Duston, of the Dominion Entomological Division, and forthwith tender our thanks to these gentlemen, and the chiefs of their division.

Resolved, that we, the students in attendance at the Apple Packing School now being held by the Provincial Department of Agriculture, do hereby express our appreciation of the opportunity thus acorded to gain valuable and needed information re the spraying, packing and marketing of our apples, and that we commend the action of the Department in organizing and holding such a school, and also our appreciation of the energy and ability of the Provincial Horticulturist as displayed in the great advance which has been made in the fruit industry of the province in recent years.

Leading Fruit Province

Geo. H. Vroom, Chief Fruit Inspector for the Maritime Provinces, said that years ago he had been ridiculed for stating in other provinces that he believed the time would come when New Brunswick would be one of the leading fruit growing provinces of the Dominion—but those same people now had to admit that his prediction would surely be realized. He had always had great faith in our apple producing possibilities, and had been very glad to do anything he had done to help the industry along in New Brunswick.

P. J. Carey, Chief Packing Expert of the Federal Fruit Division, said that although he had held apple packing schools in British Columbia, Ontario and Nova Scotia, this was the best school he had ever had charge of, the attendance was the largest and the interest and eagerness for information was very satisfactory indeed. He thought that New Brunswick was fortunate in getting a proper start and mastering the packing part of the business before the produce to be handled was very large, because in the other provinces they had done the opposite—got the large crops first and only lately had learnt to pack rightly, and so in that way they had had a tremendous obstacle to overcome, but New Brunswick was profiting by the lesson and avoiding that big mistake.

Mr. Geo. E. Sanders, of the Dominion Entomological Division, referred to some of the experimental work for the control of insect and fungus enemies of the apple which they had done in Nova Scotia, and to the fact that he was going to take up similar work in New Brunswick this present year. He invited the co-operation of the growers in successfully working out the spraying problems in New Brunswick orchards.

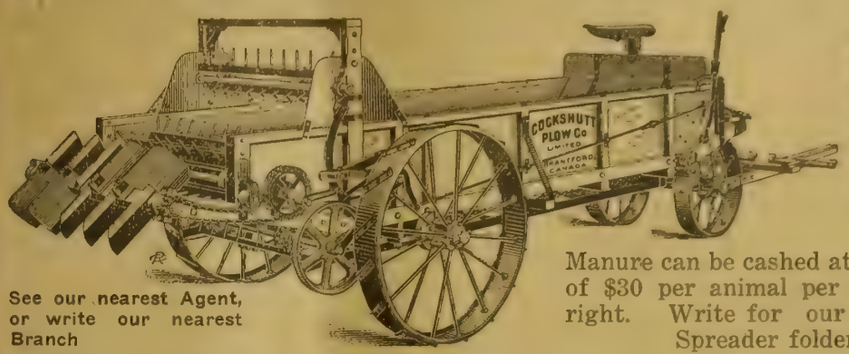
Mr. W. W. Hubbard then invited any of those attending the course, who cared to do so, to come down in the morning to the Experimental Station and he would only be too glad to show them the barns, equipment and livestock, and make their visit as interesting and profitable as possible.

The most successful meeting ever held by the fruit growers of the province was then closed by singing the National Anthem.

Cockshutt Manure Spreader

—HEAD AND SHOULDERS OVER THE COMMON RUN—THIS SPLENDID MACHINE PUTS MONEY IN YOUR POCKET EVERY DAY IT'S USED—IN SAVED LABOR, IN BETTER DISTRIBUTION AND IN BIGGER, STRONGER CROPS

The Cockshutt ideals—simplicity, light-draft and super-efficiency are fully worked out in this Spreader. "Spreader"—that's the word—not a mere "dumper!" Our idea of a Manure Spreader is one that thoroughly carpets the roughest field and leaves man and horses unwearied at the day's end. And we've got it. The revolving spike-studded delivery cylinders are fine but we go further—a special Distributing Paddle pulverizes and DISTRIBUTES the manure in a very thorough way. Strong, direct chain drive—no bothersome gears or clutches; the driving and conveyor chains are extra heavy and strong, for years of hardest service; easily-oiled bearings and big wide-tired wheels make light draft; the box is specially low for easy loading.



When not spreading, the machinery is not running—a handy lever does the trick. Flow of manure can be changed in a second, and it's absolutely independent on hillsides, ruts, etc.

See our nearest Agent, or write our nearest Branch

Manure can be cashed at the rate, at least, of $30 per animal per year, if it's used right. Write for our newest Manure Spreader folder at once

Truro ST. JOHN, N. B. Charlottetown

Pull Stumps The Easy, Practical Way

CLEAR your land by the KIRSTIN Method, the quick, easy, sensible, economical way—the way that has proven practical under all conditions. One man handles and operates the KIRSTIN One-Man Puller—no horses required. The improved Double Leverage KIRSTIN—the new short lever Model stands the extreme test of the very hardest stump-pulling. The KIRSTIN wonderful compound leverage principle makes any man master of tough stumps anywhere. In addition to its practically unlimited power, the KIRSTIN changes speed while pulling a stump. No other Stump Puller at any price contains a similar device—no need to plug along at the same speed after the stump begins to come.

When the hard pulling is over and the stump begins to come, shift to high-speed and hasten the pulling. Clears over an acre from one anchor—no time lost in resetting the machine, just a steady, easy back and forth movement of the lever pulls out stump quick and easy. Pulls small trees, hedges and brush in bunches.

Kirstin
Stump Pullers
Made in Canada

The KIRSTIN gives unlimited power. The low price puts the KIRSTIN within reach of all. Ten day try-out on your farm — Special Profit-Sharing Offer to the first buyers in each neighbourhood.

A 21,000-POUND AYRSHIRE

It will be welcome news to Ayrshire men that a new record has been made in the Canadian Ayrshire world, by the cow "Grandview Rose"—37030—owned by Shannon Bros., Cloverdale, B.C., that finished her test January 31st last, with 21,423 lbs. milk and 900 lbs. fat, and is due to freshen early in April, this is equal to 1,050 lbs. of butter. Her age at commencement of test was five years and twenty-two days.

This cow was bred by the Messrs. Shannon Bros., her sire being Springhill Live Wire—27778—by Lessnessock Durward Lely (imp.)—24758—(6746). Her dam was Auchenbrain May (imp.)—27779—by Auchenbrain Crusader (6807). It will be seen that this cow's breeding is backed up by blood from the most productive strains in Scotland.

Grandview Rose is a large cow and true to Ayrshire type and form. The Messrs. Shannon Bros. are to be congratulated on being the first Canadian Ayrshire breeders to breed a cow to pass the 21,000 lb. mark in Record of Performance.

W. F. Stephen, Secretary, Canadian Ayrshire Breeders' Association.

LACKING HORSE SENSE

Very often one sees a horse standing shivering in the cold while its owner is sitting in the house or store beside a warm fire, never thinking about the comfort of the animal patiently waiting outside. A horse will give much better service if it is well cared for and the man who will allow his horse to stand long in the cold without covering or without being fed, should not expect very much from it. It is, no doubt, due more to thoughtlessness than from a real desire to be cruel that some men treat horses in this manner.

WAR LOAN

DOMINION OF CANADA

Issue of $150,000,000 5% Bonds Maturing 1st March, 1937

Payable at par at Ottawa, Halifax, St John, Charlottetown, Montreal, Toronto, Winnipeg, Regina, Calgary, Victoria, and at the Agency of the Bank of Montreal, New York City.

INTEREST PAYABLE HALF-YEARLY, 1st MARCH, 1st SEPTEMBER.

PRINCIPAL AND INTEREST PAYABLE IN GOLD.

ISSUE PRICE 96.

A FULL HALF-YEAR'S INTEREST WILL BE PAID ON 1st SEPTEMBER, 1917.

THE PROCEEDS OF THE LOAN WILL BE USED FOR WAR PURPOSES ONLY.

THE MINISTER OF FINANCE offers herewith, on behalf of the Government, the above-named Bonds for Subscription at 96, payable as follows:—

10 per cent on application;
30 " 16th April, 1917;
30 " 15th May, 1917;
26 " 15th June, 1917.

The total allotment of bonds of this issue will be limited to one hundred and fifty million dollars, exclusive of the amount (if any) paid for by the surrender of bonds as the equivalent of cash under the terms of the War Loan prospectus of 22nd November, 1915.

The instalments may be paid in full on the 16th day of April, 1917, or on any instalment due date thereafter, under discount at the rate of four per cent per annum. All payments are to be made to a chartered bank for the credit of the Minister of Finance. Failure to pay any instalment when due will render previous payments liable to forfeiture and the allotment to cancellation.

Subscriptions, accompanied by a deposit of ten per cent of the amount subscribed, must be forwarded through the medium of a chartered bank. Any branch in Canada of any chartered bank will receive subscriptions and issue provisional receipts.

This loan is authorized under Act of the Parliament of Canada, and both principal and interest will be a charge upon the Consolidated Revenue Fund.

Forms of application may be obtained from any branch in Canada of any chartered bank and at the office of any Assistant Receiver General in Canada.

Subscriptions must be for even hundreds of dollars.

In case of partial allotments the surplus deposit will be applied towards payment of the amount due on the April instalment.

Scrip certificates, non-negotiable or payable to bearer in accordance with the choice of the applicant for registered or bearer bonds, will be issued, after allotment, in exchange for the provisional receipts.

When the scrip certificates have been paid in full and payment endorsed thereon by the bank receiving the money, they may be exchanged for bonds, when prepared, with coupons attached, payable to bearer or registered as to principal, or for fully registered bonds, when prepared, without coupons, in accordance with the application.

Delivery of scrip certificates and of bonds will be made through the chartered banks.

The issue will be exempt from taxes—including any income tax—imposed in pursuance of legislation enacted by the Parliament of Canada.

The bonds with coupons will be issued in denominations of $100, $500, $1,000. Fully registered bonds without coupons will be issued in denominations of $1,000, $5,000 or any authorized multiple of $5,000.

The bonds will be paid at maturity at par at the office of the Minister of Finance and Receiver General at Ottawa, or at the office of the Assistant Receiver General at Halifax, St. John, Charlottetown, Montreal, Toronto, Winnipeg, Regina, Calgary or Victoria, or at the Agency of the Bank of Montreal, New York City.

The interest on the fully registered bonds will be paid by cheque, which will be remitted by post. Interest on bonds with coupons will be paid on surrender of coupons. Both cheques and coupons, at the option of the holder, will be payable free of exchange at any branch in Canada of any chartered bank, or at the Agency of the Bank of Montreal, New York City.

Subject to the payment of twenty-five cents for each new bond issued, holders of fully registered bonds without coupons will have the right to convert into bonds of the denomination of $1,000 with coupons, and holders of bonds with coupons will have the right to convert into fully registered bonds of authorized denominations without coupons at any time on application to the Minister of Finance.

The books of the loan will be kept at the Department of Finance, Ottawa.

Application will be made in due course for the listing of the issue on the Montreal and Toronto Stock Exchanges.

Recognized bond and stock brokers having offices and carrying on business in Canada will be allowed a commission of three-eighths of one per cent on allotments made in respect of applications bearing their stamp, provided, however, that no commission will be allowed in respect of the amount of any allotment paid for by the surrender of bonds issued under the War Loan prospectus of 22nd November, 1915, or in respect of the amount of any allotment paid for by surrender of five per cent debenture stock maturing 1st October, 1919. No commission will be allowed in respect of applications on forms which have not been printed by the King's Printer.

SUBSCRIPTION LISTS WILL CLOSE ON OR BEFORE THE 23rd OF MARCH, 1917.

DEPARTMENT OF FINANCE, OTTAWA, March 12th, 1917.

Volume 22. SUSSEX, NEW BRUNSWICK, APRIL 10, 1917. Number 13.

The Preparation of Land and Cultural Methods For Potatoes.

By W. W. Hubbard, Supt. Experimental Station Fredericton, N. B.

There is perhaps no crop which has a wider range of growth than the common Irish potato, nor one which can be grown under more diverse methods of cultivation.

The potato plant, a native of Central and South America, where it is yet found in its wild and apparently useless state, was first taken to Britain in the reign of Queen Elizabeth, whence it has spread in its improved form over the whole civilized world and become an even more universal food plant than either wheat or rice.

So many and varied are the systems of its cultivation that it is unwise to take up time to describe them. It may be grown from the seed balls, and if the season of growth is sufficiently extended, large edible tubers may be obtained from the planting of these true seeds. The planting of potato seed as we ordinarily use the term, is not seeding at all in a botanical sense, but rather budding or grafting, as the tuber is really not a seed but a portion of the plant endowed with perpetuative powers from the growth of the eyes or buds which occur on these tubers. The new plant resulting therefrom is but a continuation of the original plant in much the same way as the strawberry plant throws our runners which take root and form new plants with the same qualities as the original plant. When this is understood we can realize that the growth of potatoes may take place under conditions quite different from those under which a true seed requires.

A certain amount of warmth, moisture and darkness seem to be the main essentials to the reproduction of tubers, thus considerable quantities may be produced without a seed bed as we understand one at all, the plant seeming to gather the elements necessary for a certain amount of tuber growth, first from the stored up food in the original tuber and then from the air and the decay of the covering material. If a large crop is expected, however, it seems essential for the roots of the potato plant to drink its nourishment through its roots from the food solvent in the soil.

No doubt some growers present have seen the potato beds which used to be quite common along the sea shores, where potatoes are planted on top of the ground covered with seaweed, sometimes with a little soil thrown over this and sometimes without soil. The same results can be obtained by covering potatoes with straw, and I have seen excellent crops taken up in the fall with the use of straw and without any cultivation whatever. I have also seen large crops of potatoes grown by making deep drills in dry ground in August and September and after tramping these drills full of straw and wild hay, splitting the ridges with a double mould board plough, allowing the ground to remain in this condition until the following spring, and then simply planting the potatoes by making a hole down into the straw or hay with a stick, dropping in the seed and filling the hole above the seed with the planters foot. Down on the Magaguadavic River in York County, I have seen crops grown continuously by this method without, I was informed, the addition of any fertilizer whatever, and if my information was correct, a yield of one hundred barrels to the acre could be depended upon. The crop I saw myself appeared to be good enough to give this yield.

To come down, however, to the business proposition of growing paying crops of potatoes in New Brunswick, and to keep down this article to a reasonable length, I will not discuss the effects of climate and character of soils on the quantity and quality of crops, except to endorse what is generally understood that we have in this Province, a climate and soils that enable us to grow large crops of tubers of the best edible quality, and with very strong vitality for reproduction purposes. Sufficient moisture, moderate warmth without extreme heat and friable sharp soils seem to be important factors. We have some soils that do not produce the best potatoes, such as heavy looms full of dark vegetable matter, some swamp mud and our rich and low lying alluvial soils. Sandy and gravelly loams and clay loams with friability are most favorable.

Good soil drainage is the first essential in cultivation, then freedom from weeds and lastly the preservation of a good earth mulch during the whole season of growth. This mulch conserves moisture during drought and also prevents too much heat from penetrating the soil.

Opinion is somewhat divided as to whether fall ploughing prepares land better for potatoes than spring ploughing. Probably much depends upon the mechanical condition of the soil. Some very successful growers used to plant potatoes on sod or rather under sod, by dropping the sets in every third furrow and then ploughing them in to a depth of from four to six inches, following level cultivation till the plants were quite large and then hilling only very slightly.

With an old tough sod theoretically, the best results should be obtained by ploughing in July or early August and harrowing it frequently to ensure the decay of the sod before frost, while with a freshly seeded clover sod, best results might be expected by allowing the clover to make a good growth in the spring before turning it under.

Where the three year rotation of potatoes, then grain, seeded to clover and the clover sod always turned under for potatoes is followed, the Specialist in potato growing can usually get the best results, and it will be found that after the clover crop is repeatedly used, less and less fertilizer will be required to produce full crops of potatoes. Clover not only gathers much nitrogen from the air and stores it in its own root and stem structure, but it also opens up the subsoil with its roots making better drainages and drawing up through these roots lime and potash from the area below that reached by the plough.

After several years careful experimenting with the effect of clover upon the fertility of the soil, Dr. F. T. Shutt,, Dominion Chemist, reports that the clover crops including roots, &c., grown by him contained per acre:

Nitrogen from 100 to 150 pounds.

Phosphoric acid, 30 to 45 pounds.

Potash, 85 to 115 pounds.

This could be put into the soil by ploughing in the full crop. When a crop is taken off and a heavy second growth is ploughed in, the results would probably equal 75% of this, and if this 2nd crop was allowed to die down and a good growth came on in the spring, no doubt the results would be as good as the above figures.

Potash, 9 pounds.

Therefore the above clover crops were equal in fertilizing value to an application of ten tons of barnyard manure.

Dr. Shutt also conducted experiments in growing potatoes after sowing clover with grain.

After wheat with clover he got 320 bus. potatoes per acre.

After wheat without clover, 280 bus. potatoes per acre.

After oats with clover, 301 bus. potatoes per acre.

After oats without clover, 290 bus. potatoes per acre.

After barley with clover, 330 bus. potatoes per acre.

After barley without clover, 280 bus. potatoes per acre.

The next year a repetition of the experiment gave an average yield after grain with clover of 423 bushels per acre, after grain with clover 391 bushels.

Thus in addition to its value as an aid to the cultivation of the soil, it will be seen clover has great fertilizing powers. Before leaving this phase of the question of cultivation, reference should be made to the value of barnyard manure, for this material not only supplies easily available plant food, but also puts most soil in a better mechanical condition, and certainly in a better bacteriological condition.

Therefore apart altogether from its value as a fertilizer, barnyard manure is of distinct value in cultivation. For a potato crop preferably, barnyard manure should be applied the year previously. This may be done by top dressing on the clover crop, or a grain crop, or if, as is a more or less common practice, the potato crop follows an oat crop grown on sod, an excellent plan is to spread the manure on the stubble plough shallow and then cultivate thoroughly with a disc harrow and before freezing up, ridge the land with a double mould board plough or a machine made for the purpose, that will throw up three ridges at once. This saves the manure from leaching and the fine soil from washing as the fall, winter and spring precipitation will settle between the ridges and soak off into the subsoil, without passing through the soil in the ridges. The frost will also have a more thorough action on both the surface soil and the subsoil, the land will dry out more quickly and therefore warm up earlier in the spring, and when these ridges are harrowed down, will leave the soil in ideal condition for the potato crop or in fact any crop.

Planting

In commercial potato growing, hand planting is practically a thing of the past. Most horse planters will do the work, quickly, economically and well, and they have the added advantage of applying any commercial fertilizer used at the same time. The depth of planting may be regulated to suit the grower, though most growers usually set the planter to drop the seed not more than two inches below the surface of the ground. This means that after cultivation must provide for hilling up the potatoes. Whether or not potatoes should be planted deeper than two inches, depends largely on the soil and subsoil and the season. On very light, dry land, and in dry seasons, it would be reasonable to expect best results from deep planting. In the Ottawa Valley and many parts of Ontario, deep planting and level cultivation are largely followed, while in New Brunswick we nearly always plant on or near the surface, and hill the potatoes.

I have not by me any figures as to the relative merits of the two systems, except in regard to the work done at Fredericton the past season:—

(Continued on page 355)

Agriculture and Live Stock in New Brunswick.

By J. W. Mitchell

We are told that Lord Bacon, who lived about three hundred years ago, undertook the study of agriculture, and that, after reading all the books he could secure bearing upon the subject, he ordered his servant to collect and burn them, since none of them threw any light upon the science or underlying principles of agriculture.

True, we are still in the dark upon many points, but we have travelled a long way since then, and were Bacon with us now there are many good works on the various phases of agriculture which he would not order destroyed.

Some Principles.

Through patient study and research, different branches of science bearing upon agriculture have been evolved and developed and applied to our every-day practices, to such an extent that the agriculture of to-day may be truly said to be an applied science: and by the term "science" we do not mean anything mysterious, but simply exact knowledge arranged in some kind of system or order, so as to connect up cause and effect, or to explain the why of things, and enable us to make progress and do our work intelligently.

Let us give a few examples. Botany and other branches of science, backed by experience in practical agriculture, tell us what we find in plants, how plants grow, and how and where they secure their food,—whether, like grain crops, they draw heavily upon the soil for their food, like corn, they feed heavily upon material supplied them by the air, or, like clovers, they are actual soil builders,—and thus we are enabled to rotate our crops intelligently.

Without the aid of chemistry many of our problems would remain unsolved. For example, it enables us to ascertain the value of manures, solid and liquid, to make up and determine the value of commercial fertilizers, to correct defects in soil, etc. Again, a study of the composition of foods, of their digestible nutriments and of the requirements of the different kinds of animals kept on the farm, both enables us to feed economically and gives us a clue as to the classes of foods to grow.

Bacterioligy has thrown a flood of light upon and greatly helped in the development of modern agriculture. It has taught us that bacteria manufacture plant food from materials too simple for the plant to use direct; that the clovers, aided by bacteria, utilize the nitrogen of the air and build up nitrogen compounds; that many of the important changes that take place in the soil are due to the action of bacteria; that barnyard manure serves a triple purpose, in that it supplies plant food and humus and useful bacteria; and, above all, it has shown that bacteria and allied simple forms of life are Nature's great scavengers, that is, their great function is to decompose dead organic matter,—dead plants, the excrement of animals, sod that is ploughed down, etc., and turn it into earth to again be used as plant food.

Thus there is a cycle in Nature. The plant builds up its material from the air and the soil; the animal builds its material from the plant; then bacteria decompose dead organic matter,—animal and plant,—and convert it into plant food again.

In order to farm successfully the cycle must be completed, that is, we must rotate our crops and keep stock.

Mixed Farming.

Our land will produce in proportion to its state of fertility and no form of farming can be called complete unless it makes provision for keeping the soil in a high state of fertility, that is, unless it enables us to complete the cycle.

In his work, "Wealth of Nations," Adam Smith truly says,

"The increase of stock and the improvement of the land are two events that must go hand in hand, and of which the one can nowhere much outrun the other."

Keeping stock enables us to return to the soil, in the form of solid and liquid manure, much of what was taken from it by the crops grown. Again, the keeping of stock enables us to rotate our crops as a further means of maintaining soil fertility; yea, it forces us into the adoption of such a form of crop rotation as is best for the soil, if we are to feed our stock economically and to the best advantage.

A country that has the conditions for the production of animals and animal products successfully, can count itself blessed. Such is New Brunswick.

(1) It is well watered.

(2) It has the soil and the climate for the growing of summer and winter foods in abundance.

(3) It is favorably situated as to markets, both home and export.

A number of years ago, when the possibilities in agriculture were not nearly what they are to-day, one of the greatest English experts was asked to investigate and report upon the possibilities of New Brunswick along agricultural lines. In his report he tells us that the province has about 18,000,000 acres of land, of which 13,000,000 acres are arable; that it is capable of keeping 450,000 horses, or about seven times the number now kept; 1,800,000 cattle, or above seven times the present number; and 3,750,000 sheep and swine, or about sixteen times the number at present in the province; and that under this higher form of farming it is capable of caring for a population of over four million people, which is about twelve times our present population, or considerably more than half the present population of all Canada.

Of course it is not likely that we would care to denude our forest area to the extent indicated, or be justified in doing so, but, were we to even double or treble the number of live-stock kept and improve their quality, what a boon it would be to the province.

Let me ask this pertinent question: To what class of farmer are the banks most ready to loan money, and why? Is it not the farmer who keeps live-stock and is it not because this is the highest, safest, most profitable form of farming, when taken over a period of years?

New Brunswick is naturally a stock country and it is largely in mixed farming and the keeping of stock that our great possibilities in agriculture lie.

Our Live-Stock Industry.

Now I would turn and deal directly, though of necessity briefly, with some phases of the live-stock industry. Some things said will deal with farm and community practice, while others will have to do with the cooperation of the Department of Agriculture with the farmers in their work. Wherever my remarks imply the adoption of a policy, you will understand that they are only suggestive and for your consideration.

When going into the keeping of live-stock, we should carefully consider the kinds and breeds of stock to keep, from both the productive standpoint and that of markets. Fortunately, in this province we can, from both standpoints, keep a variety of stock,—horses, cattle, sheep and swine.

While we should aim to keep the breeds of stock most suitable to our conditions, this does not mean the keeping of stock that will withstand the most hardship, but rather those that will give the best returns under right conditions as to care and feeding. All of our domestic animals are artificial and specialized and call for good care and feeding, and, if well selected and cared for, will give large returns, but only if given such conditions.

A basic principle in connection with live-stock and dairying is to know the requirement of the animals kept and to satisfy these fully and, at the same time, as economically as possible. Most of what we feed should be produced on the farm; hence our animal and field husbandry should be made to dove-tail into each other. Under present conditions, for example, the expensive grain portion of the rations fed our dairy cows for winter milk production is purchased in the form of by-products of the mill and some of our dairymen might almost as well be living in town. This can and should be greatly remedied. I shall deal with this point in one of my lectures during the course.

We should, I believe, adopt community breeding for both pure-bred and grade stock, in as large a measure as possible, always using, of course, a pure-bred male of outstanding merit. An Agricultural Society should not be bonused on more than two breeds of cattle. The advantages of community breeding are obvious and need not be dwelt upon.

Sliding Scale in Bonusing

Before the purchase of a pure-bred bull is made by an Agricultural Society, a representative of the Department of Agriculture should meet the Society and ascertain whether the aim is to go into beef or dairying. If the latter, a good sire from one of the dairy breeds should be purchased and one breed, if possible, should be adhered to.

The bonus, I am strongly persuaded, should be on a sliding scale, depending upon the individual merits of the animal and the extent to which he is backed by records of performance. This might be discussed during the course.

Dairying

To make any headway in dairying, we must study how to produce the raw material economically. Cow testing, selection, weeding, breeding, the growing of suitable summer and winter foods and proper care are factors that must all be carefully considered.

As to the handling of the milk and cream, a portion of this will naturally find its way to the towns and cities to be consumed as such or made into ice-cream. Outside of this, I am strongly in favor of cooperative or factory dairying, which means less drudgery on the farm, proper equipment, skilled labor, a reduction in the cost of manufacturing, a large quantity of product of uniform and superior quality, better marketing facilities and better prices, all of which spells greater profit. In some cases, particularly in isolated districts, the cheese factory will prove most suitable; but too small an output means a poorly equipped, poorly manned factory, a high manufacturing cost and the possibility of an inferior product. Where practicable, I am in favor of the establishment of a central cream-gathering creamery at a good railway point. Such will serve a large territory and its advantages readily suggest themselves.

As to what the policy of the Department will be in the way of bonusing factories, I am not prepared to say. Its attitude will, undoubtedly, be sympathetic and there will be a desire to help.

Swine.

The swine industry is one that is in great need of development.

Just a few years ago the value of the annual importation of pork products into St. John from outside the province was over $500,000. What it is at present I am not prepared to say.

I believe we should have access to a good abattoir at a central point, to which our hogs could be shipped on foot.

Sheep.

Those who attended the annual convention of the Farmers' and Dairymen's Association in Fredericton, a little over a month ago, will remember that the development of the sheep industry was a live subject. While its possibilities are admittedly great, it is just in its infancy and should be carefully fostered. The dog menace has been blamed as one of the chief obstacles to its development and at the convention referred to this was fully dealt with in discussion and by resolution. It is to be hoped that this is not the last to be heard of this resolution.

It is my intention to secure, through the assistance of the Agricultural Societies, lists of ewe lambs for sale, and to furnish these to parties desirous of purchasing such lambs. If many of these could be sold for breeding purposes, instead of going to market to be slaughtered, it should help to develop the sheep industry.

Also, I hope to secure a fairly complete list of pure-bred stock in the province for sale and furnish information to intending purchasers.

There are now two Wool Growers' Associations in the province and I hope, through cooperation with the Diminion Live-stock Branch, to get others established.

While I have limited my remarks to mixed farming, in the usual sense of the term, with particular reference to the live-stock end of it, I would, before concluding, take the opportunity to widen the application of the term "mixed farming" to meet our conditions. New Brunswick has gone far enough to prove its great possibilities in the production of fruit, particularly apples, and the growing of potatoes, and these are phases of our activities that should receive every encouragement. Again, although I have strong faith in crop rotation and the keeping of stock as the two great means for the maintenance of soil fertility, yet I am not disposed to in any way disparage the judicious use of commercial fertilizers, where such is warranted.

If we balance our farming so as to include crop rotation and obtain larger yields per acre, and secure an increase in and the improvement of our live-stock, the adoption of such specialties as fruit and potato growing, the proper preparation of our products for the market and the marketing of our products under better conditions, there is a bright future in store for us.

If you would like to secure subscribers for us, we can offer you a paying proposition that will assist you to make good use of any spare time you can devote to the work.

Maintaning the Health of the Dairy Herd

By W. M. Lea, M.P.P.

Profit in dairying is generally discussed along the lines of breeding, feeding and weeding. How to breed and raise a dairy herd, feed and care, etc., has been discussed and debated from all angles, but the keeping of a herd in "healthy working" condition is seldom touched upon. Now, I consider one of the hardest problems a dairyman faces is to keep his cows all in proper shape all the year.

I believe any good cow in healthy condition, that does well at calving, will give a profit over cost of feed of from 25 to 60 percent several months. We have learned that one pound of feed is worth as much to this end, before as after calving, in fact, some of the expert feeders claim one pound is worth as much as two pounds after freshening. The discouraging part of dairying and the one that is largely instrumental in curtailing profit, is to have one of the many troubles to happen at calving time, and to see the cow lose the flesh that has cost us so much to put on.

Prevention is better than cure, very many times better, and it is along this line that I endeavour to treat my herd. We should all learn to be observing and notice every time we pass an animal if she is normal in every respect. Living a long distance from veterinarian assistance, I have been forced to treat my own stock to a great extent, and have endeavored to get all the information possible from successful herdsmen and dairyman whom I am privileged to meet from time to time.

We cannot help making mistakes, but we should endeavour not to commit a similar error the second time. I will touch briefly on some of the most common ailments met with in a dairy herd, and my own method of prevention and treatment of same. I will begin with the heifer or cow at or approaching calving.

The most common trouble met with at this time is retention of the afterbirth, mal presentation of the fetus, (or a wrong presentation of the calf at birth), milk fever, garget and inflamation of the udder.

It is always well if possible, to be with a heifer at first calving, and if the season is cold and the stock is in the stable, we leave the cow in her stall during the birth of the calf, as the stable is usually warmer than a box stall and the cow cannot get in any awkward position, which will obstruct the free delivery of the calf. While it is sometimes necessary to render assistance to heifers, great injury is often done at this time by too early interference. Nature can do more to relieve the mother than we can, and time should be given to allow the bones to stretch, and the neck of the womb to open. It is wise to examine and learn if conditions are normal, but do not be to ready to pull the calf away. After several hours, if you find assistance necessary, apply gentle force. Pull only when the birth pains come on and directly towards the cows hind feet. A calf is delivered almost in a circle and a straight pull is hard on both offspring and dam. If, as sometimes happens, the calf is coming backwards, do not attempt to turn it, as it will come almost as well that way.

When the calf is born, or even before, blanket the cow warmly, and if you fear, for any reason, she may retain the afterbirth, apply hot salt over her back, keep her warm and give her drinks as hot as she will take them. Cold does more to prevent a cow cleaning than any cause I know. Excitement is also often responsible for it, but if the cow calves naturally and is kept warm and quiet, she will generally clean within a few hours.

"Milk Fever" that used to be the terror and dread of dairymen, is now easily, and generally successfully, treated by a system known as the oxygen treatment. A proper milk fever outfit consists of an air pump that forces air into the udder through cotton wool or other absorbent saturated with oxygen, but an ordinary bicycle pump can be made to answer this purpose almost as well, there being enough oxygen in the air to kill the germs causing the trouble. However, prevention is much better than the risk of any after treatment, and is generally all that is necessary. Heifers are never known to have this trouble, but heavy milking cows in high condition should be handled carefully. It is generally considered that milking out a full udder shortly after calving is the chief cause of this sickness. Under natural conditions at calving, where a cow is fevered and sick, the calf only takes a little milk and the cow is not called upon to renew any large quantity. We must also remember that the modern cow has been bred to give a much greater quantity of milk than nature intended necessary to support her offspring, and if we draw off a large pail full at this time, we stimulate her system to renew this great quantity, at a time when she should be resting. This overwork, that we often ignorantly force upon her, with the erroreour idea that we are relieving her, is what generally causes an attack of milk fever; however, cases have frequently been know where every precaution possible was taken, when any symptoms of paralysis develop, such as trouble in rising, a glassy appearance of the eye, or loss of control of the head, do not pour any medicine into her, for in a well developed case the throat may be paralysed and she cannot swallow. Many cows have been chocked by this treatment. Milk out the udder, and if a veterinary surgeon is not available, insert a teat tube to which attach a bicycle pump and pump each quarter up tight and hard, and in an hour or so, if she does not arise, repeat the treatment. This has revived cows that were so far gone that the eye would not blink when a finger was pressed into it.

But of all ailments to which a stable fed dairy cow is subject, "Indigestion" is the one most often met. In fact, I think probably, nine times out of ten, when we find a cow refusing feed or showing any symptoms of sickness, it can be traced to some form of indigestion. If the trouble is located in the first stomach or paunch, which is the one most often affected, the symptoms are easily detected. The animal will refuse food, will be bloated more or less (according to the severity of the case) and generally make a peculiar grunt in breathing. She will sometimes take spells of shivering and move stiff and slowly when walking. In other cases the bloating may be so slight as to be hardly noticeable and the animal shows no other symptoms than to refuse food and drink, and people are often led to think the trouble is some form of inflammation.

A dairyman should always keep a good supply of Epsom salts, raw linseed oil, spirits of turpentine and sweet spirits of Nitre on hand. When ever a cow is noticed to refuse feed or is indifferent about eating, even if no other symptoms appear, give one pound of Epsom salts. This will probably head off more serious trouble for you later. But when we meet a well developed case of indigestion, or impaction, to a large cow, give two pounds of salts and eight to ten tablespoonfuls of turpentine and the same of sweet nitre, if you have it on hand. Do all you can to warm the animal up. In fact, success largely

(Continued on page 376)

She's a Winner!

The new Gray-Dort has swept the country. After a winter in the hands of some of the most experienced of Canadian motorists, she has an enthusiastic army of followers.

She's THERE—there with the speed, the power, the comfort. She's economical, too.

She goes over hills like a bird—she pulls through sand and mud like a bull. She's as easy to ride in as a palace steamer. And her bills for gas and tires are easy on your mind.

"The Quality Goes Clear Through"

She's a winner from the drop of the bat.

Every Requirement Met

SPECIFICATIONS

MOTOR—4-cylinder, L-head type, bore 3¼ in., stroke 5 in., horsepower 28. Cast-iron removable heads. Carter carburetor. Thermo-syphon cooling. Westinghouse two-unit starting and lighting system. Connecticut battery ignition. Three speed and reverse selective transmission, with double row New Departure bearings. Gasoline tank under cowl. I beam heavy duty front axle. ¾-floating rear axle, with Hyatt High Duty bearings. 10-in. internal expanding and external contracting brakes. Springs—front 37 in. elliptic, rear 50 in. full cantilever. Left-hand drive. Detroit demountable rims. 30x3½ Dominion tires. Nobby tread rear. Westinghouse electric lighting. Linoleum covered runningboard. Lock ignition switch. Dashlight, ammeter, roberail, footrail, clear-vision windshield, one-man top, tools, equipment complete.

5 passenger touring model $910

3 passenger roadster model $910

Gray-Dort Motors, Ltd., Chatham, Ont.

American Factory at Flint, Mich.

Are you in a hurry? Right under your foot in the Gray-Dort is more speed than you'll care to use. Are you touring a thousand miles? The extra long springs and deep-cushioned upholstery will bring you through fresh as a daisy—without fatigue. And *p-o-w-e-r!* Etienne Planche built the Pugeot. Then he built the Gray-Dort. And Planche says the Gray-Dort is the greatest motor he ever saw.

DATES OF ISSUE.

April 10-24
May 8-29
June 12-26

Farm efficiency begins in the home.

* * *

Honesty is one of the first qualifications of a successful and prolonged business life.

* * *

Co-operation is the only method whereby large combines and organizations can be effectively dealt with.

* * *

A dog, to be of any use to his owner, must be about his owner's business. His value is exactly in proportion as he benefits the owner.

* * *

Raising livestock always produces more wealth in the country. It means greater investment, which in turn brings in greater revenue. When crops are grown and the products sold soil is impoverished and little revenue is received, whereas when these crops are fed to good animals they bring in a great deal more revenue and the soil is improved.

* * *

There is no royal road to success either on the farm or in any other walk of life. Every man is called upon to hew his own way through the almost impenetrable forest known as difficulty, to gather and destroy obstructive refuse while the sweat of labor drips from his weary brow.

The same quality and kind of fence that will keep a sheep-killing dog out of a sheep pasture will keep the same dog confined on his owner's premises. If you have a roving brute, try it.

* * *

The man who strives to secure a little larger income than his neighbor by using a first-class seed, by putting his seed bed in first-class condition, by using registered bulls instead of scrubs, by testing his cows and weeding out the poor ones and by different other things of that nature will easily double the income from his farm.

* * *

FARMING BACKWARDS

Live stock, especially pure bred, is a valuable asset to any farm. The efforts that so many farmers are making to introduce live stock on their farms is most commendable. There is no question as to the profits to be cleared from this branch of farming, provided the farmer sets about his business in a proper manner.

Cattle—dairy or beef—hogs, sheep and, in fact, all live stock, require an abundance of roughage and more or less concentrates for sustenance and growth. The fact that the greater part of the feed for the stock may be grown on the farm, fed and converted into beef, butter, pork, wool and other kindred products, then sold at finished product prices, makes the live stock industry of especial interest and profit to the farmer. If feed for the stock is not grown on the farm and has to be purchased, then a greater or less share of the profits that rightfully should go to the farmer is diverted to other pockets.

On a recent trip we noticed that many farmers in the newer live stock sections had purchased good, well-bred foundation stock of various farm animals. They bought the stock when there was practically nothing on hand, or in the barn to feed them—everything had to be purchased from the miller or feed dealer.

This is going at the proposition backwards, placing the cart before the horse. While there is no question that hogs and cattle are profitable. It does not take them long to eat the profits if there is not a well-filled farm granary and a bulging haymow to supply them. Every farmer can raise all the roughage, and practically all the concentrates needed for balanced rations if he has the will and spunk. Let him raise an abundance of these, then look to the stock.

It's always best to begin at the right end.

LEARN TO LIVE ON THE FARM

Some one has said that the farmer's family faces two problems—how to make a living on a farm, and how to live on a farm. Although many people would answer unhesitatingly that everyone knows how to live on a farm, while how to make a living is a very real problem, there is, after all, some doubt as to which is the greater problem.

Successful living in any place depends primarily upon the spiritual and mental attitude. One must be in sympathy with the natural environment in which he finds himself.

The family on the farm must have a feeling of permanency. They must believe that it is the best place for them to live, the ideal place for a home, the place where the children have the best opportunity to develop strong bodies, sound minds, and the characteristics that make for efficiency. They must be open minded and try to learn whatever they can that will improve farm conditions.

They must believe in wholesome recreation for themselves and every member of their household. They must realize that all the really worth while things of the city, such as household conveniences and labor saving devices, opportunities for education, for the enjoyment of music, art, or literature, and the companionship of others, are within their reach at some times and in some forms.

When they are convinced of these things and have learned "to love the wind and the rain, the growing things, the birds, and all the rest, the dawn, the early morning odors, and to find each part of the day, each twilight, and each nightfall filled with wonders," they will know how to live on a farm, and how to make a living on a farm will be less of a problem.

SHEEP-KILLING DOGS COST HIM $1,400.

"Keep up the fight against dogs. They destroyed $1,400 worth of sheep one year for me. I have followed them home, and pulled the wool out of their teeth, and their owner would tell me that his dogs were always tied up. Such men think more of a cur dog than they do of their wives or children. Our flock of breeding ewes made us an average in wool and lambs last year of $23.18 per head, but I can keep only a small flock near the house."

Thus writes S. Swartz of Ohio, in the February 1st issue of The Breeders' Gazette.

New Brunswick and Nova Scotia evidently are not the only places in which the cur dog does damage to sheep flocks. There is no time like the present to get after the dog nuisance. How can you do your share in the fight? You can do your share by writing a letter to your local representatives asking them to support the movement to tax dogs and compensate sheep owners for damages, when the farmer committees bring the matter to the attention of the legislature.

A WORD TO THE DAIRYMEN OF SUSSEX

Time and again the milk dealers of St. John have tried to pull the wool over the eyes of the dairymen who ship their milk to the city. They everlastingly dictate to the farmers the price they are to ask for milk. Promises made by dealers when it is difficult to get an adequate supply of milk and cream for the city trade, have been, in many instances treated as empty words. The attitude towards the farmers seems to be, so far as price is concerned, "hitherto shalt thou come, but no further," no matter what the price of feed and labor may be, or what prices may be ruling elsewhere for dairy products.

Recently, one of the big dairy companies in St. John closed its doors and the farmers of Kings county and elsewhere, who supplied the milk and cream for this concern, will have to await the decision of the courts for a small percentage of what is their due.

We know many farmers in the vicinity of Sussex who have been stung, some of them to the extent of from $200 to $400 each. The total amount due to farmers in the vicinity of Sussex from the company in question amounts to thousands of dollars.

Despite the fact that these farmers are a prosperous people, they can ill afford at this season, when feeds of all kinds are so abnormally high, to lose one dollar of the results of their labor.

What has happened so recently is only a repetition of what has happened before, and may happen again if our farmers do not get together and work together for a system that will give them ample protection against unscrupulous dealers.

The milk producers of New England have, after a long, hard struggle, succeeded in banding themselves together in such a way that they can now dictate instead of being dictated to, as was customary in the past.

(Continued on page 378)

THE PREPARATION OF LAND AND CULTURAL METHODS FOR POTATOES

(Continued from page 351)

	Bushels per acre. Merchantable	Small	Total.
1-20 acre Green Mountain, hilled	370	30	400
1-20 acre Green Mountain, level, machine planted	350	50	400
1-20 acre Green Mountain, hand planted	395	47.5	442.5
1-12 acre Green Mountain, hilled	360	45	405
Average of hilled plots	365	37.5	402.5
Average of level plots	372.5	48.7	421.2

I think it is to be assumed, however, that from the almost universal plan of hilling in vogue in this Province, that we here find it the best and easiest. Our larger rainfall, moist condition of soil and subsoil, and the practice of machine digging, all favour the system we follow, and while the figures above quoted show that the deep planting gave a slightly better yield under last years dry and warm conditions, I would not argue from this one test that the deep planting and level cultivation was the best system to follow.

The best distance apart to plant is a much debated question. A large amount of experience has led to the adoption by many good growers, or rows thirty inches apart and seed dropped twelve inches apart in the rows, as likely to give the largest yield per acre of medium sized choice table potatoes. Here again I can only give you the figures of one year's trial.

Amount of seed used, general average at different distances.

	Bush. per acre.
2½' x 12"	13.5
2½' x 14"	13
3' x 12"	11.1
3' x 14"	10.6

Total yield, general average at different distances.

2½' x 12"	397.5
2½' x 14"	355.5
3' x 12"	330.9
3' x 14"	338.6

Bushels of merchantable potatoes, general average at different distances.

2½' x 12"	311.7
2½' x 14"	322.2
3' x 12"	310.1
3' x 14"	321.6

Seven cultivations or once a week is none too much, plant food especially potash, is made available and the ground left in best condition for the digger.

Date of planting.—Late plantings have usually seemed to be most profitable, not only in larger yields of sounder potatoes, but also because less after cultivating and spraying was required. Our experience last season was however the reverse of this, on one field the crop planted May 15th yielding nearly 40% more than that planted on June 19th. In another field the crop planted on the 21, 22, 23 June gave us our largest yield.

I append herewith the cost of growing potatoes per acre as we have found it on one measured acre in 1915 and 1916.

Record for 1915 for one acre planted to Green Mountains, Irish Cobbler and Empire State

Seed 21 bushels @ 60c per bushel	$12.60
Cutting seed @ 10c per bushel.	2.10
Ploughing land twice @ 32c per hour	3.20
Harrowing twice @ 32c per hour	.64
Discing in manure	1.28
Barnyard manure, 16 tons @ $1.00	16.00
Applying manure, team and 3 men, 4 hours @ 68c	2.72
Fertilizer applied with potato planter—400 pounds	6.37
Planting 3 hours team, man and boy	1.41
Cultivating 5 times, 7½ hours @ 25c per hour	1.87

Hand hoeing, partially, 15 hours @ 18c	2.70
Weeding, partially, 2 hours @ 18c	.36
Spraying with Bordeaux, 6 times @ $1.25	7.50
Digging, man and team 4 hours.	1.28
Picking, 5 men, 5 hours each @ 18c	4.50
Hauling to cellar, man and team 3 hours	.96
Harrowing for recovery of additional potatoes	.64
Picking up and hauling off 6 barrels potatoes recovered.	1.00
	$67.93

Yield:

80 bbls. (165 lbs. each) marketable @ $1.75	$140.00
7 bbls. culls @ 50c	3.50
	$143.50
Profit (less land rent and depreciation)	$75.57

This land was rather wet naturally and during the very rainy weather of June and July was several times flooded, causing missed hills and inferior plants generally. This land was originally cleared many years ago, and after cutting hay for thirty years it was allowed to grow up to spruce, birch and alder. It was again cleared in 1913 and grew buckwheat in 1914.

Record for 1916 for one acre of Pure Green Mountains

Seed, 19½ bushels @ $1.00 per bushel	$19.50
Treating seed with Formalin solution	.50
Cutting seed @ 10c per bushel.	1.95
Ploughing land	1.60
Barnyard manure, 15 tons @ $1.00	15.00
Application of manure, team and 3 men, 4 hours	2.72
Ploughing in manure	1.60
Discing, 1½ hours @ 32c	.48
Harrowing twice, 2 hours @ 32c	.64
Planting, team and 2 men, 4½ hours @ 50c	2.25
Fertilizer, 450 pounds 4-10 mixture applied with planter	7.65
Cultivating, 5 times, 7½ hours @ 25c	1.38
Pulling weeds 4 hours @ 18c	.72
Horse hoeing (hilling) 5 times 7½ hours @ 32c	2.40
Digging, man and team 7 hours @ 32c	2.24
Picking 51½ hours @ 18c	9.18
Hauling to cellar 4 hours @ 32c.	1.28
Spraying 6 times @ $1.60	9.60
Harrowing and picking potatoes left by digger	1.64
	$82.33

High priced seed, higher priced fertilizer ingredients and very dear Copper Sulphate contributed to the increased cost over 1915.

Yield:—

120 barrels @ $2.25	$270.00
6 barrels @ 50c	3.00
	$273.00
Profit (less rent and depreciation)	$190.67

Market price when potatoes were dug was $2.25. Later they could have been sold @ $3.25 but are held for seed.

Address presented at the Annual Convention of the New Brunswick Potato Growers' Association, by W. W. Hubbard, Supt. Experimental Station, Fredericton, N. B.

SUSSEX SEED FAIR

The fourteenth annual seed fair under the auspices of the Sussex and Studholm Agricultural Society held on Tuesday was a great success.

The exhibition of seeds in quality and quantity was the best yet and augurs well for increased production.

The judging was done by Mr. S. J. Moore, Dominion Seed expert and the prize winners were as follows.

Prize winners at the Sussex Seed Fair

Wheat, White or Red Fife—7 entries—1st, W. H. Venning, Sussex, $5.00; 2nd, W. H. Venning, $1.50; 3rd, Frank Tamlyn, Newtown, $1.00; 4th, W. E. Wallace, Penobsquis, 0.50.

Wheat, any other variety—4 entries—1st, W. H. Venning, $5.00; 2nd, H. B. Parlee, Sussex, $1.50; 3rd, H. R. McMonagle, Sussex Corner, $1.00; 4th, J. Titus Barnes, Apohaqui, 0.50.

Barley, two or six-rowed—4 entries—1st, H. B. Parlee, $5.00; 2nd, W. H. Venning, $1.50; 3rd, J. Hayes King, Smiths Creek, $1.00; 4th, J. Titus Barnes, 0.50.

Oats, white, any variety, named—10 entries—1st, W. H. Venning, $5.50; 2nd. H. S. Secord & Sons, Penobsquis, $2.00; 3rd, W. H. Venning, $1.75; 4th, McIntyre Bros. Sussex Corner, $1.50; 5th, Leslie Walker, Lower Millstream, $1.25; 6th, W. E. Wallace, Penobsquis, $1.00; 7th, R. E. Floyd, Bloomfield Sta., $0.75; 8th, H. N. Flewelling, Sussex, $0.50.

Oats, Black, any variety—one entry—1st, H. B. Parlee, $5.50.

Buckwheat, Rough—7 entries—1st, H. B. Parlee, $5.00; 2nd, Leslie Walker, $2.00; 3rd, J. Frank Roach, Sussex, $1.00; 4th, W. H. Venning, $0.50.

Buckwheat. Smooth—2 entries—1st, H. B. Parlee, $5.00; 2nd, R. E. Floyd, $2.00.

Peas, Field, any variety—one entry—1st, W. H. Venning, $4.50.

Peas, Garden—4 entries—1st, R. E. Floyd, $0.75; 2nd, E. Roy Raymond, Bloomfield Sta., $0.50; 3rd, H. B. Parlee, $0.25.

Beans, white—one entry—1st, H. B. Parlee, $2.00.

Beans, colored—7 entries—1st, Mrs. H. R. McMonagle, Sussex Corner, $2.00; 2nd, E. Roy Raymond, $1.00; 3rd, R. E. Floyd, $0.50.

Corn, yellow, any field variety—2 entries—1st, McIntyre Bros., $1.00; 2nd, H. B. Parlee, $0.75.

Corn, sweet—one variety—1st, H. B. Parlee, $1.00.

Clover Seed, Common Red—one entry—1st, W. H. Venning, $3.00.

Clover Alsike—one entry—1st, W. H. Venning, $3.00.

Grass Seed, Timothy—4 entries—1st, McIntyre Bros., $3.00; 2nd, W. H. Venning, $2.00; 3rd, H. S. Secord & Sons, $1.00.

Potatoes, Green Mt. or Delaware—6 entries—1st, H. B. Parlee, $1.50; 2nd, J. Hayes King, $1.00; 3rd, H. S. Secord & Sons, $0.75; 4th, Irvine Mosher, Sussex, $0.50.

Potatoes, any white long variety—3 entries—1st, H. B. Parlee, $1.50; 2nd, McIntyre Bros., $1.00; 3rd, O. A. Wetmore, Bloomfield Sta., $0.75.

Potatoes, any rose variety—3 entries—1st, McIntyre Bros., $1.50; 2nd, H. B. Parlee, $1.00; 3rd, E. Roy Raymond, $0.75.

Potatoes, any round or short variety—4 entries—1st, H. B. Parlee, $1.50; 2nd, Irvine Mosher, $1.00; 3rd, McIntyre Bros., $0.75; 4th, W. E. Wallace, $0.50.

Potatoes, any red variety—2 entries—1st, H. B. Parlee, $1.50; 2nd, McIntyre Bros., $1.00.

Potatoes, any dark variety—4 entries—1st, H. B. Parlee, $1.50; 2nd, Irvine Mosher, $1.00; 3rd, H. S. Secord & Sons, $0.75; 4th, Kenneth Raymond, Bloomfield Sta., $0.50.

Six Turnips, any variety, for seed—2 entries—1st, H. S. Secord & Sons, $2.00; 2nd, R. E. McAuley, Sussex, $1.50; 3rd, W. E. Wallace, $1.00; 4th, McIntyre Bros., $0.50.

Oats from Standing Crosp Competition of 1916—7 entries—1st, H. S. Secord & Sons, $3.00; 2nd, H. B. Parlee, $2.50; r3d, W. E. Wallace, $2.00; 4th, R. E. Floyd, $1.50; 5th, H. N. Flewelling, $1.00.

Recapitulation of Individual Winnings

H. N. Flewelling	$ 1.50
Irvine Mosher	2.50
W. H. Venning	33.25
J. Titus Barnes	1.00
H. B. Parlee	37.00
R. E. Floyd	5.50

Total prizes paid	$121.25

The Auction Sale of First Prize Grain resulted as follows:—White Fife Wheat to Fred Whalen, Sussex, at $3.25 per bushel. Marquis Wheat to W. H. Venning, Sussex, at $5.25 per bushel; Barley, O. A. C. 21 to H. B. Parlee, Sussex at $3.00 per bushel. Oats, Regenerated Abundance, to Fred Whalen at $1.25 per bushel. Oats, Black, to H. B. Parlee at $5.50 per bushel. Buckwheat, Rough, to H. B. Parlee at $2.25 per bushel. Buckwheat, Smooth, to H. B. Parlee at $3.50 per bushel. Field Peas to J. T. Prescott at $2.25 per half bushel.

TREAT SEED POTATOES FOR SCAB

Prof. E. L. Kirkpatrick, New York

The per cent of scabby tubers in this season's crop will be reduced if seed potatoes are treated with formalin or corrosive sublimate before being cut to plant. The formalin treatment consists of soaking the tubers for two hours in a solution of formaldehyde and water at the rate of one pint to each 30 gallons of water. The other treatment uses two ounces of corrosive sublimate to each 15 gallons water. (Corrosive sublimate is very poisonous and should be used with care.) Tubers are given the same time in this liquid as in the formalin.

Either treatment may be given by placing the tubers in an old gummy sack and lowering them into a barrel or tub containing the liquid. Tubers may be spread out on the grass or barn floor to dry, after which they are ready to cut and plant. Any number of sacks of potatoes may be treated in either solution. Since formalin evaporates very rapidly the vessel containing it is kept covered to preserve the strength of the ilquid.

THE OLEO SUBMARINE

The latest effort of the oleo people to secure favorable legislation in the U. S. Congress has failed. They wanted the internal revenue law changed, whereby all oleo, colored and uncolored, would pay a flat rate of 2 cents a pound. This would mean reducing the 10-cent tax on oleo colored in imitation of butter, and raising the ¼-cent tax on uncolored oleo to the figure first named. Had such amendment become law it would have meant greatly increased sale of colored oleo, much of it reaching consumers in the guise of pure butter.

HORTICULTURE

STRAWBERRY GROWING FOR PROFIT

Address by Manning Ells to the Short Course Students, N. S. A. C., Truro.

Strawberry growing as a commercial venture is not being over done in the Maritime Provinces. No other fruit is so universally eaten in its season, and every little town supplies a fair sized market. Indeed, some of the low prices of the past came from neglecting the small towns and sending all the supplies to the three or four large markets. Growers did not realize that these large markets made the price quotations for the rest of the country and when they got an over supply, prices would rule low all over. There is a demand for all the berries now being produced in these Provinces at very profitable prices and the main selling problem is one of distribution. Supply the home market first, and ship to the larger markets only what cannot be disposed of in your own town.

In growing berries, no especial farming knowledge is required. Anyone who can have a garden or can grow good crops of turnips or potatoes will experience no trouble raising strawberries. They will grow on any good tillable land, but land not naturally well drained, or if it has a clay subsoil not tile drained should be avoided. Such land is apt to heave badly in the winter and cause winter killing of the plants. If you must plant on wet land, ridge the ground up with an inthrow disk harrow, going over the same place several times with the harrow, and plant on top of the ridge. This method is followed with great success by some of the berry growers of New Brunswick. Do not plant on ground that has been in sod some two or three years previously. The common June bug lays its eggs in grass land, especially in old pastures or hay land that has been down some time. The larva of this bug or the white grub as it is commonly called, lives on the grass roots for some three years before coming forth as the June bug, and is very fond of strawberry roots. This grub is seldom bothersome where a short rotation is practiced on the farm, nor is it found in light loams as often as on heavier land.

If the land has been in hoed crops such as turnips, corn or potatoes for two or three years, it is in the best possible condition for planting strawberries. It is taken for granted that barn yard manure has been used liberally on these preceeding crops and become well incorporated with the soil. It is not advisable to use strawy manure the same year plants are set if one is looking for best results. Prepare the land in the spring either by plowing or, if it was plowed the fall before, by deep disking. We follow the smoothing harrow with a planker, to break up any lumps and firm the ground for setting. Make a marker by placing three or four six inch boards, three feet long on edge the distance apart you desire your rows to be, rounding one end of the boards to resemble a sled runner. Run a line to mark the first row, and then by using the marker, pulling it up and down the field, the rows will all be absolutely the same distance apart and parallel with the first row. By being a little particular in this point of having the rows all the same distance apart, the labor of hand hoeing will be greatly lessened, as the cultivator can be set to run very close to the plants.

From three and a half to four feet between the rows is about right and from twelve to twenty inches in the row, depending on the variety. Plants put out early in the spring should be placed further apart than those planted later in the season, as they will make many more runners and a thicker row.

Do not take plants from an old bed, or the last plants formed in the summer in a new bed. Large plants of the previous seasons groweth with well developed roots and a large crown are best. In digging plants, we take up the whole row, throwing away the old mother plant and those that have rooted too late to develop properly. It has been proven on our Experimental Farms that the large plants give almost twice the crop of small alley plants taken from between the rows. Of course, the plants of some varieties are much smaller than others. The Warfield and Senator Dunlap are very small plants when set in the spring, but they make the biggest row of them all.

It does not make much difference how the plants are set, and if the root is exposed equally disastrous results will take place from drying out. Some use a hand dibble or trowl to make the holes for the plants, others use a shovel or spade, one man making the holes for two or three planters that follow. This past season I saw a splendid field where the rows were opened with a light plow, a boy dropped the plants the proper distance apart and a man followed holding the plant in position with one hand against the land side while he pressed the earth against the roots with the other; afterwards the operation was finished with the hoe. Cultivate between the rows as soon as convenient, after plants are set to conserve moisture, and also about the plants with the hand hoe, and continue this cultivation as it seems needed, right through the growing season. By stiring the ground early and often, all the weed seeds near the surface will be sprouted and killed. This is quite important, as it is a very hard and expensive job to kill weeds that sprout late in the season, after the runners have made a good growth.

The strawberry plant is a rank feeder and it is generally advisable to use some kind of commercial fertilizer along the row during the growing season. On fairly loamy or heavy land we use about half a ton of commercial ground bone to the acre; on lighter land, nitrate of soda and acid phosphate will give quicker results. One hundred and fifty pounds of nitrate mixed with three hundred and fifty pounds of acid is a good dressing for one acre, and if applied along the rows two or three weeks after setting the plants, will give them a wonderful start. Do not sow this mixture when the plants are wet, for it will burn the leaves. Some of the animal nitroginous fertilizerss, such as ground blood or dog-fish fertili er give splendid results in growing berries. In fact, no one need be discouraged from growing strawberries because of a lack of barnyard manure. By using a cover crop or one year clover sod to furnish the necessary humus, most profitable and satisfactory crops can be grown on commercial fertilizer alone.

At the ending of the growing season a shallow trench or furrow should be left between the rows, that water may not stand on the plants at any time during the winter and they become covered in ice. Plants will always die when frozen over with ice in the winter.

As soon as the ground is frozen hard in December, mulch the plants with straw, rushes or marsh hay. The latter is to be preferred if you have it, both on account of freedom from weeds and because plants always looks fresher and nicer in the spring when it is used. We put this mulch on as lightly as possible, for as long as the plants are shaded they will do all right. The mulch is merely a

PEERLESS
PERFECTION
A RUNAWAY HORSE
can't break a Peerless Fence. No fiery bull can make a dent in it, hogs can't push through the spaces.
It holds them all securely. Ask your nearest dealer to show you the Peerless farm fencing. See the heavy, crimped horizontal wires that allow for all expansion or contraction in extremes of temperature. See the famous Peerless lock that holds the intersections in a firm, non-slippable grip. See the Peerless farm gates. Your dealer guarantees the Peerless to give satisfaction and we stand back of him unconditionally.
Letters Like These from Halifax to Vancouver
The Banwell-Hoxie Wire Fence Co., Ltd.
Hamilton, Ontario
Dear Sirs: I am writing a testimonial as to the strength of your PEERLESS Junior Chicken Fencing. Mine is four feet high. It turned two horses, each weighing 1400 pounds. They ran full tilt into the fencing about 2 rods from each other at the same time. The result was that they turned a summersault over the fence, alighting on their heads and necks, scratching them up some, but the fence remained intact. Yours truly,
JOE BOOTHROYD.
Surrey Centre, B. C.
The Banwell-Hoxie Wire Fence Co., Ltd.
Hamilton, Ontario
Gentlemen: I have handled your fence four years and find it a good, strong and durable fence, and find that the galvanizing is first-class. In referring to this I have a fence that I put on four years ago across a gulley and the water is as high as the second wire and it is not rusted nor broken yet. I have a team of heavy horses that ran into the fence last summer and did not break or damage it in the least, and I am glad to say that in the four years I have handled your wire I have had no complaints about it.
Yours truly,
DAVID CUMMINGS.
Bowesville, Ont.
The Fence That Saves Expense
It never needs repairs. It is the cheapest fence to erect, because, owing to its exceptionally heavy top and bottom wire, but half the usual amount of lumber and posts are required.

The work is so simple and easy that even beginners make big profits from the start.

AMERICUS EVERBEARING

plants produce big crops of big fancy berries from June until Frost, in fact light freezing does not affect their Fruiting. The Berries are in great demand. Three months after plants are set your profits begin. Our FREE BOOK, tells the rest. Write for it today.

DUPUY & FERGUSON MONTREAL

protection against alternate freezing and thawing during the winter and early spring. As soon as growth starts in the spring draw this mulch between the rows to keep the berries clean and the ground damp about the plants. Dirty, sandy berries are not fit to send to any market.

If one is picking a half acre or more of berries, a shed of some kind should be built to hold boxes, crates, etc., and where the fruit can be taken as fast as picked to be protected from the sun. Let one person have charge of placing the boxes in the crates, and see that these boxes are properly filled. Perhaps nothing causes so much dissatisfaction in the market as slack boxes. The trays that are provided with the crates have a cleat about a third of an inch thick that allows the box to be filled a little above the rim without damaging the fruit. Fill the boxes so these show red on the underside when taken out. Level the top of the box seeing that there are no slack places, so that when the box shakes down as it will, it will still look nice and full. Pack berries as soon as picked, they are hard then and will stand a little shaking. The boxes should fit the crate so that when the cover is nailed down, they will be held firm and tight. Loose boxes in a crate will not stand a railway journey and deliver the fruit in good condition. It is better to pick berries a little green than too ripe, but let it be only a little green. Berries are not too ripe as long as the hull is green, but berries with a brown dead hull will decay within a few hours of being picked, and should never be placed in a box that is sent to market.

When the picking season is finished we mow off the leaves and remove them together with the old mulch; the space between the rows is narrowed up with a light plow, and then harrowed, cross wise if possible, with a spike tooth harrow. A fertilizer of nitrate and acid in the same proportions as used when the plants are set will cause them to make a vigorous growth before autumn and usually a two thirds crop will result the next season with no further expense except the picking. Considering the labor expended this second crop is about as profitable as the first. With this system, after the second year the old bed should be broken up. In the best strawberry parts of New Brunswick four or five profitable crops are taken from the same bed, but here local conditions are such that labor is plentiful, and the beds are cleaned of weeds by hand each season.

The profit in growing berries as in all other farm crops will vary from year to year, but in my experience the balance has always been on the right side of the ledger. With the present price of farm labor, when it can be got, an acre of berries will cost a little less than one hundred dollars to picking them. Last season our berries cost us 5.3 cents a box F. O. B. shipping point, and the net profit an acre was one hundred and ninety-six dollars. This was with a small crop and almost any farmer could duplicate this return or do better.

There are hundreds of varieties of strawberries and more being introduced every season, but some of the old kinds that were popular twenty years ago, are still at the top of the heap. For an early berry that does well under all conditions we have never tested any that equaled the Senator Dumlap. For midseason, Warfield, Glen Mary, Arnout, Wm. Belt and Haverland are all good and in these provinces the most popular late berry is the Sample. In the Annapolis Valley, where the early market gives the most money, the Senator Dunlap is planted almost exclusively by com-

(Continued on page 377)

Make Money this year from your "Sugar Bush"

Hundreds of farmers to-day make more profit from their "SUGAR BUSH," with less time and labor, than they do from any other crop on the farm.

The demand for Maple Syrup and Sugar is greater than the supply, therefore, prices are good and there is always a ready market.

If you have Maple Trees on your farm which you are not tapping, you are losing good money. Maple Trees always produce a fair crop. They need no care of any kind, yet, each year produce more, and are tapped at a season when you cannot do other kind of work.

WRITE TO-DAY, and let us tell you how to make the most out of your Maple Trees with the least time and effort. Write NOW for FREE information.

STRAWBERRY PLANTS !

Strawberry Growing is NOT overdone in the Maritime Provinces. Every town is a good market, every grocery store sells Strawberries, everybody eats them. Berries are easy to grow and easy to sell, and the cash for the crop comes at a time when cash is a very scarce article on the farm. We grow as good plants as can be grown anywhere, we have the best varieties yet known to Strawberry growers, and our prices are no higher than last year at a time when all prices are up. Write for our Catalogue and Price List at once. Big or small make your plans early to start a patch of berries this season.

DAIRYING.

THE MOST SENSATIONAL COW IN THE WORLD

The purebred Holstein-Friesian cow, Segis Fayne Johanna 114658, realized the long-cherished hopes of enthusiasts and electrified the dairy world when, under an official seven-day test ending January 8, she established a new world's record for butterfat production, producing in seven consecutive days 730.8 pounds of milk containing 50.68 pounds of butter. This remarkable animal has scored a brilliant triumph for the Black-and-White breed.

The pessimist had for years scoffed at the optimist's prophecy that some day a cow would surmount the 50-pound barrier, but with Segis Fayne Johanna's accomplishment what seemed the "almost incredible" has happened.

Segis Fayne Johanna is the property of Oliver Cabana, Jr., proprietor of Pine Grove Farms, Elma Center, N. Y., and was bred by A. A. Cortelyou, of Somerville, N. J., having been purchased by the present owner at a breeders' sale on January 5, 1913. She is eight years old, weighs now about 1450 pounds, and in color is four-fifths white. Her sire is King Fayne Segis 46767 and her dam is Vikina Johanna 64385.

The new seven-day butter champion, the sixteenth Holstein-Friesian cow to obtain a place in the 40-pound class, is the fifth world's champion to be developed at Pine Grove Farms, so a brief resume of the methods of feeding and care in operation at this noted establishment, particularly those employed in the test of Segis Fayne Johanna, is of extraordinary interest.

The test was made in a roomy, clean, white enameled stall, under the supervision of representatives of the New York State Agricultural College, at Ithaca, N. Y. She was milked every six hours. From the time she went dry to ten days before freshening the new champion received the customary rations used at Pine Grove Farms, consisting of 30 pounds grain, 40 pounds beets and 30 pounds of beet pulp soaked in molasses. She was then fed a test ration of 16 pounds, increasing gradually to 25 pounds, consisting of the following mixture:

200 pounds dried distillers' grain,
100 pounds bran,
100 pounds ground oats,
125 pounds gluten,
100 pounds cotton seed meal,
80 pounds oil meal,
15 pounds table salt,
10 pounds charcoal.

On the third day after freshening she was given 16 pounds of grain until the sixth day, when two pounds were added, which was systematically increased to 31 pounds. Two pounds of cotton seed meal was also provided and, with the following, made up the balance of the ration:

40 pounds ensilage,
100 pounds roots,
32 pounds beet pulp,
12 pounds hay.

Rock salt and plenty of water were accessible to her at all times.

The test began December 28, 1916, and the verification and observation tests began at 4.30 p. m. on January 2 and continued for 48 hours. During the period the following supervisors were in charge: Ray Huey, Spencerport, N. Y.; R. V. Callahan, Clyde, N. Y.; S. H. Waldo, Castile, N. Y.; C. F. Mason, Seneca Castle, N. Y.; and F. A. Linzy, Darian Center, N. Y.

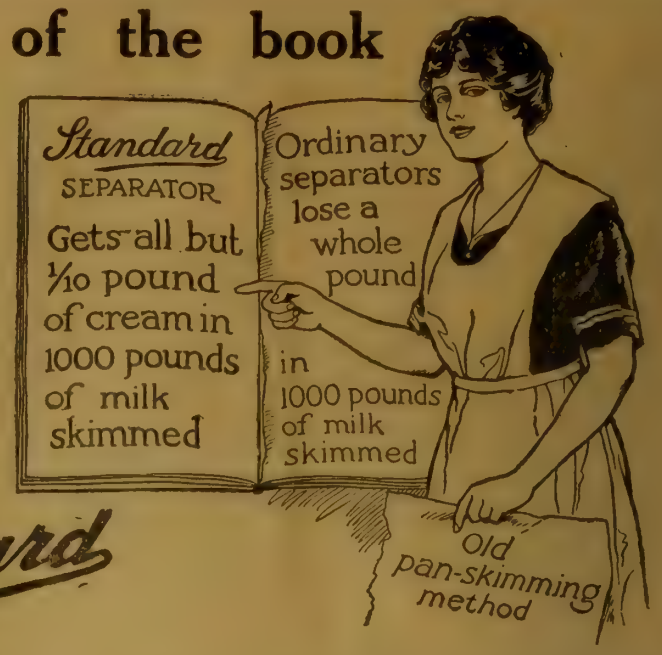
A study of the following certified table, giving in detail the milk and fat taken daily from December 28 to January 8, will prove of interest:

Date		Lbs. Milk	Lbs. Fat	Lbs. Butter
Dec.	28	97.9	5.667	7.083
	29	101.3	6.052	7.565
	30	104.1	5.466	6.832

The Purebred Holstein-Friesian cow, Segis Fayne Johanna 114658.

On which side of the book is YOUR Cream Separator?

ASK yourself this question, "Which will pay me better, (1) to buy an ordinary separator that costs, say, $55.00, and lose a whole pound of cream to every 1,000 pounds of milk skimmed, or (2) to invest in the



Standard
SEPARATOR
Gets all but 1/10 pound of cream in 1000 pounds of milk skimmed
Ordinary separators lose a whole pound in 1000 pounds of milk skimmed
Old pan-skimming method

Standard

—the separator that gets all but one-tenth of a pound of cream per 1,000 pounds of milk skimmed, and costs, say $75.00?"

The answer is that with a Standard you save in one year, with twenty cows, no less than $27.25. Here are the figures:

	Standard	Ordinary	Pan Skimming
First cost	$ 75.00	$ 55.00	
	7	7%	
Interest	$ 5.25	$ 3.75	
Add Depreciation	3.75 (5%)	5.50 (10%)	
Add Loss in Cream	3.00 (.10%)	30.00 (.10%)	$ 70.00
	$12.00	$39.25	$ 70.00
Saving over ordinary separators			$27 25
Saving over old pan skimming			58.00

The Standard's close skimming is substantiated by tests made at Government Dairy Schools. The Standard soon pays for itself, not only by saving cream, but by its longer service capacity. That is why only 5% is figured above for depreciation in the Standard and 10% for ordinary separators.

The Standard gives more years of service due to its self-oiling system which decreases wear and tear (all bearings run in a mist of oil), spindle shafts made of tool steel instead of ordinary cold rolled steel, centre balanced bowl, etc., etc.

The Standard has been tested for 15 years farm use without apparent wear. Will it not pay you handsomely to have the up-to-date, close skimming Standard? Let us send you a Standard so that you may test it in your own dairy. Catalogue free on request.

The best previous seven-day butter record was 46.772 pounds, established by the purebred Holstein cow, Hester Aaltje Korndyke 133222, owned by M. J. Smiley, of Bellefourche, South Dakota.

The flattering success obtained by Mr. Cabana at Pine Grove Farms has naturally brought him into the glare of the limelight. As he expresses it, he went into the breeding of Holstein-Friesian cattle because of the great interest attached to it. He says further: "It means to me the developing of the most useful animal in the world. I find it fascinating to watch the progress and improvements we make through the application of scientific and intelligent breeding methods." Mr. Cabana has long been a prominent citizen of Buffalo, connected with various large business interests. He is an indefatigable worker and, despite his business enterprises which demand so much of his time and energy, he is intimately in touch at all times with the doings at Pine Grove Farms.

The enthusiasm and unison of progressive spirit existing among the Holstein-Friesian cattle breeders is best expressed in the telegram from the owner of the eclipsed record holder to the owner of the new champion which reads: "Congratulations on the 50-pound cow. Now that the impossible has been accomplished, where is the end?"

PRINCE EDWARD ISLAND'S DAIRY OUTPUT

The number of factories in operation was 39. Of these 28 made cheese and 11 made butter. The milk supplied for cheese amounted to 23,328,880 lbs., and for butter to 12,778,660 lbs—a total of 36,107,540 lbs. The gross value of the cheese manufactured was $409,495.22, and of the butter $184,164.20,—a total of $593,659.42.

The patrons supplying milk for the manufacture of cheese numbered 2324, and of butter 1409—or in all 3733.

It is to be noted that a very large proportion of the butter made in P. E. I. last year was made at home and of this latter we have no record.

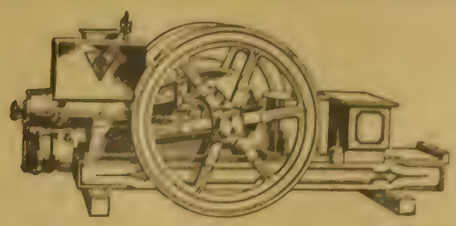
GREASE CURES TEAT WARTS

Grease is the most successful remedy I know for the long hard warts that form on the teats of milch cows. I have used carbolated vaseline, fried meat drippings and common machine oil with satisfactory results. Castor oil did not give good results. This treatment requires persistence. Failure usually is due to imperfect treatment.

Common machine oil is the best grease to use, and if applied regularly twice a day and thoroughly rubbed in good effects will be noticed within two weeks or so. With meat drippings it will be about a month before improvement is noticeable.

Two teats on one of our cows were simply covered with great bunches of warts when she first freshened. I could have clipped these warts off and applied lunar caustic, but I began treating them with grease, smearing it on thickly each time I milked, and working it well into the warts. In about five months the warts had disappeared.—F. Knox.

Doris Clay, a milkink Shorthorn owned by L. D. May, Granville Center, Pa., during the year ending January 22nd last, produced 17,241.5 pounds of milk and 653.5 pounds of butter fat.



Think of all the work this ALPHA GAS ENGINE would save you

WITH this simple, strongly built engine you can saw wood, run a pump, cream separator, churn, washing machine, feed cutter or feed grinder, and save time and labor around your farm.

If you need a gas engine, it will pay you to buy a good one. An ALPHA costs little more to begin with than a cheap, poorly designed engine, and will quickly make up for any difference in the first cost by the longer and far more satisfactory service it will give you.

The ALPHA is simple and durable in construction and is free from any of the complicated, delicate parts that make some engines a constant source of irritation and expense. You can operate it with either gasoline or kerosene, and it will develop its full published rating with a minimum amount of either.

An ALPHA is a saving investment any way you look at it. It will save the money you now must pay out to get done work that requires power, because you can own and operate it for less than it would cost you to hire some one with an engine, and it will do quickly work you are now doing by hand and give you more time to attend to other work. The sooner you get an ALPHA, the sooner it will pay for itself.

Ask for catalogue, prices and complete information. Made in eleven sizes, 2 to 28 H. P. Each furnished in stationary, semi-portable or portable style, and with hopper or tank cooled cylinder.

Supplying the Demand for Royal Purple Calf Meal

This baby food for young animals is partially pre-digested, and can be fed to the youngest animals with perfect safety. It WILL NOT cause stomach or bowel trouble, which are serious ailments in young animals. Royal Purple is a sure preventive for scouring.

Calves Gain Rapidly Without Milk

When the calves are 3 or 4 days old they can be fed Royal Purple Calf Meal and raised just as well without one drop of milk. What prominent breeders remark:

Mr. Geo. W Collins, Plainfield Ont., writes:

"Gentlemen,—In regard to your Calf Meal, I think you have the best on the market, as people who have bought it give it great praise. Some have taken their calves off sweet milk, and feed them nothing but your Calf Meal and water, and say they are doing as well on it as they did on the whole milk."

To Whom It May Concern: Uxbridge, Aug. 5th

This is to certify that I have secured your "Royal Purple" Calf Meal from our druggist. Mr. T. C. Nicholls, of Uxbridge, and can speak of this meal in the highest terms. I have used other calf meals, but this one is the best I ever tried. I never saw a calf gain more rapidly and thrive better than mine did while using your "Royal Purple" Calf Meal. I can cheerfully recommend it to all our stockmen who wish to raise large, healthy calves."—Stanley W. Croxall.

Note—The above Mr. Croxall keeps a large herd of pure-bred Holstein cattle, and is an excellent authority on Calf Foods.

Royal Purple Calf Meal is equally good for young colts, lambs and young pigs. Put up in 25-lb., 50-lb. and 100-lb. bags. Secure it from our dealer in your town.

SHEEP AND DOGS

Editor The Maritime Farmer:

I have noticed the efforts of the Farmer in the matter of increased production; particularly in sheep. It is the fashionable thing now-a-days, for Editors and speakers at agricultural meetings to condemn the dog as the sole cause of the enormous decline in sheep farming. In my opinion the dog bogey has little or nothing to do with the practical abandonment of sheep farming in many sections. It is an easy excuse for not doing something that many more should be doing. Horned cattle have decreased in numbers as well perhaps not in the same proportions, but a decided decrease. One might as well stop growing hens, because the hawks often get a part of the chicks.

Forty years ago, when every farm had its flock of sheep and its dog, the dog was not a live issue, the farmer and his family were dressed in home grown cloth, and quite a proportion of his income was derived from sheep products. I remember when my father trucked frozen mutton eighty miles to Halifax and sold it there at five cents per pound. In those good old days a lamb skin brought a quarter, a sheep pelt one dollar; wool we sold at the corner store for fifteen cents per pound in trade. At that time there were twenty flocks of sheep in gunshot of my home and quite as many dogs. No one then was talking of the "dog nuisance." "The lion (dog) and the lamb lay down together."

Now, the institute man and local politican, when speaking to a rural audience thinks it good policy to excuse the shiftless lack of sheep production by throwing the odium on the dog.

Admitting for the moment that the dog is the trouble, what are we going to do about it? The Provincial legislatures have been making dog laws since my earliest recollection. Prof. Cumming says the Nova Scotia Sheep Protection Act is the most drastic in Canada, admitted, but any legislation is useless unless enforced. The weakness of it all is, there is no official "dog killer." To give concrete evidence, the Municipal Council of Kings County have been endeavoring for the past ten years to enforce the Nova Scotia Act. A tax of one dollar each was ordered to be levied on all dogs, to be collected by the local tax collector. That looked easy; but how did it work out. There are fourteen wards in the Municipality and fourteen tax collectors. The first year one collector reported a few dollars in dog taxes, the other thirteen said nothing about dogs. The Council in its wisdom ordered the collector who had done his duty to pay back the dog tax, as no other ward had collected it. This, by the way, the collector promptly refused to do and lost his job in consequence. The collectors of course were under bonds for the collection of the usual property tax, but could not be bonded for the dog tax, as it was impossible to know how many dogs there were in a ward, and the auditor could not check up the collections. Then the assessors were instructed to assess the owners of dogs. This also was a failure. Some made an attempt to assess, others made no attempt; no one did the work thoroughly, so confusion reigned supreme. Some tax collectors charged a dog tax to every householder, others let it go entirely. One year I discovered I had paid taxes for two dogs, being assessed for two places and never owned a dog in my life. The imposition of a dog tax in this county has not had any effect in lessening the dogs. Nor do I think it will have any effect in any way on the sheep industry. Any responsible person who values his dog will pay one dollar tax when called on, while the irresponsible people will keep the dog and evade the tax in some way, unless drastic measures are taken. A five per cent commission for collecting a one dollar tax is no particular inducement for the collector to make much effort in getting it. The clause in the Act providing that any person may kill a dog found wounding or persuing sheep is all very well, but who will catch the dog. No sheep man would ask for any law at a time like that, if he can catch the dog. Clause (V) "Any person may kill any dog being at large without a collar, etc., is so much waste of legislation for no man is going round with a gun, shooting every dog he sees.

After some fifteen years experience of honest effort to enforce the dog tax in this Municipality, in an endeavour to encourage sheep production, I am of the opinion that the dogs are not one less nor the sheep one more by reason of these attempts. We must forget the dog fad and look for other reasons for the lack of production.—S. C. Parker, Berwick, N. S.

"With your Milking Machine I can Produce Milk of Superior Quality"

The writer of the letter below is known throughout his district as a keen and rather critical judge of dairying methods and equipment. They say he is a "crank" on quality! Certainly the John D. Duncan Co., of Montreal, are most particular about the purity of the milk they get for their patrons.

RIVERFIELD, QUE., Jan. 25, 1917

Gentlemen:—
I have noticed some of the testimonials you are publishing and thought I would let you know how I like the Empire Milking Machine and Empire Engine which I purchased from you in the month of April, 1916. It has given entire satisfaction. I have had considerable experience with engines for many years, and am consequently in position to appreciate the merits of the Empire, and recommend same as one of the most reliable for milking machine and general farm work.
With your Milking Machine I can produce milk of superior quality, according to the statement of the John D. Duncan Co., to whom I have been shipping. I find that the machine is in no way injurious to the cows or teats, and no other trouble has been experienced. The speed at which the machine can milk is regulated by the class of cows and the quickness of the operator.
J. R. McKELL.

EMPIRE
Mechanical Milkers

produce milk of high quality, at the same time that they save time, reduce expense, increase profits, and make it possible to keep up and even increase the number of cows milked, in spite of the growing scarcity of help. They certainly are worth investigation.

Write for Booklets explaining the correct nature principle on which the Empire works, and giving the experience of prominent Dairymen who are using it. Address Dept. L

Farm Horses
in the Spring

Must spend long hours at hard work. Their systems should be strengthened —their blood purified—their digestion and assimilation made better.

INTERNATIONAL
Stock Food Tonic

tones up the horse's system, gives him new life and a glossy coat of hair, purifies the blood, and quickly puts run down and out of condition horses in good shape.

Its cost to use is remarkably small—
"3 feeds for one cent."

Thousands and thousands of farmers in all parts of Canada use International Stock Food Tonic at this season of the year to help put their horses in proper condition for the heavy Spring work.

Start right now getting your horses in proper shape. Buy a package or pail from your nearest dealer. Try it on some of those unthrifty horses. You will quickly see a change.

International Stock Food Tonic has stood the practical test of farmers everywhere for 27 years. Why experiment with substitutes or imitations?

International Stock Food Tonic is put up in 50c. and $1.00 packages, $1.50 lithograph tins, and 25 lb. pails at $3.75 each.

Buy from your Dealer. If he cannot supply you write us direct. 203

INTERNATIONAL STOCK FOOD CO., Limited
TORONTO • ONTARIO

CO-OPERATIVE WOOL SALES

Wool buyers are again at work in the Maritime Provinces. They generally have a pretty fair idea of what prices will prevail at shearing time, and if prices are likely to drop, they would not naturally be trying to make contracts at this early date.

If there is any benefit coming to the sheep-raiser in the shape of higher prices for his wool, he is entitled to every cent of it. By the system of selling co-operatively, good prices have been secured in many other lines of farm products, and the same has been proved true in regard to the disposal of wool. The Prince Edward Island Wool Growers, The Antigonish Wool Growers and the Sussex Wool Growers have given the co-operative sale of wool a fair trial, and the results have been more than satisfactory to the growers.

In the spring of 1915 the Sussex Wool Growers realized 37, 35, 33 and 31 cents per pound for their unwashed wool, according to grade, when the prices being paid locally and by wool buyers, who scour this territory every spring, was from 28 to 29 cents. In 1917 they realized 38¼ cents per pound, which was several cents above the prices offered locally. Money talks and it was quite gratifying to the secretary when handing out the cheques, after the wool had been sold, to hear the growers remarks that the various amounts were handsome figures in excess of what they would have been, if the co-operative sale system was not followed in this vicinity.

To the stand patters, who do not think it worth while to join their fellow farmers in any co-operative movement, we would say that they are profiting by the co-operation of their more progressive neighbors, and they may rest assured that, were it not for the co-operation existing in their vicinity, the prices offered for their wool by the buyers would be several cents lower than they are forced to offer in an attempt to come anywhere near the prices realized by the co-operators

The story is told of a prominent dairyman in Yarmouth County, N. S., who had a good market in town for his butter at the time the creamery was there established. He would not patronize the creamery—he would make butter at home.

The party to whom he sold his entire output told him: I have been paying you 30 cents per pound for your butter, the quality is excellent and I am willing to pay you as much per pound for it as I have to pay for creamery butter, viz. 32 cents per pound. The fair-minded dairyman, despite the fact that he was a stand patter at first, so far as the creamery was concerned, replied: If the creamery is the means of getting me two cents per pound more for my butter, it is up to me to patronize the creamery, and he did, and is today one of its staunchest patrons.

Would that there were many more farmers as fair minded as this Yarmouth farmer.

A farmer brought his washed wool to the Agricultural School in Sussex in 1915, but would not leave it as he could not get his cash for it that day. He put up the argument that there would be so many deductions for fees, etc., that he would prefer to sell elsewhere, where he would know just how much he was going to receive for it. He was not a co-operator. He was not willing to take any risks. Another farmer on hearing his argument asked how much he would take for his wool? He replied, "I will take 30 cents per pound, the price I can get for it from the other buyers today. The wool was weighed and changed hands immediately at the price stated.

The new owner put the wool in with his own for co-operative sale, and two weeks later when the wool was sold, he realized 45 cents per pound for it.

The farmer who seels his wool co-operatively can not possibly get any less for it than he is being offered by local buyers, and his chances are good to get a great deal more.

YOUR EYES

Poor vision often account for the nervous condition, so often found in children, headaches and so-called growing pains. Errors in vision very frequently cause cross-eyes and if a child begins to snow symptoms of cross eyes, no matter how young, the eyes should be properly tested, and if necessary treated, as such conditions usually increase, and after they have reached the stage where one eye only is used, the othe reye loses its vision to a greater or less degree.—Louisiana State Board of Health.

DE LAVAL
The First, the Best Known and the Greatest
CREAM SEPARATOR

Better Now Than Ever Before

THE first practical continuous cream separator, the De Laval has easily maintained its original success and leadership for nearly forty years. Step by step, year after year, by one improvement after another, the De Laval has led in every single step of cream separator development and improvement.

The first belt driven, the first steam turbine driven, the first of every kind of hand turnable, the first disc bowl, the first blade bowl, the first bottom or suction feed, the first split-wing feed, the first feed-through-the discs, the first self-centering bowl, the first automatically oiled—all these and a hundred other features of separator development and improvement have been conceived by De Laval inventors and perfected by the De Laval Company, most of them to be cast aside for something still better in the ever onward advance of De Laval construction.

The New 1917 De Laval

And now, in the De Laval machines for 1917, a number of new and still further improvements have been made, which make the De Laval machines of today much better in many respects than they have ever been before.

Their capacities are greater per dollar of cost; they skim cleaner under the more difficult conditions of separator use; they are equipped with the most improved speed regulator, thus insuring the proper speed necessary for complete separation; they are even better lubricated, and the bowl construction is even more sanitary than ever.

In other words, superior as the De Laval machines have always been to all would-be competitors and utilizers of abandoned De Laval features, the De Laval machines of 1917 are improved and superior in every way to all previous types and models of De Laval construction.

All these improvements and new features are described and explained in the new 1917 De Laval catalog now ready for mailing, but some of them are difficult to describe and make fully understood by words.

Be Sure to See a New De Laval

The new De Laval machines themselves best explain their new and superior features, and their use does this more completely and convincingly than even an examination of them. Every local agent is glad to afford opportunity for examination, and better still, for home test of a new De Laval machine.

But the demand for the new machines is a month ahead of the possible supply under the present difficult conditions of manufacture and freight distribution. More De Laval machines by half have been made in 1917 than ever before, but the De Laval Works is now ten thousand machines behind actual orders, and the demand is ever increasing.

Hence, the importance of securing a machine quickly if your local dealer happens to have one, and of ordering well ahead if he does not. And likewise, the importance of waiting patiently a little for a machine if need be.

A new De Laval catalog will be gladly sent on request, and if you don't know your nearest local agent please simply address the nearest De Laval main office as below.

THE HORSE

HELP THE HORSE TO UNDERSTAND YOUR COMMANDS

Is it not delightful to work a thoroughly broken, well matched team? By matched team, for this purpose, is meant, a pair nearly or quite equal in pulling power and ambition. If they are of the same color and markings so much the better. If one has never worked a thoroughly broken or educated team, and many men have not, he may imagine a pair of horses working with the smoothness of a machine yet superior to the machine because of intelligence. A machine may be called automatic, but it is still inanimate. Imagine a team that promptly responds to a word without its being repeated. You are planting and have gotten slightly off the gauge mark; you pull ever so lightly on the line in the direction you wish to regain. The well broken horse steps over promptly, instead of just turning his head and holding doggedly to his own course You are plowing and when you reach the corner of the land, you utter one word and not another inch does the plow move. You have not even tightened the lines. When asked to turn, instead of turning with the front feet only, causing the traces to pull tightly about the hocks, and the plow to turn in past the corner, the step over with all four feet bringing the plow in square on the corner. Neither do they brace against the tongue, when turning on the drill or the mower, causing sore necks and hairless legs, but step over quickly away from the tongue.

When you are unhitching or hitching up, and one horse happens to be a little too far back to allow the pole strap to be connected or be removed as the case may be, you do not have to hold the tongue and neckyoke in one hand while you get him by the bit and drag him reluctantly forward. Instead, you pull slightly on the pole strap and he steps up promptly. Dozens of similar, we may say—little courtesies, does the well broken team perform. And these things are not done with reluctance and stubbornly, but with seeming pride and pleasure. The well broken team, fear, love and obey. But no sign of fear is shown unless they know they are doing the wrong thing. They have perfect confidence in the master. They know he will never strike or punish them in any way unless they refuse to obey. This sort of team know that their master is a man who never strikes thoughtlessly, no matter what his mood.

A well broken team lightens the drudgery of farm work, both for the team and the man. The labor of working a stubborn, unbroken team, fully equals and sometimes exceeds the labor of operating the machine being used. One day we were cutting clover. The stand was so heavy and badly lodged that we couldn't tell where the sickle left off, as it was impossible to separate it. We solved the problem by putting Dick, a five-year-old gelding, on the sickle side. He could tell just exactly where to walk so we just gave him a loose line and there wasn't a hitch in the work.

The most common error in managing horses is a careless habit of talking to them. Too many words are used and the words are repeated in such conflicting terms and so often that the horses become confused and discouraged. The only thing left for them is to depend on the line. By its feel only can they tell what is wanted.

A few don't for the man who would like to have a well-broken team:

Don't say "Whoa back," when you want your team to stop. Just say "Whoa". Say it distinctly, so they may hear, and then see that they stop promptly.

When you want them to back, don't start pulling on the lines and afterward say "Back-up." Just say "Back." Say it before you pull on the lines; then if they do not back, pull firmly, but not continuously. When they have backed far enough, say "Whoa." Don't say "Get up." A little practice and it will not be necessary to pull on them at all when they are wanted to

Paroid Roofs First Laid in 1898

NEPONSET **Paroid** ROOFING

Same Roofs Still in Service

PAROID is so good that the name has come to stand for the best kind of roofing. Complimentary, but dangerous! It means that for your own protection you must look for the name Paroid on every roll you buy. Then you are sure of the roofing that is approved by the National Board of Fire Underwriters.

SAVE MONEY

Look for the Roll with the PAROID Label

Once laid, a Paroid roof is weather-proof and fire-resisting for years to come. The saving on repair bills alone ensures the economy of Paroid, to say nothing of the absolute protection to your stock and crops.

3 permanent colors—Red, Grey, and Green.

For your home, use Neponset Twin Shingles.

Look for the Neponset dealer and get genuine satisfaction.

back.

When they are wanted to start, don't slap them with the line or touch them with the whip and afterward say "Get up." Say it first and give them a chance to obey.

No man who uses the above careless manner of speech or habit of handling horses need ever expect to have a well mannered, delightful team to work. It is utterly impossible. Put yourself in the horses' place. Should your driver strike you with the whip and then tell you to get up, would you not resent it? Wouldn't one say to him: "Why did you not tell me you were ready to start?" If he gave your mouth a yank with the line and then afterward said: "Back up," wouldn't you say: "How did I know you wanted me to back?" Or would you say: "Did I understand you to say back up or get up?" In short, you would soon come to a quarrel with such a driver and would eventually balk.

Let us treat with more consideration the most noble beast we have. Let us lighten his burdens and at the same time it will lighten our own.

MORE MILEAGE FROM OLD TIRES

Many motorists using tires that have given good mileage, but have developed weak places in the fabric, have wondered whether in the interests of economy they should scrap the old tire or spend good money in an attempt to coax more miles from it. Innumerable tires are constantly being discarded before their real usefulness is over.

"Before discarding an old tire," says G. E. Brunner, a Goodyear expert, "it is well to show it to a competent repairman. He will generally be able to determine whether the expenditure involved will result in the additional mileage expected.

"Tire repairmen are not taking the long chances they once did. The dependable vulcanizer today recommends only such work as he believes will effect a saving to the motorist. If a repair is inadvisable he will not recommend it, for every job of that character means a dissatisfied customer.

"There are a number of ways in which tires apparently worn out can be made to render much greater mileage. If the tread of a tire is worn down, but the tire otherwise in fair condition, several thousand miles of service may be secured by having it retreaded. Oftentimes an inside tire protector cemented on the inside of the casing will restore or partially restore its original strength."

SALLENDERS

"Overgrown three-year-old gelding stocks in hind legs. Is in poor condition. Is turned out every fine day for exercise. Feed red top hay three times a day; oat chop, half-gallon, morning and evening; and three nights a week boiled oats and barley with crushed flax. On inside of hind legs i.e., at bend of hock joint, is very scurvy. Sore place burst and run matter. Had trouble with teeth, but these are now better.—G. M.

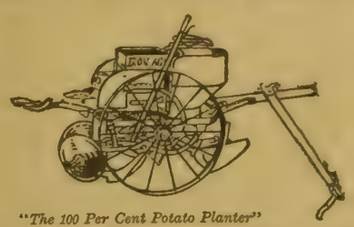
The condition affecting this horse's legs is known as sallenders, and is a form of eczema which causes a chronic scabby condition of the skin in front of the hock. Coarse overgrown horses are most commonly affected. Cases of this kind are difficult to entirely overcome, as the animal is usually predisposed and requires constant attention and careful dieting. Bran mashes should be fed every few days and a cupful of Glauber salts added to the mash. The kidneys should be kept stimulated by giving a tablespoonful of saltpetre in the feed or drinking water at least once a week. The best treatment to apply to the affected part is healing ointments, such as zinc oxide ointment.

Don't Waste the "Golden Nuggets"!

Make every seed-piece count, yet make sure of a full stand. This boy will help you do 100% potato planting, with no doubles and no misses. He will save you 1 to 2 bushels per acre—some say a barrel. He earns his way many times over. You can't afford to do without him. Use the seed-saving

IRON AGE Potato Planter

It plants as fast as the team can walk, spaces the seed evenly and at uniform depth. Has no pickers—nothing to cut or bruise the seed. Spreads the fertilizer and thoroughly mixes it with the soil so that it can not injure the seed. Can be had in two styles with or without fertilizer attachments and with choice of furrow openers.



"The 100 Per Cent Potato Planter"

Write today for booklet fully describing this 100% Potato Planter. We also make a full line of potato spraying, cultivating and garden tools.

POULTRY.

SUMMARY OF TEMPERATURE EXPERIMENTS IN INCUBATION

1. A temperature of 101-102-103 degrees, the first, second and third weeks respectively, using a standing termometer on a level with the top of the eggs but not touching them will prove very satisfactory in the artificial hatching of hens' eggs.

2. A temperature slightly above or below 101-102-103 degrees will not influence the hatch one way or another.

3. A temperature of 103-104-105 degrees is too high and will injure the hatch greatly.

4. A temperature of 102-103-104 degrees is a little high for successful incubation.

5. There seems to be little difference in number of chicks hatched between machines run at 100-101-102 degrees, and machines run at 101-102-103 degrees. This means that at such low temperatures a variation of one degree or more will have little influence.

6. Operators of incubators should endeavor to hold down temperatures below common practice, rather than allow them to rise above it.

7. Brown and white eggs need the same temperature.

8. Brown eggs are no warmer or cooler than white eggs.

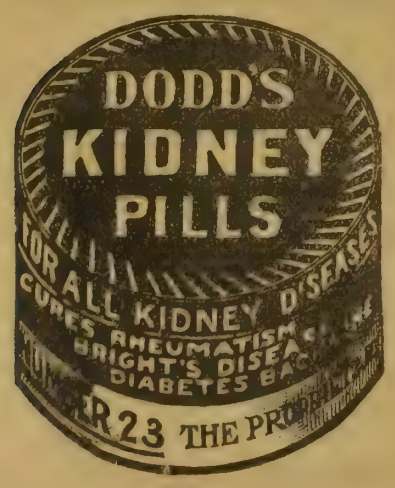
9. Brown eggs have a tendency to produce poorer fertility, more dead germs, more chicks dead in shell and fewer chicks than white eggs. No reason from the standpoint of incubation can be given for this peculiarity.

10. Under ordinary conditions it is reasonable to expect white eggs to be 90 per cent. to 92 per cent. fertile and hatch 75 per cent. of the fertile eggs. Brown eggs will run 2 per cent. less in fertility and 12 per cent. to 15 per cent. less in hatchable fertile eggs.

11. Touching thermometers average slightly higher temperatures than standing thermometers. Such differences have no influence on the hatch.

12. As the chicks develop in the eggs, they give off heat tending to equalize the temperature in all parts of the machine. This is demonstrated by the hanging thermometer. This thermometer runs at a uniform temperature for the three weeks, but the temperature at the level with the eggs, start about 2.5 degrees lower and rises until it comes within one degree of the hanging thermometer temperature on the twenty-first day.

13. A temperature with a standing thermometer of 100.5 degrees the first week, 101.5 degrees the second and 102.5 degrees the third week compares well in temperature and hatching results with a hanging thermometer temperature of 103 degrees for three weeks.—A. G. Philips, Purdue University, Lafayette, Indiana.



Raise Poultry

"There's Money in hens"

To increase the Nation's Food Supply

This is a Patriotic National Duty

10,000,000

Ten million more hens are needed to meet the home and overseas demand for eggs.

That means 15 more hens on every farm in Canada.

Raise two additional broods of chicks and let the hen help you increase production.

Every pound of food produced helps defeat the enemy.

Britain makes insistent demand for eggs at high prices.

Patriotism and profit both urge you to increase the supply.

Let the hen help you.

Interest your boy and girl in poultry keeping.

If you need information on any subject connected with poultry raising and marketing, write,

THE INFORMATION BUREAU,

DOMINION DEPARTMENT OF AGRICULTURE,

OTTAWA.

HONOURABLE MARTIN BURRELL, *Minister.*

FEED PROPER RATION IF YOU'D HAVE EGGS IN WINTER

Start now to tone up that egg machine and get it in order for maximum winter egg production, by having early hatched pullets and hens to be held over on a good stimulating egg-making ration.

The following ration is stated in parts by weight:

Wheat	20 parts
Corn	20 parts
Oats	10 parts
Bran	10 parts
Middlings	5 parts
Linseed meal	5 parts
Cut bone	10 parts
Beef scrap	5 parts

Oyster shell
Grit — Milk
Charcoal — Green feed

The nature of any ration is governed largely by the feed available, and the price. In this ration, if corn is higher priced than wheat, it can be reduced to 10 parts, the wheat increased to 30 parts, or 10 parts of ground kafir or ground barley substituted. By increasing the bran, middlings and linseed meal, the wheat can be reduced.

Unless corn is so high priced that grinding is necessary, corn, wheat and oats will constitute the whole grain to be fed morning and evening in a deep litter. During severe winter weather, corn should be fed sparingly in the morning and heavily in the evening.

Bran, middlings, linseed meal, cut bone and beef scrap will constitute the mash. This can be mixed in large quantities and fed either by the dry mash method of keeping it in hoppers before the birds at all times, or as a wet wash, moistened with milk and fed at the middle of the day.

During the coldest winter days, and also in starting the birds, the most stimulating results will be obtained if the wet mash is fed warm. Milk should be before the birds at all times. If milk (skimmed or buttermilk) is not available, the cut bone and beef scrap must be increased.

Green feed is essential. Sprouted oats give best results, but a warm room or cellar in which to grow it must be provided. Steamed alfalfa leaves made an excellent greens substitute. Cabbage and numerous other garden vegetables can be used, but the cost is often prohibitive.

Birds should have constant access to oyster shells, grit and charcoal supplied in special hoppers.—C. S. Anderson, Colorado Agricultural College, Fort Collins, Colorado.

A chick in the hand is worth 2 in the shell

To raise all your chicks—to prevent bowel trouble, drooping wings and Baby Chick diseases, use

HAD WEAK HEART

COULD NOT WORK
COULD NOT SLEEP.

Many women are kept in a state of fear of death, become weak, worn and miserable and are unable to attend to their household, social or business duties, on account of the unnatural action of the heart.

To all such sufferers Milburn's Heart and Nerve Pills give prompt and permanent relief.

Mrs. J. Day, 234 John Street South, Hamilton, Ont., writes: "I was so run down with a weak heart I could not even sweep the floor, nor could I sleep at night. I was so awfully sick sometimes I had to stay in bed all day as I was so weak. I used three and a half boxes of Milburn's Heart and Nerve Pills and I am a cured woman to-day, and as strong as anyone could be. I am doing my own housework, even my own washing. I doctored for over two years but got no help until I used your pills."

Milburn's Heart and Nerve Pills are 50c. per box, 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

HATCH EARLY FOR WINTER EGGS

One secret of winter eggs lies in early hatching. Chicks hatched not later than mid or late April will mature in time to lay eggs in the fall, when the supply is light and the prices are high. It is from such eggs that poultrymen may expect the best profits. This common fact so generally overlooked by poultry raisers, should receive more attention. The growing use of incubators makes it possible to begin the hatching season in February, bringing forth a robust flock of young chicks in March. Practically all of the hatching should be over by late April.

It is a little trouble to start the hatch so early in the season, but the experience of those who now follow this practice conclusively points out that the trouble and expense will be amply repaid. Early hatched pullets may be expected to average one egg for every five hens through the fall and winter. In some cases an average of one egg for three birds will be obtained.

Cheeks Like The Wild Rose

For all complexion ills—for Pimples and Blotches and Sallow Skin—take the one thing that will cleanse the system of impurities.....

Dr. Wilson's HERBINE BITTERS

Creams and ointments and lotions won't do it—because they only treat the skin. The trouble lies deeper—*in the blood*. Purify the blood—cleanse the stomach—regulate the Liver—and you will have a complexion like the wild rose.

Dr. Wilson's Herbine Bitters is Nature's tonic and blood purifier.

25c. a bottle. Family size, five times as large, $1. At most stores. 27

The Brayley Drug Co., Limited, St. John, N.B.

PREPARING FOR SPRING

If it has not been done before, all the old litter should now be removed and replaced with an extra large quantity of new. There is little danger to be apprehended from dirty litter in right cold weather, but when the accumulated excrement begins to soften with the coming of more moderate temperature, a foulness results which is one of the most prolific sources of canker and roup. The birds, too, transfer the nastiness on their feet to the nest, besmearing the egys and impairing their appearance in the market, for nothing can be done to a soiled efg that will fully restore its original neat appearance.

As to what to use for litter. probably a majority vote would decide for straw, yet I sometimes think a cheap quality of hay is little inferior on the whole, and has the distinct advantage of supplying many a bit which the fowls find greatly to their liking, and which doubtless add an element of "green" to the ration, of which there is no danger of an oversupply in winter. I have proved to my satisfaction, in fact, that an occasional bag of clear hay chaff, while somewhat objectionable on the ground of dust, is highly appreciated by the birds, and tends to increase yield and fertility. As someone is sure to raise the bogey of "crop bound" as a likely result of using a hay litter, I can only say that I have never had any trouble of this nature from its use. But whatever the material decided upon, be sure to have it of good length of stem as well as ample in quantity, for a tangled litter entails much more strenuous exercise than is possible with one of leaves or shavings. And in breeding season there is need of the most vigorous exercise to insure fertility and strong, healthy chicks.

Begin working the snow away from the houses, especially those situated low, lest water work in when the rains come that cannot be much longer delayed. A little moisture in one corner will soon be disseminated through the entire litter by the work of the fowls; and damp litter means sick birds. While it is not advisable, on account of warmth, to entirely bare the roofs of buildings, the excess of snow should be removed, as a precaution against a sudden violent rainfall, resulting in a collapse.

If you have not been in the habit of removing droppings frequently, get after them as soon as they begin to soften from the effect of warmer weather. They then not only exhale a most disagreeable and unwholesome odor, but the birds usually take to scratching them over, besmirching themselves as well as nests and litter.

Fowls have a yearning for outdoor with the opening of the spring feeling in the air, and while many argue that cold feet mean a lessened egg yield, I plan to get my birds out on the ground as early as possible, usually shoveling a strip bare for them to stand on. If from this they occasionally venture out on the surrounding snow, I have never found it detrimental to health or egg production.—J. L. Woodbury.

J. W. Scovil, manager of Oak Hall, St. Stephen, has offered to provide a prize of $25.00 for the best three acres of potatoes grown in Charlotte county in the coming season. This is a tangible encouragement to the increased production campaign, and one that is expressive of the donar and his progressive mercantile house.

Have you asked your neighbor to become a subscriber to the Maritime Farmer? It will not cost you any thing to do this, and we will consider it an old friend's act.

Get all the Cream with a Lily

YOU cannot expect to get all the profit from your cows unless you have a separator that skims clean. Why don't you make up your mind now to buy a **Lily** cream separator, for the **Lily** skims so close that it leaves hardly a drop of cream in each gallon of skim milk.

Besides saving money, a **Lily** separator saves a lot of work. It can be kept perfectly clean and sanitary with five minutes' work after each separation. The oiling is automatic. Renew the oil about once a week; fill the chamber to a plainly marked level, then every bearing is oiled by the spray from the spindle drive gear. Nothing could be simpler.

Buy a **Lily** separator. It skims clean. It is easy to care for. It oils itself. It turns easily. It takes up little room in the dairy. It is a safe, sound, well-made machine, easily kept in perfect working condition. A responsible Company stands behind it. You can't get a better cream separator.

Even though you are not in the market for a separator today, drop us a line so that we can send you full information about this high grade machine. It may save you money.

SPRING.

Jean Blewell.

Oh, the frozen valley and frozen hill
make a coffin wide and deep,
And the dead river lies, all its laughter stilled within it, fast asleep.

The trees that have played with the merry thing, and frightened its breast with leaves,
Give never a murmur or sigh of woe—they are dead—no dead thing grieves.

No carol of love from a song-bird's throat; the world lies naked and still,
For all things tender, and all things sweet, have been touched by the gruesome chill.

Not a flower—a blue forget-me-not, a wild rose, or jasmine soft—
To lay its bloom on the dead river's lips, that have kissed them all so oft.

But look! a ladder is spanning the space 'twixt earth and the sky beyond,
A ladder of gold for the Maid of Grace—the strong, the subtle, the fond!

Spring, with a mantle made of the gold held close in a sunbeam's heart,
Thrown over her shoulders bonnie and bare—see the sap in the great trees start!

Where the hem of this bowing garment trails, see the glow, the colour bright,
A stirring, and spreading of something fair—the dawn is chasing the night!

Spring, with all love and all dear delights pulsing in every vein,
The old earth knows her, and thrills to her touch, as she claims her own again.

Spring, with the hyacinths filling her lap and violet seeds in her hair,
With the crocus hiding its satin head in her bosom warm and fair;

Spring, with the daffodils at her feet and pansies abloom in her eyes;
Spring, with enough of God in herself to make the dead arise!

For see, as she bends o'er the coffin deep—the frozen valley and hill—
The dead river stirs,—ah, that lingering kiss is making its heart to thrill.

And then as she closer and closer leans, it slips from its snowy shroud,
Frightened a moment, then rushing away, calling and laughing aloud!
The hill where she rested is all a-bloom, the wood is green as of old,
And wakened birds are striving to send their songs to the Gates of Gold.

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Address

WOMENS INSTITUTES IN CANADA

The following article written by The Viscountess Wolseley and published in the January, 1916, number of "THE ENGLISHWOMAN" will be of great interest to Women's Institute members who read this page.

"In considering the Women's Institutes, which in Ontario alone possess nearly twenty-five thousand members from amongst eight hundred and forty-three branches, it must be confessed that in energy, perseverance, and a true grasp of the requirements necessary to stem the rural exodus, Canada has far surpassed the Motherland. Her women are giving the best thought and many hours of work, not only to remedying weakness that already exist, but, like true pioneers, they are looking in the future. They see before them additional difficulties when the Great War is ended; they know that then many conditions will alter, more women will have to earn a living, fewer men will be there to work, a large number of strangers will go to live in Canada, and therefore they must now safeguard their country, keeping it Canadian and British, remembering always that unity is strength.

"They are not leaving these questions to settle themselves or postponing work that they hope to complete; they long ago laid a solid foundation, and it is only necessary now for them, during these anxious months of waiting, to add propelling force to machinery which is already in existence. It is, I feel sure, a mere question of making their work known, of pointing out how necessary it is for us to copy so brilliant an example, and the daughters of England will rise up and follow upon similar lines in an endeavor to improve social and educational matters in rural districts.

Very far-reaching is the influence exercised by women, for only in so far as a country reverences its womanhood does it attain permanent greatness. If its ideal type of woman is a high one, morals are pure and a noble standard of conduct is the result. We hear how the women of Germany are at the moment, fired by patriotism and a sense of dangers that surround their Fatherland, strenuously undertaking munition work, tilling the land, bringing in the harvest, studying economy in their homes. All this is fine work that they have carried on since the outbreak of war, and, owing to the strong leadership they are given, the detailed plans of their exceptional Government organization, they have merely to obey orders and carry out, with industry, what they are told to do. We cannot fail to confess admiration for this regulated and well-ordered effort of our enemy, but is there not all the same a lack in them of higher, nobler influences?

"If we want proof of how much diplomatic negotiations may be influenced by women, we have only to turn to Bismarck's Memoirs, where we find irritation expressed at the milk measures so continually thrust in the way of this exceptionally strong man, owing to views that were urged by those whom he called "politicians in petticoats." Again, whilst the Siege of Paris was in progress in 1870, when it became dangerously protracted as regards eventual success for Germany, and Bismarck recommended that bombardment should take the place of siege in order to hasten victory, the Empress Augusta and her Court ladies exercised their powers of persuasion to frustrate his wishes. We are told, "The secret of it all is that the Empress with ideas that she has got from England, cant ideas as to "humanity" and "civilization," prevents us from carrying through our military measures as we ought to."

"These facts, coupled with the deplorable cruelty shown by Germans in the present war, show plainly how quickly a nation's culture and civilisation may revert to barbarism unless care is exercised in spreading high standards and lessons of humanity amongst the young. In order to influence character and increase noble ideals amongst boys and girls, it seems all-important that both men and women should work together upon Educational Committees and in those assemblies that are concerned with what they share together in public life.

"We women, on the other hand, fully appreciate how many things there are that a man alone can do, but so candid, an acknowledgement does not prevent the certainty that in the discussion of most public questions concerning men and women workers, more especially those that deal with education, women should be, and in many cases are, welcomed by men, for the views of both are essential to a just and wise decision. There is one thing that a man cannot make for himself, and that is a home; and here, again, in all that bears upon the family, its upbringing, food, clothing, housing and social conditions, it is the woman who bears the heavier burden, and therefore she can best help decide about such matters.

"The women of Canada have, for a long time, been in the forefront of advancement and probably they owe much of their claim, non-hysterical way of dealing with public questions to the teaching of Mme. Peltrie and others, who, sacrificing their happy homes, gave up all to go out to Canada in order to train and educate young settlers of the colony. The forethought and resourcefulness of these pioneers were transmitted to those who followed after, and these qualities, together with simple social conditions that prevail where people live by the work of hands and brains, free from over-engrossing distractions that luxury brings in its train, have helped to evolve modern Canadian women.

"Marked progress was made by them about fifty years ago, when to the astonishment of their less go-ahead sisters in England, they started a Women's Club in New York City, where discussion of all public questions could take place. Long after this, the foundation of the Women's Institutes was laid, and broadly speaking they form in rural districts a meeting-place somewhat similar to town or suburban clubs, where women of all spheres of life unite for instruction, friendly discussion, or recreation. I shall endeavour to give an account of their origin, the aims that were at first kept in view, how these have expanded to such a degree that they now have created far-reaching national results. Although social conditions and intercourse between people who belong to different spheres of life are mistakenly complicated in an old country like England, hopeful signs are now evident that improvement and simplications of these conditions are likely to take place, and therefore much, that this Canadian work has brought about, could doubtless be copied and utilised by us. How it can be done, and which of our many energetic women will best carry out the scheme, can alone be decided when we know the full value of what is progressing in Canada.

"A great organization often has but a humble commencement and this was the case with Women's Institutes. As recently as 1897, a small band of women met in a village and, under

ELDERLY WOMEN SAFEGUARDED

Tell Others How They Were Carried Safely Through Change of Life.

Durand, Wis.—"I am the mother of fourteen children and I owe my life to Lydia E. Pinkham's Vegetable Compound. When I was 45 and had the Change of Life, a friend recommended it and it gave me such relief from my bad feelings that I took several bottles. I am now well and healthy and recommend your Compound to other ladies." —Mrs. MARY RIDGWAY, Durand, Wis.

A Massachusetts Woman Writes:

Blackstone, Mass.—"My troubles were from my age, and I felt awfully sick for three years. I had hot flashes often and frequently suffered from pains. I took Lydia E. Pinkham's Vegetable Compound and now am well." —Mrs. PIERRE COURNOYER, Box 239, Blackstone, Mass.

Such warning symptoms as sense of suffocation, hot flashes, headaches, backaches, dread of impending evil, timidity, sounds in the ears, palpitation of the heart, sparks before the eyes, irregularities, constipation, variable appetite, weakness and dizziness, should be heeded by middle-aged women. Lydia E. Pinkham's Vegetable Compound has carried many women safely through this crisis.

NEEDS NO PAINTING

Amatite stands alone in the ready roofing world. It is the one roofing you don't have to paint. Once laid, it will last for years without any attention from you. For sidings and steep roofs it is supreme. If you could only see how it is made—see the tough, fibrous felt, the dense, non-volatile saturating compound that keeps it water-tight, you would understand our claims. Try some.

A Roofing Triumph

The durability of Amatite is only one of its five points. The same structural feature which makes it unnecessary to paint Amatite, gives it a distinctive and beautiful appearance. We refer to its sparkling, mineral surface. Improves the appearance of any building. The best buy in the ready roofing market.

Carrite-Paterson Mfg. Co., Limited
Halifax, N. S. St. John, N. B.
Sydney, N. S.

direction of one of their number, it was arranged that they should hold monthly meetings in order to discuss household affairs, exchange cooking recipes and mutally help each other by giving advice upon domestic matters. From this sprang a network of branches, and in Ontario along the result has been that some thirty thousand women and girls are closely connected with the work, because twenty-four thousand homes are represented by one member from each, and besides these, every household has several women belonging to it, who although they are not members, may attend meetings. Having commenced in Ontario and made rapid progress there, the work gradually spread to other Provinces, and in some of these the branches are known as 'Home-makers Clubs.'"

Teachers and organizers trained in Ontario are now to be found carrying on the work in distant Provinces, each one of which is represented, and knowledge of it is further extended by classes and demonstrations that are given for the benefit of young women and girls, who are not necessarily members, but who often become so much interested that they eventually join the Institutes.

"A very considerable degree of success has been obtained as follows:

1. "The origin was humble, but the scheme being well laid and its supporters industrious and active, the work has increased steadily.

2. "The Governments of the Provinces give liberal financial support, and hold out every encouragement to this splendid organization; besides this, the Department of Education lends books of fiction, instruction, and biography to the Institutes by means of Travelling Libraries. Great stress should be laid upon the advantages to be obtained from Government assistance, for so often admirably planned schemes fall to the ground because voluntary workers have not sufficient capital with which to support them for any length of time. There is a central organization of rural Women's Institutes in almost every Province of Canada supported by the Department of Agriculture, and, in the case of two Provinces, by the Provincial Universities. This central organization arranges for branch Women's Institutes in all parts of each Province, with especial success in rural communities. The branch Women's Institutes, once well started, manage their own affairs, and do what work seems to their members best suited to their locality, with due regard to certain general principles and procedure defined by the Rules and Regulations. They are registered by the Department of Agriculture and receive certain money grants and assistance for which they comply with the requirements of the Acts of Parliament under which they are registered. Although there must necessarily therefore be official supervision in some measure, there is not too strenuously enforced, because the Government realize that the life of such an organization must depend upon its adaptability to local conditions, and they allow the Institutes to work out their own plans provided the money is spent in line with aims and objects. Generally speaking, the central organization of the Department of Agriculture, whether it consists of an Advisory Board or of certain officers of the Department, provides literature, some assistance in money, arranges for demonstrators and lecturers for Branch meetings, pays a fee to Branch Secretaries, supplies stationery, drafts rules and regulations, co-operates in educational, agricultural, exhibition and other work, and is ready at all times to give advice and help to the Branch Secretaries. In this way a sympathetic connection is established with the Department of Agriculture or the University Schools of Agriculture and Home Economics.

3. "Women's Institutes do not work in a narrow grove. The wonderful thing about them is that rich and poor mingle together and work in perfect harmony; people from town and country, those who belong to all creeds and denominations, are brought together. Many who formerly interested themselves in some small Church aid work, have become members in order to avail themselves of a wider scope of helpfulness. By co-operating with Farmers' Institute and Farmers' Clubs, all social gatherings, debates, and entertainments become more effective, and a wider outlook is obtained. The Farmers' Institute represents all connected with food-production, and the Women's Institute bears upon the welfare of people in those matters which concern both old and young women, and so it will be seen that the combination of the two classes of work covers much which concerns rural life.

"Having in early days only embraced cooking, housework, the physical welfare of the child, sanitation, and those things that are included in rbinging up a family, the Women's Institutes have now adopted 'Home and Country' as their motto, and include in their discussions questions which relate to community improvement and nation building. They started with those things which bear upon the child and its growing days, and now they form a propelling force not only to boys and girls, but also to men and women.

This Washer
Must Pay For Itself

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right, but pay me first, and I'll give you back your money if the horse isn't alright."

Well, I didn't like that. I was afraid the horse wasn't "alright" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

Our "GRAVITY" design gives greatest convenience, as well as ease of operation with quick and thorough work. Do not overlook the detachable tub feature.

But I'd never know, because they wouldn't write and tell me. You see, I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that without wearing the clothes. Our "1900 Gravity" Washer does the work [illegible] as a strong woman, and it [illegible] fray the edges nor break buttons, the way all other [illegible]

It just drives soapy water [illegible] the clothes like a force [illegible]

[illegible] do with my "1900 Gravity" [illegible]

[illegible] first, and I'll make good the [illegible]

Let me send you a "1900 Gravity" Washer on a [illegible] the free use of my own pocket, [illegible] want that [illegible] take it back [illegible]

[illegible] "1900 Gravity" Washer must be a [illegible]

And you can pay me out of what it saves you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will [illegible] over [illegible] If you keep the [illegible] let you pay for it out of what it saves you. If [illegible] cheerfully, and I'll wait for my money until the machine [illegible]

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

State whether you prefer a washer to operate by Hand, Engine Power, Water or Electric Motor. Our "1900" line is very complete and cannot be fully described in a single booklet.

Had Pneumonia

DR. WOOD'S NORWAY PINE SYRUP CURED HIM.

A cough is an early symptom of pneumonia. It is at first frequent and hacking, and is accompanied with a little tough, colorless expectoration, which soon, however, becomes more copious and of a rusty red color, the lungs become congested and the bronchial tubes filled with phlegm making it hard for the sufferer to breathe. Males are more commonly attacked than females, and a previous attack seems to give a special liability to another.

On the first sign of a cold or cough you should get a bottle of Dr. Wood's Norway Pine Syrup and thus prevent the cold from developing into some serious lung trouble.

Mrs. E. Charles, North Toronto, Ont., writes: "Two years ago my husband had a very bad attack of pneumonia, and the doctors said he was getting consumption. A friend came in to see me and told me to get Dr. Wood's Norway Pine Syrup. I got three bottles, and they seemed to quite clear his chest of the phlegm, and now he is fine and well.

I shall never be without it in the house as it is a very valuable medicine."

Dr. Wood's Norway Pine Syrup is put up in a yellow wrapper; three pine trees the trade mark; price 25c. and 50c.

The genuine is manufactured only by THE T. MILBURN CO., LIMITED, Toronto, Ont.

At their meetings, all public questions such as Civic Improvement, School Inspection, the laws and by-laws which regulate the morals and welfare of the community are discussed. These are naturally of intense interest to the mother of a family, because their eventual development must affect her children and their future families. Likewise, when the material prosperity of boys and girls, men and women, together with their mental and moral welfare is established, there can be no fear of agricultural depression, because workers will remain happily in their country homes instead of drifting towards the towns, and this is what the Women's Institutes have prevented.

"Let us now see how they achieve still more by means of co-operation. They are helping the intellectual life of the rural districts by making country life more attractive to young men and women, thus retaining those who can cultivate land and ensure a good food supply. Where there is lack of cultivation there is scarcity of food, and this is one of many dangers that the Rural Exodus brings about.

"A few rules and regulations exist, but red-tape does not prevent invididual development and scope for invention. Thus each village or small town community can spend the accumulated subscriptions of its members upon anything that will add to the general welfare of the neighborhood. Some may commence with a room or building to be used for meetings, not only those held for the Women's Institute, but others as well. Whatever is paid by other societies for the hire of this room goes towards future purchases of chairs, tables, books, or newspapers, a piano, or any other things that will make it a comfortable club for women. For instance, we read of a hall and four adjoining rooms having been rented, and that it was possible also with the subscriptions (which it must be remembered come from rich and poor alike) to arrange for a woman to act as matron. She lived on the premises, and was able to see to the lighting and keep it comfortable and warm for the use of members. On weekdays it was open from 9 a. m. until 10.30 p. m.; and on Sundays for a shorter time. Each member was asked to contribute one piece of furniture, and so gradually it was made home-like, and rugs, pictures, a writing-desk, sewing-machine, piano, and many other things were procured. People in larger houses sent their papers down in the afternoon, and other literature was provided by Government.

"One of the problems of country life is how to keep young people amused; a village hall is a great help in making them satisfied with their quiet surroundings. Concerts can be given, and old folk-songs revived; then, too, demonstration lectures upon food values, cooking and sewing are so easily arranged for, if there is a room available. In England we are only now commencing this work of instruction in domestic science, and until we can teach people to help themselves, and inspire women with a wish to make a real study—a profession, in short—of housekeeping, we shall continue to have a dearth of good plain cooks, which becomes increasingly noticeable each year. Lady Chance, the principal organizer of the National Food Economy League, a society which was started in London at the outbreak of war, has been endeavouring to remedy this. She is publishing admirable booklets, to be obtained for 1d each, in which are given recipes for simple dishes, suggestions for utilizing vegetables, and hints as to how waste can be avoided. If this society had for its support some local organizations similar to the Women's Institutes it would make rapid progress, but often those who have been anxious to make use of its instructors and have demonstrations are prevented by lack of suitable village accommodation or scarcity of funds.

"Whenever information can be supplied which bears upon the practical

Took Friend's Advice And Got Results

HOW M. C. LINDOS FOUND A CURE IN DODD'S KIDNEY PILLS

One of the Reasons Why Dodd's Kidney Pills Have Had a Phenomenal Growth of Popularity in the West.

Ellscott, Alta., April 5th—(Special.)—The growth of popularity of Dodd's Kidney Pills in this section of the Great West has been phenomenal. They cure kidney disease. That much has been proved again and again. One of the latest proofs comes from M. C. Lindos, well known and highly respected here.

"Thanking Dodd's Kidney Pills seems a small way of expressing my gratitude." M. C. Lindos states. "I suffered from headaches and dizziness and was unable to find anything that would do me any good. I tried several medicines that were advertised to cure my trouble, but they did not.

"Dodd's Kidney Pills were recommended to me by a friend and I sent for a box and gave them a trial. The result is that I am feeling fine now. I shall always keep a box of Dodd's Kidney Pills handy."

Dodd's Kidney Pills cured M. C. Lindos because the trouble came from the kidneys. Lumbago, rheumatism, dropsy, heart disease, diabetes and Bright's Disease are other troubles that come from sick kidneys. To cure them cure the kidneys with Dodd's Kidney Pills.

INSTEAD OF PAINT

DON'T paint your pretty home this season, but use instead Velvex Creosote Shingle Stains. By so doing, you can bring out all the beauty of the wood. And think of the preservative value. Velvex Shingle Stains contain Creosote, the greatest wood preservative known. This means prolonged protection against wind and weather. It therefore means economy.

Velvex
Creosote Shingle Stains
Half the Cost — Twice the Wear

Velvex Creosote Shingle Stains cost about half as much as paint. And they wear much better because they penetrate the wood. They do not evaporate or dry out and of course they cannot peel off. These stains come in any color you want. They are very easily applied. You ought to investigate them. We have the complete line and we know you will like them.

Write us for a sample of wood stained with Velvex Creosote Shingle Stain.

side of life, it is so helpful, for it means that the last and best word of experts is brought within reach of country cottages. We know that in farmnig and gardening, if the best methods and the latest theories are followed there is a gain of increased production. In the same way that this applies to a greater yield of wheat or a larger supply of live stock, so does it help women in their housekeeping if they are directed as to labour-saving methods, have information as to food values, rules of health, comparative values of wearing apparel brought clearly to their knowledge. This need not be done in a dull, dry way, but if the lecturers are well selected, and add a spice of fun or humour to what they say, many will be glad, after a long day's work, to walk across the village street, or even come from distant farms through moonlight fields, to sit in a warm, bright village hall and join in the interest of discussion. Those women of our upper classes who spend, perhaps, only week-ends in the country, or who pass a few months in a large house which they frequent during a fixed time of year for hunting or shooting, can hardly realize the loneliness of life on a farm or in a cottage. The farmer and the working man have interests outside the home; they have friends who they can walk over to smoke a pipe with, or a village club, where they can read the papers after work hours; but for womenfolk no amusements are provided. Upon them falls the daily task, which often from its sameness grows monotonous, of providing food and cooking it; then there is jam-making, perhaps break-baking, and the weekly wash-day. But is there any fun to be had withing going as far as the neighbouring town to see the cinema? Is there much beyond Sunday's sermon from the pulpit to give food for though of things beyond the parish boundary line? There is nothing specially provided for the relaxation of these women, and it is because of this that so many young girls prefer to leave their homes and gain a wider swain, Harry the ploughman or Bill the carpenter, and so the countryside becomes depleted of its men and women.

"It is most natural that those who live surrounded by luxuries, such as electric light, telephones, carriages and motors, who have easy means of access to the best plays, concerts, and dances, who have brought to their doors all the latest ideas on music, literature, and science, do not understand the stagnation, the dreariness of country life, when all these means of communication are wanting—when the farmer's wife cannot even take her share in the affairs of the county or in educational matters. It is this social side, a personal element, far removed from politics or pettiness of party gains, that the women of Canada have helped so much. They know that a single unit can accomplish but little, so by means of co-ordinated work, the combined assistance of all towards some one specific object, they accomplish things that surprise by their importance. Sometimes a village President gives a tea-party to show off the beauties of her garden, and a small entrance fee being charged to all who attend, it is possible to collect money to help an invalid child, or, if local benefits are desirable, then a swimming-bath and dressing-rooms are built, or a sewing contest for girls, with prizes, is organized, a public library is started, or singing classes, with a choral leader, to stimulate music in the village, are undertaken. These are only a few of many ideas that we read of as having been successfully carried out by means of co-operative effort. One very favourite form of contribution towards the life of the community is a public garden, planted with trees, gay with flower-beds, and having shadowy, sheltered nooks for seats, children's playgrounds, and tables and chairs for picnic parties.

"I am told that wonderful moral forces have been brought out by this unity of rich and poor, old and young women, people of all beliefs and ideas. Petty jealousy has vanished, narrowness of thought, severity of judgment have disappeared, and charitable, broadminded views are disseminated. Much depends upon the selection of office-bearers and, of course, choice of a suitable President is particularly important. She must, amongst other qualities, possess that one

CHAMBERLAIN'S TABLETS

SORE THROAT AND TONSILLITIS

The ordinary sore throat is not a true disease, but rather a symptom of some derangement of the body. Usually the throat means that portion located between the angle of the jaw and the collar bone. This portion of the passage is lined with many kinds of ducts and glands, whose function it is to supply many needed ferments. It contains the salivary glands that give off a dgiestive ferment which becomes mixed with the food in the process of chewing. The next most important structure are the tonsils, which are noted for their ability to become infected. In the process of eating these glands and tissues are brought into close contact with infections, by the pressure of swallowing the food. Other sources of danger of infection are from the dust in the air and the hundred-and-one things which get into our mouths through carelessness and bad habits. Children especially misuse their mouths by putting any and everything into them, and especially do they loll and chew their fingers. Most of us have witnessed a parent—or have been guilty ourselves—of picking food or candy from the floor, after it was moist from saliva, and consequently would easily become covered with germs, and giving it to the baby. How often do grown-ups go to the table with unwashed hands, regardless of what germs may be taken with the food? Moistening the pencil point and touching the thumb to the tongue to turn a page are loosing cast, but it is a common habit of persons who think themselves very hygienic, to hold in the mouth such things as pins, pencils, hairpins, hatpins, strings, nails—in fact, anything and everything may go into the mouth. Everyone of these things are covered with germs of the worst infection, and while these are little things in themselves, they expose you to infections and sickness which might have been avoided. Nor do these habits add to one's refinements, but rather tend to corrupt the aesthetic nature. As evidence of how important these little things really are, I recently saw a book-keeper who had developed arsenic poisoning from wetting his finger on his tongue to turn the pages of the ledger. Of course, this kind of poisoning does not kill immediately, but produces nerve and muscle changes which torment the victim, just as do the little infections of the throat produce pains and aches in distant parts of the body. Trades-poisoning from breathing dusts in the factories are very common in the industries, and while few of my readers may suffer in this way, it would be well for those who have orchards, and who spray their trees, to beware, lest they suffer injury.

Probably the best known of all the tissues of this section are the tonsils. Located on each side of the throat they are in good position to receive the infecting germs, as they pass during the act of swallowing food. Unfortunately they do not destroy these germs, but rather, owing to their spongy formation of tissue, they afford protection for them. The tonsil is very cellular in structure, having one or two dozen little crypts or tubes leading deep into the gland.

Once the germs find lodgment in these crypts, it is impossible to get them out by disinfecting solutions, because the medicines which will destroy the tissues are not sufficiently strong to destroy the germs, so that the cure becomes worse than the disease, and by irritation of the parts the germ growth is intensified. It is in these pit-like openings that the infection remains long after the disease has seemingly disappeared. These pockets in the tonsils protect the germs in persons know as "carriers"—that is, persons who spread disease, but are not sick with it. This is especially true of diphtheria, and the diphtheria germs often remain in the throat for long periods of time after recovery from the disease.

But all attacks of sore throat do not involve the tonsils, nor are all of them of microbic origin. Some are not catching in the beginning of the attack, but the germs soon find a good foothold in the inflamed tissue, and complications arise. People who are rheumatic in tendency are subject to sore throat, and for want of a better name it is called rheumatic sore throat. It is usually found in people who live high and get little fresh air and exercise. This sore throat is not catching, although almost every other inflammation of the throat is contagious, and especially those of early childhood. The dangers of contagion in these throat affections are difficult to avoid, because they are scattered about by handkerchiefs, coughing, spitting, blowing the nose, and from the particles of saliva which are expelled from the mouth during conversation.

Repeated attacks of tonsillitis thicken the tissue, and the tonsil soon becomes large and fibrous. The natural pores and openings in them become large and twisted, so as to make a better harbor for germs, and this is intensified with each cold, going from bad to worse, until the tonsils actually destroy the health. I have seen many instances where removing the tonsils made a new person of the victim. However, I cannot subscribe to the general slaughter of all tonsils. While there is no known good derived from them, we are not justified in removing them without cause.—(Julian Clarke, M. D. in N. E. Farm and Home.

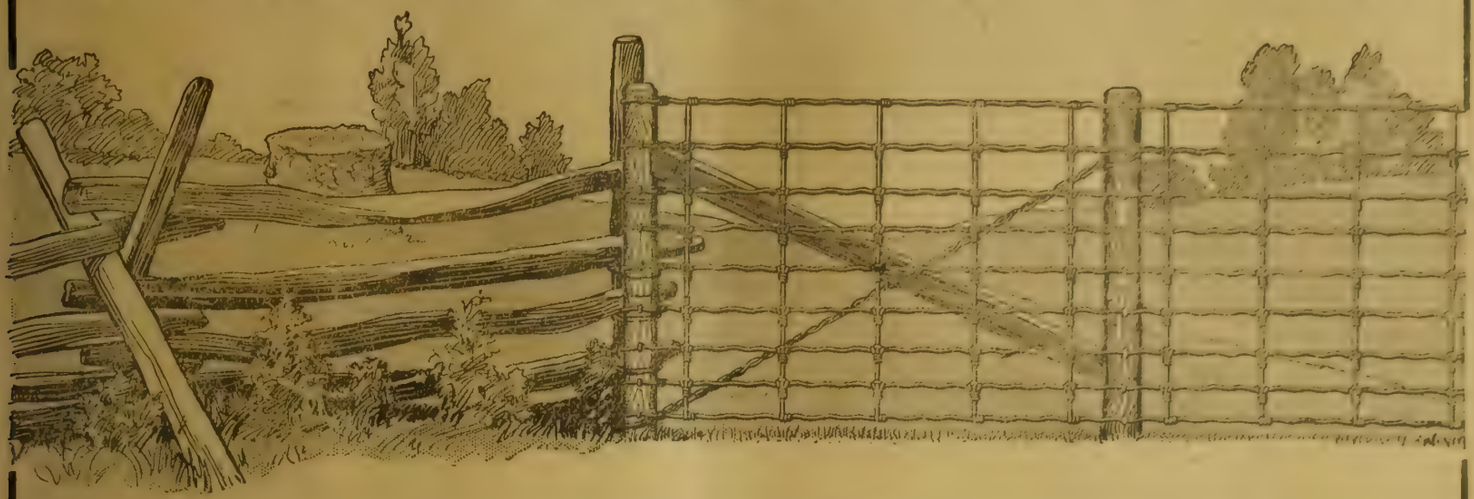
Let FROST FENCE Replace Your Rail Fences



EVEN yet, one sees a great many old rail fences throughout the country. These old-style "snake" fences right at the present time use up hundreds and hundreds of acres of ground, which might otherwise be put to good use.

JUST examine carefully the above picture, and do you not wonder how it is possible that these rail fences are still throughout the country, when neat, land-saving and substantial wire fences can be erected for such a reasonable amount. If, on your farm, you have any fields not fenced in the improved way, will you not consider seriously the question of putting up a nice wire fence?

FROST FENCE FIRST

YOU will notice the illustration of the FROST HOLD-TIGHT LOCK. This is the binding or lock used where stay wires cross laterals. This lock is much superior to any other woven fence lock, and holds securely without kinking the lateral of running wire, thus weakening it. There is only a slight kink in the stay wire, and the general appearance is as neat as could possibly be wished for.

The FROST "hold-tight lock"

If you have not examined this lock closely, we will be very glad to send you sample, so that you may put it to some good hard tests.

FROST FENCE is all completely made in our own mills. We are responsible for it from beginning to end, and when we tell you that there is quality in the wire and the workmanship we are entirely responsible.

You will find a made-up fence just as neat in appearance as shown in the above illustration, and the lasting qualities are there also, in fact, FROST FENCE will stand wear and tear that would rip other makes to pieces.

We have a full line, not only of woven wire fences, but all wire products, as well as farm gates and ornamental gates; also fancy fences made from woven wire or angle iron. If you do not know a near-by agent, kindly get in touch with us direct.

TEN HEALTH HINTS

"1. Eat plain, wholesome food and eat slowly. The more your teeth work the less your stomach works.

"2. Drink at least six glasses of pure water each day. If you are in doubt about the water being good, boil it.

"3. Get enough sleep. The average adult should have not less than eight hours sleep in a well ventilated room. Don't sleep in clothing that has been worn during the day.

"4. Clean your teeth twice a day with a stiff brush. If your teeth are decayed, go to a dentist. Money spent in this way is well invested.

"5. Frequent baths with soap and warm water keep the skin clean and the body healthy.

"6. Always have one or more windows open day and night, winter and summer. Dirty air kills more people than dirty water, dirty milk and dirty food.

"7. If you are tired, it is rest that you need. Avoid whisky and other intoxicating drinks; they weaken both mind and body. If you need a stimulant, try hot coffee.

"8. Don't spit on floors, sidewalks, or in cars. Use the cuspidor.

"9. Do not use the public drinking cup. Disease is spread in this way, as you never know what disease others had who have used this same cup. The bubbling fountain is always safe.

"10. Don't neglect coughs or colds. If you do not recover as quickly as you should, see a doctor or go to a dispensary for advice or treatment."—Dr. W. A. Evans, in the Chicago Tribune.

WHAT CAUSES HEADACHES?

Most headaches come from improper foods, drinks, and eating too rapidly.

Others are the result of overstraining the eyes—of not wearing glasses when they are needed, or from bad mental habits, such as worry and indecision.

There is a cause for every headache. The cause for each case must be sought out.—Louisiana State Board of Health.

McLAUGHLIN CARRIAGES

are undoubtedly the highest grade Carriage ever put on the market by any manufacturers in Canada. Their policy—one grade only and that the best—is as firmly adhered to now as in the past.

We want Agents in all localities where the goods are not now sold. Perhaps you would like to act as our Agent.

If you would like to purchase one of our Carriages this season and there is no McLaughlin Agent near you, write to

H. A. AMOS, - - - Oxford, N. S.

General Agent for New Brunswick and Nova Scotia

WOMEN'S INSTITUTES IN CANADA

(Continued from page 369)

essential of those who guide others, a power by which the best that is in each worker is not only discovered, but increased.

"When the right President has been found, her first consideration will be, after she has appointed a working staff, to give each member of it some one work to direct. It is only by allowing workers responsibility, subservient always to a broad degree of discipline, that an interest in their special departments is created and maintained. In this way all activity will become both pleasant and profitable, as each member knows that she is answerable for the success of her special undertaking, and puts the whole strength of her ability into her work.

"In Canada, where social conditions are simpler than with us, it has been found advisable to bear in mind, in selecting office-bearers, that no one must be chosen because she is Mrs. So-and-So, but solely upon her own merits. It is only because she is clever, possesses energy or qualities of tactfulness, that she is asked to help officially. In this way no distinction of class or creed is permitted, and consequently all friction or trivial discussion is unheard-of.

"When women's meetings are first introduced into a village or small community, it is difficult sometimes to draw out the talent or personality which most assuredly lies hidden in each member. For this object a roll-call is used, and is printed on the programmes, giving thus an opportunity for each member, however shy she may be, to join in the meeting. Each is expected to respond either with a verse of poetry, a recipe or kitchen hint, as the case may be. In this way those who are retiring, and perhaps over-modest, are encouraged to express their opinions.

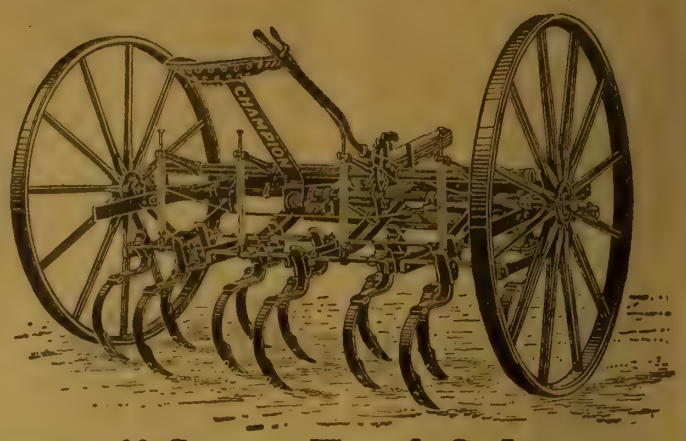
"Another important development which owes its progress to Women's Institute meetings is the interest given to agricultural and other local and home industries for women. Canada has many years been aptly called, 'The bread-basket' of the British Empire, and, in order to retain this reputation, she has this year to augment her efforts for increased food-production. Not only must she feed her own people and us, but she has to provide for those at the front. Her women enter with energy into all business transactions of the men, and consequently the wives of land-owners, farmers, growers, and producers follow each step that is now being taken vigorously to add to the yield of land. They know the full value of co-operation in agriculture, and appreciate much more than we do in England the assistance that is gives to growers. In one of the Institutes, women recently availed themselves of the generosity of the farmers, who allowed them to pick up all windfall apples in their orchards. At one of the old-fashioned 'paring bee' meetings the apples were peeled, and the result was that in one evening fifteen bushels were ready to be dried. The manager of a neighboring fruit factory generously offered to dry the fruit, and, given this incentive, the women managed in six evenings to pare six hundred bushels, which, when dried, were sent to the Belgians. This is a proof of what co-ordinated workers can do.

The above is only a brief outline of valuable progress that is being made across the waters to make country life assume the high position it should take in every country, and which women can effect so materially. Those who wish for further particulars will obtain them from the Agricultural Organization Society, Queen Anne's Chambers, To thill Street, Westminster, S.W., for its members are taking an active part in the movement for forming Women's Institutes in England. They have obtained the valuable assistance of Mrs. Watt, the Secretary of the Advisory Board of Women to the Department of Agriculture in British Columbia. Much of what I have described and a great deal more besides, was told in a lecture by this charming Canadian lady, and the moral of what she imparted is perhaps best found in the words of our King, who said, "The strength of the Empire lies in the homes of her people.'"

Mrs. Watts has met with great success in spreading Institutes throughout England, upwards of thirty having been organized up to October, 1916. In several instances the officers are titled ladies. Miss Morris, daughter of the poet-craftsman, William Morris, is the President of the Oxfordshire Institute. At the organization meeting of the Institute at Wallisdown, the first woman in the audience who spoke in favor of it did so because, as she said, "A Women's Institute in Sandy Bay, Ontario, was good to my boy when he was stationed there as a soldier and I should like to join one here." In writing of her experiences, Mrs. Watt says, "Greatest of all has

The Labor-Saving "CHAMPION"

This is one of the most popular of the Frost & Wood Cultivators. Its best friends are the farmers who give it the hardest work.



IT'S A PLEASURE TO USE IT

You know its going to do the work just as you want it done, without annoying delays for adjustments or repairs.

The Frost & Wood "Champion" Spring Tooth Cultivator

Helps you get a splendid seed bed with the least possible labor. Each spring tooth section works independently of the rest (so that uneven land is thoroughly cultivated) but all are controlled by one easily-worked pressure lever. Frame is of heavy steel, helper springs and teeth are extra fine-tempered spring steel; you can easily make it into a Broadcast Seeder, too, with grain and grass seed boxes, and get positive feed and splendid results.

For cultivating, we can supply both 2 inch and 7 inch points—the 7 inch make splendid thistle cutters. It's an immensely strong, light-draft implement that LASTS.

Write us for a Catalogue today, or drop into the nearest Frost & Wood agency and get intelligent advice on all your implement needs.

been the deep warm feeling of gratitude in English hearts to Canada. They are willing to shatter the old prejudices to try something "Canadian", and in so doing they are building up a new and better Empire."

SOME GOOD ADVICE FOR YOUNG MOTHERS

Twelve "Don'ts" Which if Obeyed Will Safeguard the Baby

1. DON'T give a baby a "pacifier" of any sort under any condition. It forms bad habits for the baby, spoils the shape of his mouth, causes indigestion, may cause growths of the nose, and throat, and, most important of all, it gives the child an unlimited opportunity to swallow all kinds of dirt and germs.

2. DON'T leave a baby in his carriage or anywhere else with his eyes unprotected from the glare of the sun. Direct sunlight is most injurious to a child's eyes. This should also be guarded against in wheeling a child on a sunny day.

3. DON'T lift a baby by his arms, or pull an older child up the steps or along beside you by one arm. An actual dislocation may be caused in this way, and there is always the danger of grave injury to the ligaments of the wrist and shoulder joints.

4. DON'T let a baby put anything in his mouth if you can possibly prevent his doing so, especially anything which he may have picked up from the floor. He may choke himself, and most certainly will get dirt and germs of all kinds into his system.

5. DON'T fasten an array of toys to the hood of a baby's coach so that they are constantly dangling in front of his eyes whether he wishes them there or not. Try it on yourself by fastening several bright objects in such a way that they are always in your line of vision, and you will soon see how intensely irritating to both the nervous system and eyes this practise must be.

6. Don't forget to give the baby plenty of pure, fresh water to drink. He craves it; it aids his digestion and supplies his tissues with the amount of fluid which is necessary to his health.

7. DON'T give the baby his toys again after they have fallen on the street or ground, until they have been thoroughly washed, as they are bound to have been in contact with dirt of all kinds.

8. DON'T be tempted or persuaded by any one else to give the baby a "taste" of anything outside of his regular diet. The most serious digestive disturbances very often result from just this thing.

9. DON'T lift a very young baby without first carefully supporting his head with your hand. The spine and muscles of the back are too weak to support the weight of the head without assistance.

10. DON'T have a child's bed in such a position that the early morning light shines in his eyes. This may cause headache and eyestrain, and wakes him earlier than necessary.

11. DON'T make your baby ride in a low go-cart or a carriage without proper springs, or jolt him up and down the curb by letting the carriage bump carelessly. Very severe injury to a child's spine may be caused in this way, to say nothing of the discomfort of a small care in which the poor little child cannot take a nap if he feels like it.

12. DON'T leave medicines around where children can get at them, especially harmful ones. Many children have been needlessly made very ill, and many little lives actually sacrificed, by carelessness of this sort.

Getting Rid of the Ashes

The fire in the human body is not unlike that in the furnace.

You cannot get a bright, hot fire until the ashes are removed. Neither can the vital organs of the body perform their functions while poisonous, waste matter remains in the system.

It is said that the human body generates each day within itself enough poisonous matter to kill the individual ten times over. had Nature not provided means for its prompt removal.

But the blood gathers up the waste matter—the ashes—and it is the special work of the kidneys to cleanse the blood of this poisonous material.

Since the liver, kidneys and bowels are intimately connected in this filtering and cleansing process, no one of these organs can fail without impairing the action of the others. For this reason the most satisfactory corrective treatment obtainable is Dr. Chase's Kidney-Liver Pills.

By their combined action on the liver, kidneys and bowels these pills relieve and cure liver complaint, biliousness, kidney derangements, backache and constipation. By awakening the activity of these organs you remove the cause of headaches and indigestion, the blood is purified and you feel fine.

One pill a dose, 25 cents a box, all dealers, or Edmanson, Bates & Co.. Limited Toronto.

Do not be talked into accepting a substitute. Imitations disappoint.

55

Dr. A. W. Chase's Kidney-Liver Pills

WHEN YOU ARE TIRED, QUIT

We repeat—when you're tired, quit. That doesn't mean, necessarily, quit work.

It means quit spending so much time in other ways that you don't get enough sleep to furnish you with the proper working energy.

You can, of course, keep going on black coffee and your nerves.

But whenever you spend more energy than you are getting, you're issuing checks against the bank balance of future health.

And as these checks are cashed the balance dwindles.

One "night" tonight must be repair in later life—with compound interest. —Wichita, (Kans.) Beacon.

SORE THROAT

Take no chances with a sore throat. Call in a doctor—it may be diphtheria.

If your child has a sore throat be sure to call in the doctor. Only a doctor can decide whether or not the case is one of diphtheria. If the doctor says that antitoxin should be used, see that this is done; it may save the child's life. In the days before we had antitoxin, one out of three children who had diphtherit died. Now, if antitoxin is used on the first or second day of the disease, ninety-eight out of every hundred children recover. The sooner diphtheria is attended to, the more certain is a cure.

A child should not be allowed to get out of bed until the doctor permits.

Diphtheria may affect the heart if the child gets up too soon.

Do these things and you will protect your own and other people's children.

The moth ball is not as sweet as the rose, but the perfume is more lasting.

MICA HELPS THE HAUL

THE IMPERIAL OIL COMPANY Limited
BRANCHES THROUGHOUT CANADA

A WORD TO THE DAIRYMEN OF SUSSEX

(Continued from page 354)

We had the pleasure a few days ago of visiting the Scotsburn Creamery, the creamery that leads in point of output in the province of Nova Scotia.

Mr. Robert T. Stewart, the efficient manager showed us over the plant and explained the system under which the farmers of the Short Line co-operate in maintaining the van of Nova Scotia creameries. The summary of their business for the year ending December 31, 1916, is as follows:

Total cream supplied....1,027,342 lbs.
Total Butter Fat.....284,980.6 lbs.
Total Butter.....327,715 lbs.
Paid Patrons for cream.....$97,077.06
Overrun.....15 per cent.
Average monthly price for butter fat.....36 1-3 cents
Average price for the year..34¼ cents

The Annual Statements contains the following letter from Manager Stewart to the 592 patrons of the creamery:—

To Our Patrons

"You will find herewith the Annual Report of your cream accounts for 1916 showing your gross receipts from your herds, so far as you have sent cream to the factory.

"You will see the possibilities of your herds by referring to No. 224, where the gross receipts from his herd was $1178.08. If each patron supplied cream valued at one-half this amount, the returns to patrons would be $350,000, instead of $97,000. Thus you see that we have made only a start in cream production.

"In 1912, just five years ago, No. 224 was credited with $300. By cow-testing (which enabled him to select the best cows) coupled with feeding and care, the results of 1916 have been obtained. It might be difficult for each of our patrons to reach the amount reached by him last season, but we all could reach at least one-half this amount. Are we going to do it?

"We are glad and proud to be able to say that our creamery still leads the Maritime Provinces by a mile, in butter production. Our progress is a stimulus to others, and we must keep in the lead in order to maintain our reputation. We have the territory, and the MEN also, we believe, with sufficient enterprise to do it.

"We want more of our patrons to make provision for Winter Dairying, as there is more money in it, and it is the MONEY you want. Speak a kind word to your friends about the Creamery, and invite them to join you in sending their cream."

The herds supplying cream to the Scotsburn Creamery are not very large, but the average production is good. Some of them, heifers included, give an average return per head of over $100. The butter is sold to regular customers, who have been buying from Scotsburn since the creamery was first established.

Users of Scotsburn butter are unanimous in their verdict re the quality of the product, and it is summed up in the words, "Always the same".

The farmers of Scotsburn stand together for any movement that helps their industry and in community spirit.

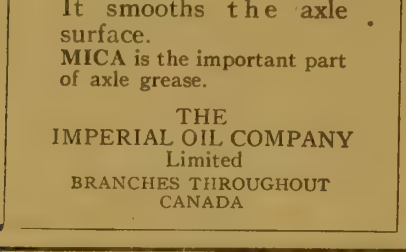
We believe it would be a good plan for the dairymen of Kings County to get together as the dairymen of Scotsburn have done. There are two good creameries at Sussex—one a private corporation, the other a farmers company. Both of these creameries could easily handle more than they do at present. The farmer who does not wish to co-operate with his fellow farmers, will find a ready market for his cream or milk, and safe and sure returns from the Maritime Dairy Co. The farmer of the co-operative class will receive like returns from the Sussex Cheese & Butter Co.

It is a well established fact that the selling of cream takes much less fertility away from the farm than does the selling of whole milk.

By patronizing the creameries the farmers will not be obliged to be on the roads at very early morning hours, nor yet at late evening hours, as is the case when milk is shipped to the city. The returns are as remunerative and always safe and sure.

The young stock will be better developed and more pork may be produced. Think it over.

SUMMER SHOES FOR MEN WHO WORK



Here is something new in footwear specially suitable for farmers, woodsmen, millmen, trackmen, laborers—all those needing strong yet light, cool, easy shoes. These are made on good-fitting right and left lasts from our famous oil-tanned Skowhegan waterproof leather with waterproofed sole leather outsoles and solid insoles.

Palmer's "Moose Head Brand"
"SUMMER PACKS" and "HARVEST SHOES"

are light weight, comfortable, durable working shoes for spring, summer and fall wear. Sold by leading dealers everywhere. If your merchant does not carry them write us, giving his name and address, and we will see that they are placed within your reach. Made 4, 6 and 9 inches high. 19

JOHN PALMER COMPANY, LIMITED
Fredericton, N. B. - - Canada

THE CRUSHING OF OATS FOR WORK HORSES IS UNPROFITABLE

The practice of crushing or grinding oats for horses is increasing. The best authorities have for years contended that grinding oats for draft horses does not pay and if the meal is made too dusty or fine it may often be injurious.

However, the practice of rolling or crushing has largely replaced grinding in many districts. Many large city companies are now using crushed grain and report favorably as to its economy. Advocates of oat crushing claim great benefits therefrom, such as:

1. Increasing the percentage of digestibility of oats for horses on hard work and having little time for feeding.

2. Greedy feeders are made to eat more slowly.

3. Horses with bad teeth are assisted to digest the grain properly.

4. That twenty-five percent of grain fed whole is not digested and is lost in the manure unless crushing is adopted.

5 Proper crushing leaves the grain free from dust and fine meal.

6 Crushing exposes the grain more fully to the digestive juices, thus aiding digestion.

7. That crushing even at a considerable cost is profitable in that grain is saved and that horses are healthier.

These and other arguments are used by advocates of crushing oats for horses. Considering the high cost of grain and also of crushing, it has been considered advisable to conduct an experiment along this line. The results of this trial given herewith appear to answer conclusively most of the above stated claims.

Results of Experiments

Five teams of horses were selected for this experiment and these were fed experimentally for eight months starting in October, 1915. The object of this trial was a comparison of the same quantity by weight of whole and crushed oats. One horse from

DUNLOP TIRES

A Great Response!

Watch "Dunlop Tires" in the emergency. There's a wealth of security in that response to the brake.

"SPECIAL" - "TRACTION"

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

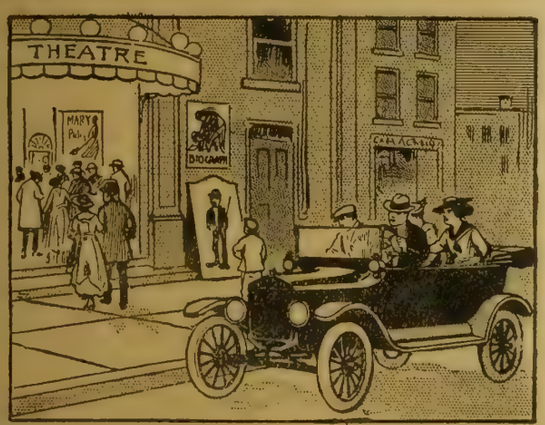
Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309 Windsor, Ontario

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:



Keeping the Boys and Girls Contented

A Ford car will give your boys and girls so much additional pleasure and enjoyment that they will be more satisfied to remain on the farm. They may then enjoy all the pleasures of city life and still live at home.

For a trip to a distant house party, a quick run to the nearest town or city theatre, or a quiet ride to church—the Ford does it all.

Buy a Ford and note the new interest you take in life. You will find your Ford always ready for a spin on either business or pleasure.

If you have a "problem" in keeping your boys and girls at home, try to solve it the Ford way, you'll find life more worth living. Work on the farm will be easier, because you have more pleasure to go with it.

each team was started on crushed, and the mate on whole oats, thus insuring a fair comparison as to work performed on each food. At the end of each month the feeds were reversed in each team. Careful records and weights were kept as to the feeds consumed. All horses received their usual supply of hay, water and salt. Horses were weighed each week.

As all experiments and practical trials have proven the value of some bran in a grain ration the following mixture: oats 5 parts, bran 1 part, was adopted for both the whole and crushed oats.

The first week of each month, the transition period, was disregarded in compiling results. The following observations were made:

1. The gains and losses in the weights of the horses were closely related to general health and vigour.

2. No horses became fat but all remained in good condition in spite of extra heavy work in fall, spring and early summer and regular work in winter.

3. During the whole trial the gains or losses in weight were approximately the same for both whole and crushed grain.

4. The slight difference in weights was in favour of crushed grain but amounted to only 125 lb. gain for 10 horses fed half the time on crushed grain during the eight months .

This is .15 lb. per horse per day. At the average charge of $2.00 per ton for crushing, such slight gains would cost 13 1-3c per pound. However no difference was apparent in health or general condition.

5. When bran was mixed with the whole oats the horses could not eat too rapidly owing to the dry, flakey character of the bran.

6. When horses were properly watered and not fed too much hay, whole grain was found in but very small quantities when at all, in the manure.

7. Both from the weights and appearance of the horses and the condition of the manure, crushing did not appreciably increase the digestibility of oats.

8. Whether fed crushed or whole grain, horses must have sufficient rest after meals to start digestion at least. If time is short, feed less rather than allow too rapid eating of the regular feed.

In conclusion, it seemed to be definitely shown that, to horses fed in the proper manner, the crushing of oats had little if any advantage and the cost of crushing is wasted.

Big Profit in Potatoes

1917 potatoes will undoubtedly command high prices. Buy a

Eureka Potato Planter

now. The Eureka line is the largest made. Three sizes, one or two rows, with or without fertilizer attachment. Used successfully for 18 years. Operated by one man, meaning less trouble and expense. Opens furrow, drops seed any distance or depth, puts on fertilizer (if desired), covers up and marks next row, all automatically. Driver sees seed drop. Does not injure seed.

Ask for catalog of Potato Cutters, Sprayers and Potato Diggers—the Eureka Line of Potato Machinery.

Do not lose sight of the fact that the horse is the strongest, fastest and most mobile unit in creation. Men have got to have him so long as men exist. No amount of mechanical horsepower will ever fill the place of a horse. It is impossible to get the same amount of strength in the same compass for the same money and for the same expense of upkeep.

MAINTAINING THE HEALTH OF THE DAIRY HERD

(Continued from page 358)

depends, in my experience, in getting the animals stomach warm. Digestion cannot begin until this is accomplished. I have seen medicine operate without carrying the load out of the stomach. Apply hot salt and renew it as often as necessary, to keep her warm, as the animal can stand. If the patient will drink, give the water as warm as possible and as she will take it.

If the animal is very much bloated and in danger of suffocating, perform the operation of tapping, or letting the gas out of the stomach. This is quite a simple operation, and is done by sticking a knife into the paunch half way between the point of the hip and the first rib, and about four inches from the bones above. A trocar and cannula is the proper instrument to preform this operation, but a knife will answer the purpose. In a bad case it may be necessary to leave something of the nature of a funnel in the opening, to allow the gas to escape. Care should be taken to disinfect the instruments used, but this stomach appears to be pretty hardy, and I have seen animals recover after some very roughly preformed sudgical operations on it.

After the medicine has operated and the cow starts again to chew her cud, and you are satisfied she is on the road to recovery, do not be too anxious to see her eat. Few inexperienced people will believe how sensitive a big cow's stomach may be at this time, and the owner is generally so relieved and pleased to see improvement in his patient, that they generally feed them too soon. I have treated enough cases to have learned by costly experience, that we must be very careful indeed for a week or two after a severe attack. It is well to let the stomach have a rest. Medical men say there are 100 overworked stomachs in men, to one overworked brain, and I think this also may apply in a certain sense to cows, and for the first day I only give warm bran drinks. A very thin mash with no hay the second day, and a very small quantity of hay and warm water for a week. Some gentain and nux vomica should be fed for a week or so to tone the stomach, and great care practised in the after feeding for some time, until you are certain the animal is fully recovered, as relapses often occur, and I have had cases that caused considerable trouble for a long period.

Stoppage of the Bowels

If the animal is not bloated and refuses food, the trouble may be a stoppage of the bowels, and exhibits symptoms of pain. From the quality and quantity of feed consumed, you may suspect the trouble to be located in the many plies or third stomach. Give a large cow a quart of raw oil with 10 tablespoonfuls turpentine and apply the warming up treatment.

My experience has been that we must act quickly to be successful, even if we do not know where the trouble may be. The treatment for any form of indigestion is practically the same. Do not wait until you fear the animal is dying before you look for medicine. Give plenty the first time. The theory of giving a small dose first, and waiting until morning to see how it may act, has killed many cattle. It is generally too late in the morning. Above all things learn to be observant and to notice every time you pass animals if they look allright. Eternal vigilance is the price of success in keeping our herds healthy.

"Astonishing how my

Strength and Fitness

came back," says Mr. Inman, a Winnipeg business man, cured by Dr. Cassell's Tablets.

"It was astonishing how my strength and fitness came back," says **Mr. G. C. INMAN, of 330, HARCOURT STREET, STURGEON CREEK, WINNIPEG,** for many years a well-known man in the business life of Canada. Mr. Inman continues: "It is about three years now since I first used Dr. Cassell's Tablets. I was terribly run-down and weak. Sometimes I felt I should have to leave off altogether, my work was such an effort to me, I ate little, I had no appetite, and I suffered if I forced myself to eat.

"My nerves of course were in a bad way, and my sleep very disturbed. Everything, in fact, pointed to a nervous breakdown. It was then a friend told me about Dr. Cassell's Tablets, and I got some to try. The first result was that I could sleep at nights, and then my health rapidly improved. It was really astonishing how my strength and fitness came back.

"I may add that some time ago my mother was very ill with pernicious anæmia. I urged her to take Dr. Cassell's Tablets, but she would not, so I crushed them down and gave them in food without her knowing. She was confined to bed before she had the Tablets, and now is about again well and bright."

Mr. G. C. Inman.

Mr. Inman is now in England, having had to return there some little time ago to take control of the well-known firm of A. W. Inman and Son, Printers and Publishers, Leeds. Letters will reach him there.

STRAWBERRY GROWING FOR PROFIT

(Cintinued from page 357)

mercial growers who raise berries for the money there is in it.

The past few years, a novelty in fruit growing has been introduced in the shape of the fall bearing strawberry. These begin producing blossoms the same year they are set out, and under good cultural conditions will continue to produce blossoms and ripen fruit, up to the time the frost kills them in the fall. The Progressive and the Supurb are two of the best fall bearers, and while not yet proved a commercial success in the Maritime Provinces, they are a great addition to the family garden. A few hundred plants will give berries two or three times a week for the table from August to the last of October. They also have a spring crop the same as any other variety, and after a short rest, will again produce in the fall. The Progressive is the earliest variety yet tested at the Central Experimental Farm and aside from its fall bearing propensities is a very promising new spring variety for the Maritime Provinces.

SPRAY CALENDAR FOR NOVA SCOTIA APPLE ORCHARDS FOR 1917.

First Spray

Time:—When leaves about blossom clusters are showing green. For Canker Worm defer this spray for a few days.

Material:—Lime sulphur 1.009 sp. gr., or 3 gals. commercial strength to 100 gals. of water (1-33), adding powdered arsenate of lime, 2 lbs. to 100 gals.

Application:—Drench thoroughly at 200 lbs. pressure, using a drive nozzle.

Pests Destroyed:—Apple Scab, Budmoth, Browntail Moth, Canker Worm, Tent Caterpillars, etc. If Aphids are present add nicotine sulphate, ¾ pint to 100 gals.

Second Spray

Time:—When blossom buds are showing pink at tips. For Canker Worm apply slightly earlier; for Green Apple Bug, leave until just before the blossoms open.

Material:—Lime sulphur 1.007 sp. gr., or about 2 1-3 gals. to 100 gals. of water (1—43), adding powdered arsenate of lime 2 lbs. to 100 gals.

Application:—Drench thoroughly at 200 lbs. pressure, using a drive nozzle.

Pests destroyed:—Apple Scab, Budmoth, Browntail Moth, Canker Worm, Fruit Worms, etc. If Green Aphis or Green Apple Bug is present, add nicotine sulphate, ¾ pint to 100 gals., making sure that every insect is covered with the spray. For very severe infestations of Green Apple Bug, the tree must be banded with tree tanglefoot before spraying and kept clean cultivated until July 7th.

Third Spray.

Time:—When blossoms fall.

Material:—Lime sulphur 1.006 sp. gr., or about 2 gals. to 100 gals. of water (1-50), adding powdered arsenate of lime 1½ lbs. to 100 gals.

Application:—Use 200 lbs. pressure and a calyx nozzle.

Pests Destroyed:—Apple Scab, Pit Rot, Codling Moth, Fruit Worms, Budmoth, etc. If Green Apple Bug is present add nicotine sulphate, 1 pint to 100 gals., using a drive nozzle as in previous sprays.

Fourth Spray

Time:—Ten days or two weeks after the third spray.

Material:—First Choice.—Bordeaux 7-7-100, adding paste lead arsenate 5 lbs. to 100 gals., or powdered arsenate of lime, 2 lbs. to 100 gals.

Second Choice.—Lime sulphur 1.005 or 1 2-3 gals. to 100 gals. of water (1-60), adding 1¼ lbs. powdered arsenate of lime to 100 gals. of water.

Application:—Use 200 lbs. pressure and a calyx no zle.

Pests Destroyed:—Apple Scab, Pit Rot, Fruit Worms, Codling Moth, Tussock Moth, Fell Webworm, Red-humped Caterpillar, Yellow-necked Caterpillar, fall feeding Browntail Moth Caterpillars, etc.

Fifth Spray

In very wet seasons a fifth spray may be necessary to control APPLE SCAB. This is applied ten days to two weeks after the fourth spray, and is the same in material and application. When Tussock Moth and Browntail Moth Caterpillars are present in injurious numbers, the application of this spray is recommended.

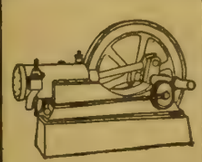
—By G. E. Sanders, Dominion Entomological Laboratory, Annapolis Royal, N. S., and W. H. Brittain, Agricultural College, Truro, N. S.

The Farm and Ranch Review of March 20th depicts on its front cover, a flock of lambs nine months old that weighed, when put on feed, 52 lbs. on November 13, 1916.—Taken off feed February 28, 1917, averaging 98 lbs.—Bred from Merino ewes with three crosses of Shropshires.—Fed on alfalfa hay and chop.—They were probably the choicest lot ever marketed in Canada and sold at the record price of $13.60 per 100 lbs

FIVE modern oil refineries, so located in five Canadian provinces as to eliminate long railroad hauls, aid directly in reducing to you the cost of the highest grade oils for the lubrication of the different machines on your farm.

All our oils are supplied in steel barrels and steel half-barrels — convenient, economical. No waste. You use every drop you pay for.

AN OIL FOR EVERY FARM MACHINE

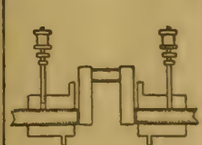


For Gasoline Engines, Tractor, Auto or Stationary
POLARINE OIL
STANDARD GAS ENGINE OIL

For Kerosene Engines, Tractor or Stationary
POLARINE OIL HEAVY
IMPERIAL KEROSENE TRACTOR OIL
(Recommended by International Harvester Co.)

For Open Bearings of Farm Machinery
PRAIRIE HARVESTER OIL
—very heavy body, resists cold, won't thin out with moisture
ELDORADO CASTOR OIL
—a thick oil for worn and loose bearings

For Steam Cylinder Lubrication, whether Tractor or Stationary Type
CAPITOL CYLINDER OIL
—the standard product for steam cylinder lubrication.



For Grease Cup Lubrication of Bearings
THRESHER HARD OIL
—a clean, solidified oil, high melting point

HOW TO DISINFECT YOUR STABLES

Farmers are constantly advised to disinfect their stables, hen houses, calf pens, etc., but do not know how to proceed to do it effectively in all cases. The following explicit direction by the U. S. Department of Agriculture will be found useful and might well be filed for future reference:

Chemical disinfectants are used to good advantage in controlling disease and the following directions for their use are given:

1. Sweep ceilings, side walls, stall partitions, floors, and other surfaces until free from cobwebs and dust.

2. Remove all accumulations of filth by scraping, and if woodwork has become decayed, porous, or absorbent, it should be removed, burned, and replaced with new material.

3. If floor is of earth, remove 4 inches from the surface, and in places where it shows staining with urine a sufficient depth should be removed to expose fresh earth. All earth removed should be replaced with earth from an uncontaminated source, or a new floor of concrete may be laid, which is very durable and easily cleaned.

4. The entire interior of the stable, especially the feeding troughs and drains, as well as milking stools and all other implements, should be saturated with a disinfectant, as cresol compound (U. S. P.), or carbolic acid, 6 ounces to every gallon of water in each case. After this has dried, the stalls, walls, and ceilings may be covered with whitewash (lime wash), to each gallon of which should be added 4 ounces of chloride of lime.

5. All refuse and materials from stable and barnyard should be removed to a place not accessible to cattle or hogs. The manure should be spread on fields and turned under. In addition, the yards should be disinfected by sprinkling liberally with a solution of copper sulphate, 5 ounces to a gallon of water.

The best method of applying the disinfectant and the lime wash is by means of a strong spray pump, such as used by orchardists.

This method is efficient in disinfection against most of the contagious and infectious diseases of animals, and should be applied immediately following any outbreak, and, as a matter of precaution, it may be used once or twice yearly.—Geo. H. Glover, Colorado Agricultural College, Fort Collins, Colorado.

HANDLING THE CHURN

My choice of churns is the barrel or plain box churn. It should be scalded, then rinsed with cold water before cream is put in. It should not be filled more than two-thirds full, so as to give plenty of room for the chug.

After a few revolutions pull the plug out and let the gas escape. Do this several times at the start or you will have trouble. Give the speed that will produce the best chug of the cream. Just before the butter gathers the sound of the churn will change from the dull thud to a watery swash.

Continue churning until the butter is in granules the size of wheat kernels, draw off hte buttermilk, rinse with clean, cold water, turn the churn a few rounds, then daw off the water and rinse again. After taking the latter out wash the churn immediately. The barrel churn is easy to clean and has no place or open space to let the cream get in, as a dash turn has.—Mrs. L. Bond.

CONTRACTED TENDONS

"Mare, 11 years old, got a wire cut about ¾ in. deep on back of left front leg about 1½ inches above coronet. I washed cut out at once with creolin and water and applied antiseptic healing powder. Cut healed up well, scarcely leaving a scar, but when nearly healed leg swelled and seemed hot up to knee. Then it broke out in two places between pastern and knee. I poulticed for this and swelling gradually went down. Since then the foot has gradually drawn back, as though cords in back of leg were shrinking, until now she can just get her toe on the ground. If she puts weight on it the pastern joint almost touches the ground in front."—J. D. M.

This horse is now suffering from contracted tendons and a severe inflammation of the tendons, sheaths, and joint. The conditions is now too severe to expect a permanent cure. Would recommend blistering around the pastern with any good blistering absorbent preparation, such as absorbine, or caustic balsam. A special shoe should be put on the foot of the affected leg to afford mechanical relief. Such a shoe should be high at the heel, and have an extension projecting heel.

CORRECTING SPRUNG KNEES

A Belgian colt stands over a little in his knees. Will he outgrow it or would it be best to shoe him? What would be the best method of shoeing? He is 9 months old and weighs 1,060 pounds.—R. L. B.

Standing forward in the knees may be an inherited weakness. Many heavy-boned colts are subject to it, especially in their first period of rapid growth, when carrying plenty of flesh with not enough exercise. This colt is heavy for his age. Do not feed to put on flesh. Seek growth. Give a sufficient quantity of grain, mostly oats and bran. Be sure that the colt can run out and have plenty of exercise. When in the barn provide him with a boxstall. It is injurious to tie colts up in stalls as they usually become low in front. It is advisable to have this colt shod. In paring the hoof save the heel and lower the toes. Have the shoes made thin in front and running thicker towards the heel. The colt will gradually improve and out-grow the fault. If inherited, the recovery may be slow.—Emery H. Joye, in Breeder's Gazette.

McLAUGHLIN

RESERVE POWER

THE McLaughlin valve-in-head motor actually develops from 15% to 20% more power with the same fuel consumption than any other type of motor of the same bore and stroke. This fact has been established by engineers, by block tests and tests in actual service. This means fuel economy and power.

Because this power is sometimes vital, it is found in abundance in McLaughlin Motor Cars, ready for instant application. It is "RESERVE POWER" and marks the dependable and efficient car.

Send for Catalogue "B," describing our complete line, to

THE SMITH FOUNDRY CO., Ltd., Fredericton, N. B.

3½ BBLS. POTATOES FROM 15 OUNCES OF SEED

In the year 1896, just about 21 years ago, I sent for 1 lb. of Maule's Early Thoroughbred seed potatoes, for which I paid $1.50 and when received by mail from Philadelphia, they weighed without wrapping barely 15 ounces. I cut the sets very small, even splitting the eyes, and at the seed end where the eyes are very close together, the sets were as small as beans, or even as small as peas.

The land had been manured and plowed the autumn before and very thoroughly cultivated in the spring. I made the hills 3 feet apart. In all, I think I had 177 hills, each of which I dug out about 8 inches to receive the set, which I covered with only about ½ inch of soil at first, but I filled it in very gradually as they grew, until it was level with surface of the hill.

About the first of June we had a very heavy thunder-shower, and the land which sloped to the southwest completely filled the hills with earth; but I dug the hills out very carefully again, I think with my fingers, so as not to hurt the tiny leaves, and this soon revived them. I kept on gradually filling in the hills as they grew, until they were level with the surface. Then I cultivated them all through the summer once a week, and oftener if there was even a shower to pack the soil. I cultivated as soon after as it was dry enough not to pack the earth. The second time I cultivated as deep as I could, but after that I cultivated as shallow as I could. Some years even before that, I gave up hilling potatoes, as it cuts off so many little rootlets. When we dug those potatoes in the autumn the ground was literally covered and we had 3½ bbls. from 15 oz. of seed. We still have some of that same good yielding variety, only being pink they are not so good for market, but they are early, good keepers and about same quality as the old Early Rose.

A few years before that time I bought 1 lb. of Freeman potatoes, a variety much like the old Snowflake only a much better keeper for spring use. I gave the 1 lb. of seed good field culture and I had 2 bushels in the autumn, which I planted the following year and the sets yielded 40 barrels. We are still platning the same variety for market, after 23 years, and find it yielding and keeping well.

JOHN H. KING,
Kingsbrook Farm, Sussex.
April 19, 1917.

Editor's Note:—Can any of our readers give records of production that will approach or surpass those furnished by Mr. King.

STOCK NOTES

Mr. Hugh R. McMonagle, Sussex Corner, has recently returned from Ontario, where he purchased two pure bred Clydesdale stallions. Mr. McMonagle has been instrumental in introducing new blood from time to time into the horse breeding industry of his native and adjoining counties. He intends to retain one of the stallions for stud purposes, the other he will sell. The stallions are:

Stanley Prince 2nd, 4325.

Dam

Queen of Quality, 2519.
Fanny, 2518.
Kate, 2533
Jean.

Sire

Stanley Prince (2265) 6315.
Prince of Quality Imp. (2173) 10416.
Self Esteen Imp. (377) 5344.
Alexander McGregor, 111.
Dainty Davie, 152.
Clydesdale Jock, 195.
Cumberland (Imp.) (172) 106.

Stanley Prince 2nd is a low set horse of great substance, weighing 1845 pounds. He is a guaranteed, sure stock getter and has been a first prize winner on fifteen different occasions in Quebec and Ontario. He has also won several diplomas and three gold medals, the latter including the Hon. R. L. Borden gold medal at Ottawa in 1915 in a competition of 15 horses, where he was also first with three of his get.

The other horse is Dunure City 2nd, 13111, sire Dunure Wallace Imp. (8455), 14488. Dam Lady Radal, 16563.

Dunure City is also a guaranteed stock getter and a grandson of Baron of Buchlyvie, the $47,000 Scottish champion.

What about an adequate supply of green feed foil soiling purposes during the season, when pasturage will be short this summer.

THE FACTORS WHICH CONTROL THE DEPTH OF PLANTING OF GRAIN

When a seed germinates, it sends out a sprout and some temporary roots. The sprout must push its way through the soil. The food stored in the seed is used to keep the young plant growing until it has time to send out roots from the sprout. This requires about a week. The roots that first appear die at this time. Therefore a small seed planted deep in a heavy soil may never come up, although it may start growth. The same seed planted the same depth in a sandy soil might easily grow.

Corn has larger seed than wheat. There is more substance in the grain and it can be planted deeper in the soil than wheat. The depth is not in proportion to the size of the seed, because the corn sprout is larger around than the wheat. Therefore for each inch of growth, more food is required.

The location of moisture is important. A seed planted in dry soil is not going to grow until it rains or until the soil becomes wet, and since a loose soil dries out quicker than a compact soil the seed must necessarily be planted deeper in the loose soil in order to get to moisture. For this reason the seed bed for wheat should be more compact than the seed bed for corn. The corn sprout will grow higher than the sprout of wheat because there is more plant food in the kernel.

Grain crops should be planted sufficiently deep to get the seed into moist ground and at the same time is should be planted shallow enough so the sprout can reach the surface. This depth varies according to the kind of seed, type of soil, and location of moisture.—O. S. Rayner.

BIRD NEPONSET PRODUCTS

Look for the Roll With the Paroid Label

The Supreme Roof Covering None Genuine Without it.

NEPONSET
Paroid ROOFING

PAROID claims your consideration as the supreme roof covering, because it is approved by the National Board of Fire Underwriters, and is used by Railways and in Government Military Camp Buildings.

Farmers, who 19 years ago laid Paroid roofs on their barns, have had absolute security ever since—and their roofs are still good. Proof against the weather, the greatest protection against fire, these roofs have given

19 Years' Roofing Satisfaction

The name Paroid has come to mean something more than ready roofing. Demand Paroid and look for the name on every roll you buy, because inferior grades have often been offered as being "the same thing as Paroid." This is a warning, for your protection as well as ours!

Paroid is positively fire resisting; burning brands die out without damage on it. Paroid costs no more than the best wooden shingles. It is easiest to lay, lasts longer, and gives you the greatest protection all the time. You waste no time repairing Paroid roofs.

Neponset Paroid is made in three permanent colors, Grey, Red and Green, the last two being surfaced with crushed slate

For your home select Neponset Twin Shingles, Red or Green, with the same high qualities of Paroid.

Lumber or Hardware dealers sell Neponset Products and will give you good satisfaction.

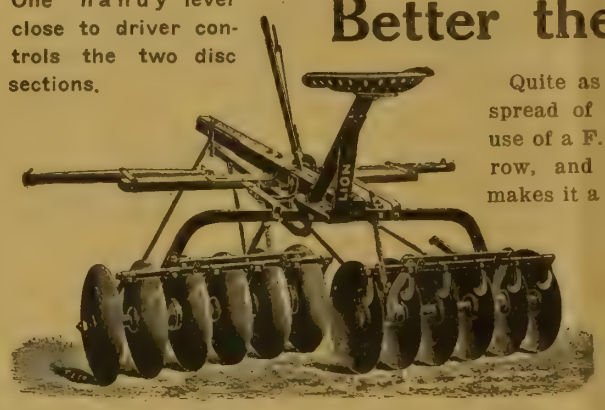
The Finer the Mulch---the Better the Crop

One handy lever close to driver controls the two disc sections.



Quite as important as a spread of fertilizer is the use of a F. & W. Disc Harrow, and its light draft makes it a pleasure to use.

The value of a good seed bed cannot be over-stated. Take no chances THIS year.

Frost & Wood "Lion" Disc Harrow

A staunch in-throw Harrow; the two disc sections, held in place by an immensely strong main frame of steel, are run on highly polished, dust proof ball bearings, and the angle of their "cut" is controlled by one handy lever. The inside discs are kept into the soil by strong springs and driver's seat is well back so as to lessen neckweight on horses, meaning extra light draft. Two sizes, 12 and 14 discs.

SEE YOUR NEAREST FROST & WOOD DEALER

He'll gladly show you these splendid Harrows and other implements in the old reliable "F. & W." line.

Work It Hard as You Please

Its light draft and staunch build enable you to tackle the roughest field.

Frost & Wood Champion Disc Harrow

Forecarriage makes work and turning easy

Two easily-operated levers, handy to driver, control the disc sections, so you can vary the "cut" of the discs very quickly to suit the ground. The disc sections run on splendid, ball bearings; and light draft is further helped by the discs being kept always clean and bright by scrapers, thrown in and out of use by convenient levers. Immense strength, and high quality materials, ensure few repairs and year-in-year-out readiness for work.

F. & W. guarantees and reputation are your ample safeguards.

WITH LOUDEN EQUIPMENT IT IS EASY

Your time during haying and harvest is most valuable. Save one-third of it by using Louden Hay Tools. They enable you to move larger loads easier and faster than in any other way. There are no delays at the barn for the user of Louden equipment. Louden Carriers with forks or slings will handle the loads safely and surely, and just as fast as they can be drawn from the fields.

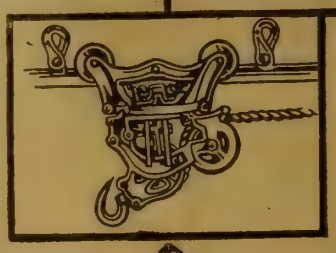
THE LOUDEN JUNIOR CARRIER

Is at all times safe and dependable, because of its simplicity and its strength. For twenty years it has been standard, and on thousands of farms it is to-day giving excellent service.

THE LOUDEN BALANCE GRAPPLE FORK

Set the tines of the fork deep into the load. It will lift an immense bundle and deliver it in the mow in even flakes, not tangled up as is the case when other forks are used. Handles clover, alfalfa, loose grain or straw, as clean as timothy.

Our catalogues will tell you all about the big Louden line. Write for them to-day. They are free.



LOUDEN BALANCE GRAPPLE FORK

LIFTS HALF A TON

UNEQUALLED IN CLOVER OR ALFALFA

FILL OUT AND MAIL TO-DAY

Without cost to me, send books or information on lines checked below:

( ) Hay tools.

THE MARITIME FARMER

AND

CO-OPERATIVE DAIRYMAN

REGISTERED TRADE MARK

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 22. SUSSEX, NEW BRUNSWICK, APRIL 24, 1917. Number 14.

Buying and Selling Co-Operatively

Are You Interested? Read! Think! Act!

Co-operation has been, for many years, a mooted question among the farmers of the various agricultural sections of Canada.

Various organizations, based on this laudable principle, have been established, with a view to effecting a closer relationship between the farmers themselves and the cutting down of the expense of getting goods and produce from the producer to the consumer.

The toll, taken by middlemen, who do comparatively little, if anything, to keep the wheels of progress in action, is simply appalling. Many of them are of no more value to a community than a fifth wheel would be to a carriage. They eke out a fat living in their parasitic existence on the labours of the producers.

The toll taken by the middlemen, includes the greater percentage of what the consumer has to pay for produce and goods, as will be readily ascertained by any person who will take the trouble to compare the prices charged by the producer with the prices which the ultimate consumer has to pay.

In sections where no co-operative organization exists for the direct handling of the staple commodities, it is true the middlemen have their place, and so long as the farmers and consumers are content to allow so much toll to be taken off them, so long will they have to pay exhorbitant prices for goods purchased, and take the lowest possible figures for the products which they have for sale. And just so long will the farmers be obliged to secure a lesser return for their labors than they would be entitled to if they would realize and take advantage of the power they themselves possess in the weapon of co-operation.

Co-operation has had its ups and downs. Whether you have been successful with a co-operative movement in your section or not, depends entirely on the energy and zeal you and your associates have put in the work. One of the big causes of failure to make co-operation go with a swing in certain districts, has been due to selfishness getting the upper hand. In other sections, Dr. Reynold's adage, "He who waits to do a great deal of good at once, will never do any", has been neglected, while in other cases trying to do too much at the start, has sounded the death knell of young organizations. It is always wise in establishing a co-operative movement to "creep before you walk." Get one or two lines firmly established, and then take on more work as your machinery is able to handle it effectively.

The middlemen understand each other very well, and just as soon as a co-operative organization is launched, they like Demetrius and his associates of old, get together and their spokesman announces:—"Sirs, ye know that by this craft we have our wealth. Our craft is in danger of being set at naught", and all with one accord cry out, saying: "Great is Diana of the Ephesians."

Immediately ways and means are planned for the smothering of the young organization. If the various members of the co-operative organization are not wary enough to watch the snake-in-the-grass and forestall its methods of spreading discord, and putting obstacles in the way, unretrievable damage may be done and the organization may receive such a set-back, that it may take years to overcome, or disorganization may eventually take place.

The biggest co-operative organization in Canada today is the Grain Grower's Association of the West. Then there are the Fruit Shipping organizations of British Columbia, and The United Farmers of Ontario.

Coming nearer home, we have the United Fruit Companies of Nova Scotia, the Egg Circles and Co-operative Lamb Sales of Prince Edward Island; the various Wool Grower's Organizations; The Agricultural Societies united of New Brunswick, The Pictou County United Farmers and several kindred organizations in the three provinces.

The Egg Circles of Prince Edward Island have been the means of putting a better grade of eggs on the market, and the returns to the individual poultry men have been much larger than would be possible under the old system of individual marketing.

The history of the Lamb Sales organization, which conducts its operations in Prince Edward Island, and which has been the means, under the efficient direction of Rev. Dr. P. C. Gauthier, of netting the farmers the highest market prices for their lambs, is well known to the readers of the Maritime Farmer. It is no longer a question with the Prince Edward sheepman as to who dictates the price. "We will take so much for our entire lamb crop", is the way they talk. The old way was the buyer saying, "I will give you so much."

The various wool sales organizations have done good work during the short time they have been in operation. Through their agency the wool growers have been able to receive top notch prices for their wool, and thus thousands of dollars have been brought to the farmers' pockets, that otherwise would go to middlemen.

The United Fruit Companies of Nova Scotia have proved the merits of co-operative buying and selling to a marked degree. In seasons of glutted markets, full crops, and deficient transportation facilities, they have solved the most difficult problems and have been the means of getting good average returns for their patrons, where some of the fruit men, who would not co-operate, but who were willing to support a horde of middlemen, had to put up with slim returns or let their fruit rot in their orchards and warehouses. Co-operators do not have to give their apples away and pay for their delivery to the English market as individual shippers have occasionally been called upon to do in the past.

In the purchasing of suplies they have saved their patrons thousands of dollars each year, and the good work still goes on. Vested interests have repeatedly striven to sow discord among the members, but the more intelligent and business like growers refuse to be foozled.

The New Brunswick Agricultural Societies United, have saved fertilizer users of the province hundreds of thousands of dollars in the purchase of chemicals for fertilizing purposes. We have known cases where from $5.00 to $15.00 was saved on the purchase price of a single ton. Is it not worth while getting in line?

The farmers of Pictou County are vigorously pushing the work of co-operative purchasing and sales organizations, and the outcome is bound to favorably affect the farming industry of the county.

It is unnecessary for the Maritime Farmer to go any further into the merits of co-operative organizations. Our intelligent readers know what co-operation has done for others in the past, what it is doing for them, and what it will do for all those, who, endowed with the right spirit, will enter the ranks.

The dairymen of the Maritime Provinces annually import thousands of tons of mill feeds for their stock. The major portion of this feed is purchased in small lots from middlemen, who in turn purchase in small lots from the mills in the case of some lines, and through brokers in other lines.

One of Canada's best authorities on live stock, told us not long ago, that he and some other progressive farmers had purchased their bran requirements, in the summer of 1916 for $19.00 per ton F. O. B. mill.

While in Truro a week or two ago, one of the prominent dairymen of that vicinity, told us he had purchased one ton bran and one ton middlings that day for cash, and had to pay $44.00 per ton for the former and $47.00 per ton for the latter.

Some difference between $19.00 per ton and $44.00 per ton! The dairyman in question could have purchased his bran requirements last summer, when prices were at their lowest.

Our dairymen are paying too much money for the mill feeds they use. We would, of course, advocate the home growing of feed as much as possible, but so long as feeds are imported, why not have it done in the way that will bring it in the cheapest possible way.

The solution of the whole matter is to be found in co-operative buying.

Why not have the purchase of feeds conducted along the same lines as the purchase of fertilizers is now conducted by the New Brunswick Agricultural Societies United?

The plan would be somewhat as follows:—

Take cotton seed meal purchasing as an example. Any farmers' club, whose cotton seed meal requirements would aggregate one or more car loads in one year, would be in position to buy at the lowest market price, by making financial arrangements with their nearest bank. This would be done by the Directors of the club signing a joint note, which would be deposited by the Secretary-Treasurer with the Bank. The Bank manager could then guarantee the payment of sight-drafts attached to carload bills of lading. The cotton seed meal would be distributed ex-car, for which the patrons would be required to pay cash or bankable paper satisfactory to the directors of the club, at the time the goods were delivered. The meal would come freight prepaid, the amount of freight included in the draft.

The Secretary-Treasurer of the club would be required to furnish each member with a blank requisition form, on which the members would state the quantity of cotton seed meal required for one year by each individual member. These forms would have to be returned to the Secretary before a set date. The Secretary would file these signed requisitions, total up the requirements and forward the aggregate order, together with the Banks guarantee to some central organization that would aggregate the orders from the various clubs in all parts of the Maritime Provinces that would wish to so co-operate. This large order could be sent direct to the mill instead of to the broken, and the purchase thus made at the very lowest possible figure. Each club would set the percentage over cost price to pay for the secretary's work, in looking after the business of securing orders, distribution and banking.

The Maritime Farmer will gladly act as the central buying organiza-

(Continued on page 410)

The Farmer's Bit Behind The Front

Everywhere, the world's reserve supply of food-stuffs is being rapidly reduced. Recent advice indicate that the wheat production of Argentina, New Zealand and Australia is estimated at only 70 per cent. of last year's production. The factors tending towards reduced production, such as labour shortage and increased cost of seed, will adversely affect every department of the farm. This means that supply will not overtake demand for some time to come.

It will be both patriotic and profitable for farmers to put forth the utmost effort to increase the food supply. Unlimited food is a vital necessity to the successful prosecution of the war, and its production is true national service, irrespective of the reward that may be looked for in dollars and cents.

The call has gone forth for increased production of food supplies for 1917. The man on the farm has a service to perform just as surely as has the man in the trenches. Food is one of the essential munitions of war. Our boys in the trenches serve long, weary hours without the comforts of home to go to when their watch is over. Our boys at home ought not be too fastidious about the hours they work at home. Their lot is an easier one than is that of their fellows who are afar fighting the battle of freedom for them. They have their comfortable beds to go to when the days work is done, where there is no one to molest them or make them afraid.

So urgent is the call for increased production that Sir Arthur Lee, the Comptroller of Food Supplies for England, is asking the farmers to work seven days per week during the seeding season.

In the Maritime Provinces our farmers are short of man power, and when increased production is urged the farmer will naturally wish to know how he can accomplish the task. Brain must be used instead of brawn. Only in rare occasions will it be found practicable to increase the acreage so that the question finally resolves itself to one of improved methods.

All the horsepower a farmer can muster and handle must be put in the field. Three and four horse teams must be used on heavier and more efficient machinery. Thorough preparation, fertilization and cultivation must be practiced, any one of which will increase the yield over that of where only slipshod methods are employed.

The very best seed available must be used.

Many farmers could increase the yield and profitableness of their field crops by sowing the particular varieties best suited to their soil and climate. More bushels per acre of barley, oats and wheat can be obtained by this means without a corresponding increase in labour.

That large, plump seed will produce more bushels per acre than will the average seed used by many, is an established scientific fact.

Fifteen per cent. is a rational increase that can be had from every acre sowed if the necessary precautions are taken.

Throughout the Maritime Provinces the approximate increase becomes an enormous amount.

This amount can be secured without the expenditure of any extra labor at seeding time, and with but little at harvest time.

Careful preparation of the seed is the secret.

All necessary seed should be properly cleaned and bagged during the late winter season. Every farmer has time to do this after March first and before seeding time. Will you assist in the Greater Production of foodstuffs by careful cleaning of the seed?

Perhaps pedigreed seed cannot be secured. If not, select out of your granary three times the amount of grain required for seed purposes. By use of the fanning mill, clean and reclean until you have just sufficient for seed purposes.

Use proper sieves and plenty of wind in the mill and the third part remaining for seed will be the largest and plumpest seeds, which naturally are the most vigorous.

Do this work before seeding commences.

Do not hesitate to purchase pedigreed seed at an advanced price.

Two bushels of oats will sow an acre. The extra return from good seed will be from 5 to 10 bushels per acre, and decidedly more in some cases.

The market value of the increased yield represents the additional outlay that can be made for good seed per acre.

Vigor in seed grain is just as essential as vigor in live stock.

In a recent address, the Dominion Minister of Agriculture, Honourable Martin Burrell, stated that last year's epidemic of rust in the prairie provinces had cost this country one million dollars. That represents $143.00 for every farmer in Canada. Other diseases and drought occasioned the country a loss of another fifty million dollars. No specific remedy for rust has yet been discovered. This much is known, that a late maturing crop is more subject to the disease than one that ripens early. It therefore follows that while no variety of grain is immune, the early maturing varieties will have the best chance of escaping. A reasonably early spring, early sowing and a quick maturing variety of grain constitutes the best insurance against such an outbreak as was experienced last year.

Among other diseases which cause havoc among growing grains, Smut is perhaps the most widespread. It is stated that the annual loss due to Smut in Oats, Wheat and Barley amounts, in an ordinary year, to seventeen million dollars, or 6.2 per cent. of the capital invested in those crops. Prevention of this kind is most necessary in these days of high cost of labour and seed. Wherever there is a danger of Smut attacking either of these crops, farmers will do well to take this simple precaution.

Prevention of Waste

This waste can be largely eliminated by proper treatment of the seed.

Secure 1 pint of formalin for every 20 to 30 bushels of oats required for seed purposes. Dilute with 42 gals. of water, and use a barrel in which the bags of grain may be immersed for 20 minutes. Spread out to dry, and then place in new bags or in bags that have been treated in a similar manner and thoroughly dried, thus preventing re-contamination.

The adoption of these two suggestions would mean millions of bushels of grain extra.

A few precautions should always be observed.

(1) Formaldehyde varies in strength and, if there is doubt as to its quality, a sample of it should be sent to the chemise of the Experimental Farm, in order to determine its exact strength.

(2) The sacks in which the grain is treated should first be cleansed by boiling in water, or by washing in a strong solution of formaldehyde.

(3) Everything which the grain touches after having been treated, sacks, seeder, etc., should be very thoroughly cleaned with a strong solution of formaldhyde (1 pint to 10 gallons of water.)

(4) If the seed is kept for some time after treatment; allow for the swelling of the seed, if you sow the grain soon after treatment, by planting per acre.

The common Scab of the potato is unsightly and while it does not cause the damage that is attributed to the Powdery Scab it depreciates the selling value of your potatoes. No one wishes to buy scabby potatoes. If you do not grow scabby potatoes you will have no scabby potatoes for sale. The scab of potatoes is a fungus growth which shows itself in a rough and cankerous appearance on the surface of the tubers. A great amount of work has been expended on this disease and still no preventive is known if the land is inoculated with the trouble.

Of a large number of methods used for treating the seed potatoes, soaking them in a solution of formalin, one pound to thirty gallons of water for two hours, is the most effective. Soak the potatoes before cutting them, and if they are not planted at once spread thinly to dry. This treatment will kill the disease on the seed, but scab can live in the soil for many years without a known host. Lime, wood ashes and barnyard manure aid the growth of scab, while sulphat of ammonia, muriate of potash, acid phosphate and dissolved lime render the soil less favorable to the disease. If you have never treated your seed potatoes for scab do so this year and watch results. You will be delighted with the smoothness of the tubers. If you have used the treatment once we know you will do so again.

Professor C. A. Zavitz in correspondence with an exchange, says that:

"Skilled labor throughout the province is very scarce. The farmers of Canada have an exceedingly difficult task ahead of them if they are to increase the production of the most valuable kinds of food materials in 1917. The following suggestions are offered in the hope that they may prove helpful:

"1. Carefully plan the crop production for the season at an early date.

"2. Thoroughly clean and grade the grain so as to procure the large, plump, sound and well matured seed.

"3. Test the germinating power and the vigor of the seed before time to sow.

"4. Overhaul implements and machines so as to be ready to start seeding early and to sow each class of crop at the best time for highest results.

"5. Arrange for at least a small amount of such cultivated crops as beans, potatoes, turnips and corn.

"6. Watch and destroy the weeds before they are able to make much headway.

"7. Economize man labor by using three and four horse teams when possible.

"8. Plan so as to make the best use of the unskilled labor which is available."

The Cost of Growing Potatoes

In potato growing provinces like New Brunswick there is always more or less discussion as to what it should cost to grow a good crop of potatoes and statements vary from as low as $40.00 per acre to as high as $125.00. Naturally there will be much variation in cost according to local conditions and especially to the ability of the land to produce without expensive fertilizing. It should be borne in mind that it will usually cost the potato specialist more to grow his crop than it will the farmer who follows mixed farming and makes his potato crop merely one of his many activities.

With a view to getting actual figures under average conditions in New Brunswick, a careful record has been made at the Dominion Experimental Station, Fredericton. for the past two seasons with an acre of land set apart for this particular purpose.

Neither rent of land nor depreciation of machinery was included in the calculation, for these two are items that are largely in the hands of the individual grower. As a general rule, however, it would be fair to charge as rent, 10% of the value of the land, and special potato machinery will depreciate from 25% to 50% per year if used steadily for ten days each season. In 1915, the depreciation of the potato digger alone, used at the Experimental Station, was $6.00 per acre.

In 1915, the acre was planted with Green Mountain, Irish Cobbler and Empire State. Seed, cultural operations and harvesting cost in all $67.93. Eighty barrels of 165 pounds each of marketable potatoes were obtained and sold at $1.75 per barrel, making a profit over cost of production of 90c per barrel. Seven barrels of culls were sold for $3.50, so that the total profit for the acre amounted to $75.50.

This land was rather wet naturally and during the very raing weather of June and July, was several times flooded, causing missed hills and inferior plants generally. This land was originally cleared many years ago, and after cutting hay for thirty years it was allowed to grow up to spruce, birch and alder. It was again cleared in 1913 and grew buckwheat in 1914.

In 1916, an acre was planted with Green Mountain seed.

The total cost amounted to $82.33, the increase over 1915 being due to high priced seed, higher priced fertilizer ingredients and very dear copper sulphate.

One hundred and twenty barrels of marketable potatoes were harvested and could have been sold at $2.25 per barrel, making a profit per barrel over cost of production of $1.56½, plus six barrels of culls at 50c, $3.00, making a total profit of $190.20.

Market price when potatoes were dug was $2.25 per barrel. Later they could have been sold at $3.25, but are held for seed.

This land grew hay for many years and was broken up and grew potatoes with 750 pounds fertilizer in 1913, corn with 18 tons barnyard manure in 1914, oats without manure in 1915. This land is on a slope, fairly well drained and except for washing out slightly between the rows felt no bad effects from the June deluge.

"One year of seed, 7 years of weeds." Weed seeds are produced in great abundance. A given crop of weed seed does not germinate the first season, but distributes its germination over a period of years.

Seeds deep in the soil do not germinate readily because of lack of oxygen, and those that do grow exhaust the stored food in the seed before reaching the surface. Seeds may lie buried in the soil for years without losing their power of germinating. Such seeds may germinate readily when brought to the surface.

The Place of Roots in Our Farm-Scheme

Editor The Maritime Farmer:

The agriculture of any locality must be adapted to its climate. Each crop has its own climatic requirements which the farmer should study carefully, for the art of crop production is the securing of perfect harmony between the plant and its environment. Upon the climatic and soil conditions and the cropping systems, depends the extent of the live-stock industry of a locality.

The growing of crops is purely agricultural and is limited to the summer months, whereas the live-stock industry is a combined agricultural and manufacturing industry which gives employment to the country population throughout the year. Particularly is this true of the dairying industry.

With our cool temperature and the character of the precipitation, pasturage in New Brunswick is unsurpassed and the production of such forage crops as clover and roots is highly profitable for the continuance of the production of dairy products during the winter, or, in the case of turnips, as an immediate money crop.

Whether the growing of roots or corn as food for live-stock is to receive the greater attention, is largely a matter of their productivity in our climate and their suitability as succulent food. Root growing is general over the whole province, while the production of corn is more localized. To winter stock cheaply an increase in the production of one or other of these crops by almost every stock-owner is necessary and the climatic and soil conditions for growing the best possible root crops are unsurpassed.

There are in this province about 200,000 head of horned cattle and the present production of roots is such that it would allow only 20 bushels to each animal,—just about enough for two month's feeding.

Were we to take a leaf from the Book of Agircultural Practice of Denmark, in the matter of root-growing for stock-feeding, our agriculture would profit immensely. Denmark is but half the size of the Province of New Brunswick, yet the

		Yield per acre	
		Swedes.	Mangels.
Root acreage in Denmark in 1897 was	200,000 acres.	14.3 tons	17.0 tons
" " " " " 1912 "	624,000 "	17.0 "	21.0 "
Increase in 15 yrs.	424,000 "	2.7 "	4.0 "

This is an immense increase and the people all speak highly of the practice as a part of their general agriculture for the sake of the fields and the sake of the live-stock.

We in New Brunswick produce about 8,000 acres of roots. Is it because we will not bend our back to hand-hoe that we do not grow more, or is it because we fail to realize their value? Surely when turnips sell at 75c and $1.00 per barrel, the acre-profit would equal or surpass that of potato growing, if we knew how to grow them at the rate of 1000 bushels per acre, and such yields can be secured with less work than will produce 100 barrels of potatoes.

If it is true of us, as an English authority on roots states was told him of Americans, that no American would bend his back to hand-hoe, then we must devise some other practice to take its place, for it is but too true that the production of roots and root seed is limited rather by the labor supply than by any other cause and the necessity of new methods of culture in the farm-management scheme is apparent. Fall preparation of the soil, early sowing, early thinning and the introduction of horse labor wherever possible, are the chief ways of effecting changes which will tend to increase both the acreage and acre-yield.

The varieties of roots grown as food for live-stock in this province are:—Swede turnips, mangels, carrots and soft turnips. No one variety should be grown to the exclusion of all the others, a better plan is to grow the greater acreage of that variety which is best suited to your immediate locality, to your particular needs and the class of stock receiving them. Thus a portion of the root land would be sown to soft turnips for early fall feeding if one were engaged in dairying, while if hogs were also kept, a portion of the root land should be sown to mangels, even though the locality were especially favorable to Swede turnips.

The root crop should follow a hay crop or clover sod plowed four or five inches deep as soon as possible after haying rolled and harrowed for the purpose of rotting the sod. Later in the season manure should be spread, say, about twenty-five loads per acre, and the ground again plowed, this time deeper than before.

If manure is not available at any time during the fall, then the ground should wait until spring before replowing, when the manure should be applied and plowed under.

Roots are gross feeders, so to speak, converting a large amount of manure into vegetable produce.

Mangels in particular respond to generous applications of barn-yard manure and to mineral nitrogenous manures.

The following table of results, taken from a thirteen years' experiment at Askov. Experiment Station, Denmark, will show the response of mangels compared with potatoes, to commercial fertilizers or manures.

	Commercial Fertilizers. Yield.	Manure. Yield.
Mangels.		
Clay Soil	100%	91%
Sandy Soil	100%	78%
Potatoes.		
Clay Soil	100%	99%
Sandy Soil	100%	88%

Heavy applications of nitrate fertilizer greatly increase the amount of leaf or tops of both mangels and turnips, but where the amount of nitrate is in excess of the phosphate and potash salts, the quality of the root is injured.

The mangel requires a specially favored soil,—deep, friable and fertile to yield its maximum growth. On weak land, even though heavily manured and with commercial fertilizers in addition, it does not yield heavily. It is thus adapted to favored localities where a good system of farming and cultivation is observed. Under such conditions it is not dependent upon summer moisture conditions, i. e., drought; but mangels will not thrive during cold or wet summers.

Turnips do comparatively better on the poorer and less cultivated soil, giving good yields during cool or wet seasons; these in turn suffer from heat or drought during summer and make greatest growth during late fall.

Carrots require intensive culture. The seeds are smaller and are slow to germinate, and the seedlings are small and weak until after mid-summer and make the largest part of their growth following late summer.

Sowing in drills should be the exception, not the rule, though on flat land or where drainage conditions are not good, or where weeds are very persistent, cultivation can be given earlier when in drills.

Flat culture is cheaper, as the spike-tooth harrow may be used for thinning, and usually a better stand of roots is secured. Moisture is also better conserved.

Long varieties of roots should be planted on deep soils or where drilling is practised. Short varieties are suitable to shallow or poorly drained land.

Early sowing has two points in its favor worth keeping in mind:—(1) Should germination of the seed be poor or should the stand be destroyed by insects,—reseeding can be relied upon to give a partial crop.

(2) It gives greater yields than later sowing.

Results of experiment in seeding dates.

Swedes sown	May 8th,	Yields	35.9 tons
" "	June 8th,	"	24.4 "
Mangels "	May 8th,	"	35.4 "
" "	June 8th,	"	16.5 "
Carrots "	May 8th,	"	28.7 "
" "	June 8th,	"	18.8 "

Thick seeding insures a good stand. The amount of seed recommended to sow, is therefore greater than is usually considered sufficient, viz.:

Mangels, 12—16 lbs.
Turnips, 3—4 lbs.
Carrots, 2—3 lbs.

The germination of carrot seed can be hastened considerably by placing it in a moist dish for several days before sowing.

Where flat culture prevails, harrow the plots crossways about two weeks after planting, and again four or five days later. A wheel hoe should be used as soon as plants appear well established.

Carrots do not require thinning with a hoe, but a heavy garden rake can be used to advantage.

Singling of turnips and mangels should be done early at distances, viz.,

Mangels, 8"—10".
Turnips, 10"—12"—14".

The after cultivation should be such as to keep a mulch, even if the land has been at first well worked and weeded.

Harvesting of mangels should be done before wintry weather begins, but light frosts do not harm them.

The tops should be wrung off and left on the ground. If four rows of roots be thrown together, loading is easily done.

The percentage of dry matter in the tops of mangels is much less than that in the root and they are of less value than either turnip or carrot tops.

Several methods are used for harvesting turnips and carrots besides hand-pulling.

The tops of turnips are sometimes cut off with a short-handled hoe, gathered and loaded into a wagon, then the roots are plowed out, and a spring-tooth harrow turned upside down, is drawn over them once or several times to clean them, or they may be lifted with the potato digger,—(Hoover type), and then drawn to the cellar.

Carrots may be quickly harvested by running a plow close to the row, throwing the furrow away from the row, and then pulled, throwing the roots directly into the cart. Topping is done when unloading at the barn.

Carrot tops have the same feeding value, pound for pound, dry matter, as the roots, while fifteen pounds of turnip tops are equal to ten pounds of the root.

Carrots make an excellent dietary food for horses and have a special value for warding off colic, and when fed during attacks of distemper or other throat diseases.

Swedes are excellent for horses also, up to eight or ten pounds daily.

Mangels do not in any way cause bad flavors in milk, and are eaten by cows when refusing nearly everything else, hence they are one of the best articles of diet that can be fed to a cow giving milk.

Sugar mangels are valued for pork production, the Rose type being recommended, as the sugar content is usually higher.

A disease known as Club-root is becoming more or less common on farms where turnip-growing has been long practiced. This disease rarely attacks the soft turnip and never the mangel, sugar beet or carrot.

The spores remain in the ground for seven or eight years, and it is possible to spread these by the transference of parts of affected turnips to other fields, or by the use of manure from stock which has been fed on the diseased roots.

The disease is not introduced through the seed, but is sometimes harbored by allowing such weeds as Mustard and Wild Turnip to grow unchecked.

Control.—Boil all affected roots which are fed to stock. Keep down all weeds. Avoid using manure for roots which may contain the spores.

Liming the soil at the rate of 100 to 150 bus. of air-slaked lime per acre is a remedy. This should be distributed the year previous to sowing and should be plowed under. Avoid using acid fertilizers, as these neutralize the effect of the lime.

To those farmers who desire to cultivate roots the following conclusions are presented:—

That roots, generally, can be raised more cheaply in New Brunswick than in any latitude in which corn and alfalfa form the chief succulent foods.

If it is impracticable to have a silo on the dairy farm then roots are needed as a succulent feed.

The introduction of extensive root-growing into our rotations is one of the greatest improvements practicable to our farm practice. Cultivation of the root crop clears the land of weeds and also makes available a more extended root-range for other crops in the rotation, by means of their extensive root systems.

Fredericton, N. B.

GET THE FARMERS' STORY

Housewives' Leagues are being organized in a great many of the cities, towns and villages of the Maritime Provinces. The idea is a good one, but judging by the line of argument advanced by some of the promoters and members of the leagues, they have a rather restricted—shall we say entirely wrong idea of the part the farmer plays in the high cost of living. We would suggest that the Departments of Agriculture of the various provinces secure the services of a practical woman, who will appear before the various leagues to give the true, concise story from the farmers standpoint. League members have much to learn in regard to the cost of production on the farm.

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

APRIL 24, 1917.

DATES OF ISSUE.

May 8-29
June 12-26

INCREASED FARM PRODUCTION

The Halifax Board of Trade will award prizes for each of four competitions in the following districts of the Province of Nova Scotia.

District 1—Annapolis, Kings, Hants, Lunenburg, Halifax.

District 2—Digby, Yarmouth, Queens, Shelbourne, Guysboro.

District 3—Colchester, Cumberland, Pictou, Antigonish.

District 4—Inverness, Victoria, Cape Breton, Richmond.

EVERY FARMER, who is trying to meet the demands of the year, is urged to enter the competition in the District in which his farm is situated. No entry fee will be charged, but it is expected that each farmer will continue in the competition for a period of two years. Even if you no not win a prize, you should enter if for no other reason than the opportunity it will offer to talk over your farm management with the judges.

The prizes for the first year, in each competition will be:

1st, $50.00; 2nd, $30.00; 3rd, $20.00; 4th, $15.00; 5th, $10.00; 6th, $5.00.

Prizes will be awarded on the basis of the judges' report upon the following particulars:

(a) Best yield per acre of any three of the following crops; wheat, oats, beans, potatoes.

(b) Largest proportion of cereals and hoed crops to hay land.

(c) Condition and numbers of live stock.

The following committee will have charge of the competitions:

M. Cumming, Secretary for Agriculture; S. J. Moore, Dominion Seed Inspector for the Maritime Provinces; F. L. Fuller, Superintendent of Agricultural Societies and Associations.

ENTRIES may be addressed to F. L. Fuller, Truro, or E. A. Saunders, Sec. Board of Trade, Halifax, and should be mailed not later than June 1st. Write to either of these gentlemen for further information.

NOTES: Next to fighting itself, the most important contribution that can be made towards winning the war is food supplies.

Proportion of crop acreage—not total acreage—counts. The small farmer has as good a chance to win a prize as the large farmer.

There should be very large number of entries from each district in this competition.

TO THE DAIRY COW

W. E. Vaplon, State Leader Boys' and Girls' Clubs, Colorado Agricultural College, Fort Collins, Colorado, gives the dairy cow the following tribute:

The dairy cow, long may she wave her fluffy tail her hide to save from gnat and fly and such like pest that seem to like to break her rest. It's she that brings the monthly check for cream she offers by the peck; it's she that often saves from wreck, the farmer who is wise, by heck! The farmer who's afraid to dig, or who to milk cows is too big, the one who'd rather chew and sit or shoot and spit tobacco spit, the kind whom farming doesn't fit, will keep on going into debt, it's just as safe as spuds to bet, while neighbor Jones with twenty cows will chase hard times to the bow-wows. To farm these days of high-priced land, you've got to plan to beat the band. To meet the price of high-priced tools and self-adjusting milking stools is surely not the job of fools. The farmer who will crop his land each blooming year for all 'twill stand and will not heed the just demand for something in return will stand at last before the judgment bar and wake up with a polting jar. You feed your horse hay and oats, you even feed your lambs and shoats and then you wonder why the land should make a fuss and grow a stand that's not enough to feed ten goats. Put back into the soil, my friends, some of the elements it lends. Remember 'tis the cow and hog that give your bank account a job, that fertilize your worn-out soil and help the mortgage man to foil.

A DEALER ON WOOL PRICES

At a convention of woolen and worsted manufacturers, held recently in New York, some interesting remarks were made by A. W. Elliot, a member of the firm of Jeremiah Williams & Co., the largest wool dealers in America. Mr. Elliot said:

"I believe that high prices for wool have come to stay for a long time. I do not mean to say that the present famine prices are to prevail during the next ten years. I do believe, however, that prices during the next ten years will average very much higher than during the ten years preceding the war. Hundreds of millions of pounds of wool, which, in the ordinary course, would last on a man's back for three or four years, have been rendered unsless in two or three weeks or a mouth. A great deal of it, I am assured, will never reappear even in the shape of shoddy. Millions of sheep in France and Belgium, in Germany, Austria, Russia, Turkey and the Balkans have been slaughtered to feed the contending armies. The figures from France only are available. In two years her sheep have decreased one-third.

"The great manufacturing districts of continental Europe, France, Belgium, Germany, Austria, Poland are bare of wool to-day, and when the war is over it will take hundreds of millions of pounds of wool to start their machinery, and it will take 1,000,000,000 pounds additional to restore to somewhere near normal the clothing stocks of the people of Europe.

"Just as long as the price of wool and of mutton is remunerative, I look to see an expanding and increasing sheep industry all over the world. You need fear no sudden glut of wool. Taking into consideration that the clip of Australia owing to the drouth is short 175,000,000 pounds of what it was two years ago; that the clip of South Africa is short for the same reason, and to a limited extent the same is true of South America; taking into consideration that vast numbers of sheep have been slaughtered in continental Europe, it will probably be several years before the clip of the world is as large as it was in 1913 and 1914."

Get in touch with your nearest Wool Growers' Association, and enter your wool for co-operative sale. We have no hesitation in saying that you will in this way realize top notch prices for your clip. When you sell your wool in the old way, you get the lowest possible figure for it and the middlemen reaps fat profits that is within your reach, if you grasp them.

ENEMY TAKES NO HOLIDAY, WHY SHOULD PLOUGHMAN?

In an effort to stir the English farmers and workers on the land to a realization of the danger of starvation that, he says, threatens the country, Sir Arthur Lee, Director-General of Food Production in England, a new department created as a result of the intensified submarine campaign, has issued this appeal:

"To all ploughmen and workers on the land: In the trenches German shells come over on Sundays as well as on weekdays. German submarines are just as active on Sundays as on any other day. The enemy takes no holidays. He uses every hour to destroy your country and will your brothers.

"Will you not work every hour from daybreak to dark—weekday and Sunday—for the next few weeks? Your work now may make just the difference between winning the war and losing it."

Sir Arthur's appeal speaks volumes for the seriousness of the food situation in England. "We have got to do our maximum amount of planting by the end of April," he said. "We have got to work Sundays and holidays or our crop will not be a success. It is our best answer to the submarine menace and the sooner the people realize it the sooner will they conquer the danger of starvation."

Sir Arthur is making stupendous efforts to carry out his programme of tilling the soil and planting all the seed possible by the end of April.

We agree with Sir Arthur that every effort should be put forth to raise bumper crops in 1917. The farmers of the Maritime Provinces will do their part. They may take their customary rest on Sundays, but their efforts will be redoubled during the other six days of the week.

Sir Arthur knows the problems that confront the British in supplying food to their soldiers in training and on the field of battle. We trust that the boys who are remaining at home will put forth every effort to make the best use of the golden hours, early and late. On the other hand employers should see that they do not take undue advantage of their men, but pay them a scale of wages commensurate with the hours of labor.

THE WHITE-MARKED TUSSOCK MOTH

Hemerocampa leucostigma. Sm. & Ab.

In New Brunswick, at least three kinds of Tussock Moths occur, Notolophus antiqua, the rusty Tussock moth; Hemerocampa definita, Definite marked Tussock Moth; and Hemerocampa leucostigma, the white-marked Tussock Moth. The two species first named are very generally distributed over the Province, but do not occur in sufficient numbers to cause great damage. The white-marked Tussock, while not so evenly distributed throughout New Brunswick, is a far more dangerous insect than either of the others. It seems to thrive best in towns, villages and thickly populated districts. It is claimed that the reason for this is the protection afforded by English sparrows which drive away the native birds that formerly destroyed the caterpillars of this moth.

Halifax, Charlottetown, Montreal, Toronto, Hamilton and other Canadian cities have had serious outbreaks of this insect during the past few years, and in a great number of the cities and towns of the eastern United States it has been a veritable scourge. White its activities were more marked in the more populous centres, in 1908 very serious damage was done to the apple orchards in some sections of New York State, a number of growers estimating their loss at twenty-five per cent. of the total crop. In the past ten years there have been numerous records of damage to fruit trees by this pest.

Lately, this insect has been increasing very rapidly in south-eastern New Brunswick, and last summer (1916), the Tussock caterpillars appeared in immense numbers in the city of Moncton and vicinity. Throughout the summer they did a great deal of damage to shade trees, and caused much inconvenience to citizens by swarming into houses and places of business. In one or two cases, families had to leave their homes to escape the caterpillars which could not be kept out of the houses.

Life History and Habits

This insect passes the winter in the egg stage. The egg clusters are conspicuous white masses, usually containing from one hundred to over four hundred eggs covered with a hard frothy substance. The eggs hatch in late May or early June and the tiny caterpillors feed upon the soft tissue on the underside of the leaves. As they increase in size they eat holes through the leaf, and when full grown devour every part of the leaf except the main ribs. The larval stage lasts five or six weeks, the caterpillars casting their skins five times. When they are nearly ready to pupate, they sometimes crawl to a considerable distance, and in this way spread to other trees. In July, the caterpillars are full grown and ready to pass into the pupal stage. They form their cocoons on the bark of the trunk or larger branches of a tree, although the cocoons may be found on fences, buildings, telephone poles, etc. The insects remain in the cocoon about two weeks. The male, upon emerging, flies off seeking for a mate. The female is wingless and therefore cannot fly; but while she can crawl a short distance, she usually remains upon the cocoon from which she emerged. She deposits her eggs on the empty cocoon and shortly afterwards dies. The difference between the male and female is well shown in the illustration. These insects do not eat in the adult stage.

Food Plants.—The white-marked Tussock Moth feeds upon a great number of deciduous trees and shrubs, including fruit trees.

Distribution.—It is found from Jacksonville, Florida, to Northern New Brunswick and Quebec, and west to Nebraska and Oregon.

Description.—The various stages of this insect are shown in the illustration. The full grown caterpillar (a) has a coral red head, a pair of long, black plumes just over it, another tail-like plume at the end of the body, four yellowish-white tufts or tussocks on its back and just behind these two small retractile red tubercles. Along the back there is a broad, black band bordered by narrow, yellowish stripes. The sides are dark grey with a black line indicating the position of the breathing pores. Below this the body is yellowish.

The female is about five-eighths of an inch in length, grey and wingless.

The male has feathery antennae and a wing spread of about one and one-quarter inches. The wings are marked with several shades of grey and greyish-white.

The eggs, as already stated, are deposited on the empty cocoon and covered with a mass of frothy matter which forms an effective protection for the eggs.

Tussock Moth in all stages.

Tussock Moth; full-grown Caterpillar.

White marked Tussock Moth.

Remedies

The most effectual methods of controlling this insect are (1) destroying the egy clusters; (2) poisoning the food of the caterpillars by spraying.

One of the most satisfactory and economical remedies for this pest is gathering and destroying the egg masses. In the United States, where this work is done on a large scale, the men use a small hoe blade mounted on the end of a long pole. The egg masses are dislodged by means of this implement, carefully collected and burned, (for if left on the ground they will hatch).

(2) Another method is to wet the egg masses on the tree with crude creosote by means of a sponge attached to a long pole. The creosote destroys the eggs and discolors the egg mass so that it is easy to distinguish the treated from the untreated eggs. This treatment is not effective unless the egg mass is thoroughly saturated with creosote.

While the above methods are advised for the suppression of these insects on the shade trees in towns, for the gruit grower, spraying is preferable. A thorough spraying of the fruit trees with lead arsenate—three pounds to fifty gallons of water—will be found effectual; or better still, spray with poisoned Bordeaux or sulphur, as recommended by the Horticultural Division. By applying this spray early in June, the young Tussock caterpillars are destroyed along with other fruit tree pests, which usually attack the trees at that time.

In New Brunswick last year, the most serious insect outbreak was that of the White Tussock Moth. It was particularly plentiful in the eastern and southeastern counties, doing much injury to fruit and shade trees. This insect when allowed to increase, has proved exceedingly destructive in Canada and United States.. Therefore, the Government desires to draw the attention of fruit growers and others to its presence, and asks for their co-operation in destroying this pest. Every egg cluster collected means the destruction of from 50 to 300 caterpillars. Therefore, gathering and burning the egg clusters is the easiest and most effective method of destroying this insect.

THE N. B. AGRICULTURAL SCHOOLS

Shore Courses During February and March Most Successful

In spite of war conditions and the general scarcity of labour necessitating the presence of every man on the farms that is obtainable, there was a most gratifying attendance of students at the several Short Courses of Instruction arranged by the Provincial Department of Agriculture at Sussex, Woodstock and Chatham.

Although the disorganization of the staff of the Department, due to enlistment, cut down the number of teachers available the Minister was, fortunately, able to secure help from the Federal Department that filled in the gap and brought to the teaching service, men of proven ability and experience in their several fields.

Prof. J. W. Mitchell, Live Stock and Dairy Commissioner, was placed in charge of the arrangements and very much of the success of the work is due to his efficient management and teaching ability. Local co-operation by the leading men of the several districts also helped materially in the furnishing of Live Stock and encouragement of attendance.

In this connection special mention should be made of Messrs. N. W. Eveleigh at Sussex, Peabody Brothers and Frank Peabody and Col. J. F. H. Dibblee at Woodstock and at Chatham of President George E Fisher and practically all the members of the Northumberland Agricultural Society. Here also the staff and students were invited by Mr. R. A. Snowball to use his barns and live stock for practical demonstration work which materially aided the Course, and he further added to the pleasure of the occasion by entertaining all who attended to luncheon at mid-day.

Among the Federal officials who lectured were Messrs. G. C. Cunningham, Dominion Plant Pathologist, the leading Canadian authority on plant diseases and potato growing; G. E. O'Brien in charge of the Sheep Development work for the Maritime Provinces; W. W. Baird, Supt. of the Experimental Farm, Nappan, N. S.; W. W. Hubbard, Supt. of the Experimental Station, Fredericton, and H. N. Flewelling in charge of Cow Testing work in New Brunswick. Mr. Baird has shown himself to be one of the best live stock men in Eastern Canada, and as a demonstrator with horses, cattle, sheep and swine, has few equals in his field. Mr. Hubbard from his long experience with New Brunswick conditions and his opportunities for investigational work, brings valuable information on soil and crop problems and live stock feeding. Mr. Flewelling, who in addition to his official duties is conducting the large dairy farm and herd of Colonel H. Montgomery Campbell, at Apohaqui, and thereby gaining daily experience of immense value to dairy farmers, gave an especially practical address at Sussex.

Prof. Mitchell gave meaty and up to date talks on the importance of live stock husbandry and all branches of dairy work, including not only the technical work of manufacturing, but also the feeding and stable management of dairy cows and the care of milk and cream and manufacture of butter on the farm. He was assisted in the practical demonstration of butter making, &c., by Messrs. N. W. Eveleigh and C. W. McDougall.

Mr. O. C. Hicks took the Cereal, seed growing, root growing, &c., branches of the work, demonstrating with practical work in seed judging selection of roots, &c., for seed growing.

Mr. H. B. Durost talked on Fertilisers and gave practical demonstrations on home mixing, and at Woodstock took up Bee-keeping as well.

Mr. A. G. Turney, Provincial Horticulturist, assisted by A. C. Parker, gave the instructions in fruit growing and took the classes out to nearby orchards for practical work in pruning and orchard management.

Mr. Seth Jones, Provincial Poultry Superintendent, took up all phases of the poultry industry, giving demonstrations in killing and dressing.

Messrs. Cunningham, Turney, Hubbard and Jones illustrated some of their lectures with lantern slide pictures, a feature of the work which seemed to be much appreciated.

Preceding these courses, Messrs. J. W. Mitchell, W. W. Hubbard and N. W. Eveleigh spent practically the whole of January attending Agricultural Society Meetings in various parts of the Province, extending from Bathurst in the north to Elgin in the south.

Remember there are a few matters of detail which, if properly attended to at this season of the year, yield handsome returns. It will pay you to the attention to little things that count.

HORTICULTURE

THE BEAUTIFYING OF THE HOME GROUNDS AND THE GARDEN PLOTS

An Interesting Paper on Hardy Flowering Shrubs Read Before the Fredericton Science Club by Mr. L. C. Box, Horticulturist at Experimental Station.

At the fifth monthly meeting of the Fredericton Science Club, which was held in Fredericton, Wednesday evening, March 14th, at the residence of Professor and Mrs. R. B. Miller, an excellent and very timely paper on Ornamental Shrubs for New Brunswick Gardens was read by Mr. L. C. Box. Mr. Box is the hirticulturist in charge of the work in ornamental and landscape gardening at the Dominion Experimental Station here, and also a fellow of the Royal Horticultural Society of England, and is well qualified to speak with authority on this subject. And, since the subject is one which interests, or should interest, every home, Mr. Box' paper is here reproduced as given:

Paper Read by Mr. Box.

The subject which we have under consideration tonight is, unfortunately one about which very little appears to be known in this province, and, if I can arouse your interest in the planting of hardy flowering shrubs and the beautifying of the home grounds and gardens, I shall feel that I have accomplished something worth while.

The planting of hardy flowering shrubs, whether it be in large ground or small gardens, involves a certain amount of artistic skill in the selection and arrangement of plants suitable for the purpose, no two instances calling for exactly the same treatment. In the case of shrubs, foliage as a rule plays a more important part than the bloom which lasts but a short time at most. Good effects in grouping shrubs generally depend, therefore, upon harmony or pleasing contrast in foliage and, to a smaller degree, on the flowers or fruits. Again, the grouping of certain shrubs which in one instance would produce an artistic effect, would in another look quite out of place; so, therefore, it is necessary to select and arrange the shrubs according to the general layout of the house and surroundings. And let me say that the outlay of money in this connection should not be considered in any way as an expense, but rather as an investment, for, by the judicious planting of trees and shrubs, the property is beautified and made more attractive.

Shrubs Which Bear Fruit.

An argument in favor of planting hardy flowering shrubs which bear fruit, particularly where it remains on the bush during the winter, is that we are co-operating in preserving the balance of nature which man in his unwisdom appears to be constantly trying to upset.

In the development of the flower and in the perfecting of the fruit nature's objective is definite. It may be set forth as an axiom that, in the diversity of form among flowers, nature's endeavor is mainly to insure their fertilization through the agency of the insect world: in the perfecting of the fruit it is toward making it attractive to the birds so as to insure through their agency the dispersal of the seeds. The birds, in their turn, assist in the prevention of a too rapid multiplication of insects, which, if unrestricted, would mean tremendous loss to mankind.

Hardy flowering shrubs develop very quickly and are, therefore, indispensable where it is desirable to make an immediate showing.

A good shrub collection will present the greatest variety of color throughout the season both in flower and foliage. Even in winter many shrubs are attractive because of the gracefulness of their stems and branches and color of the bark. Many varieties also bear highly colored and showy fruit, which, in many instances, hangs on the entire winter.

Preparation of the Soil

I think perhaps it will be as well to say a few words as to the preparation of the soil and planting before speaking of the different varieties. The soil should be thoroughly spaded and enriched with well rotted barnyard manure. The holes should be made of ample dimensions and deep enough so that the roots can spread out and so that the plant will stand in the same position as when growing in the nursery. More trees and shrubs are lost by deep planting than by shallow.

Now take the tree and place in posiiion and sprinkle fine soil among the roots, shaking the tree a little from time to time so that the soil is worked well in. It is important to pack the soil very firmly around the plant so that all the roots will come in contact with the fresh soil. When the roots are well covered, the earth should be tramped firmly. Put in more earth and tramp again. The last two or three inches of earth should not be tramped, leaving it loose for the rain to be taken in. Do not round up the earth about the tree lest the water run off. Often failures are prevented by mulching the new planting with decayed leaves or well rotted manure so as to preserve the moisture in the soil during the dry, hot days and to prevent the alternate freezing and thawing in the winter.

If the weather is dry late in the spring or early in the fall, water may be poured in about the tree; otherwise watering is seldom necessary.

Some Hardy Shrubs.

In making up the following list I have selected only those shrubs which are quite hardy and of easy cultivation. All shrubs mentioned in this list are grown down at the Experimental Station, and if, during the coming spring and summer, any of you would like to come down I shall be only too happy to show you what we have and what we are doing in the way of ornamental gardening. I have taken the shrubs in alphabetical order for convenience, and on the first list is:

Amelanchier, Shad Bush or Juneberry—This shrub or small tree blooms very early in the spring, very often before the leaves appear.

Amelanchier Botryapium is a graceful, slender variety, bearing snowy white flowers in great profusion.

Berberis or Barberry—Of the Barberries, Berberis Thunbergii is perhaps one of the most ornamental. It has handsome shiny foliage, changing to coppery red in autumn. The flowers are insignificant, but are followed by bright red berries in great profusion, remaining on the bush throughout the winter. The shrub is of dwarf habit and is excellent for hedges.

Beautiful at All Seasons.

Berberis aquifolium—The holly-leaved Mahonia is beautiful at all seasons of the year. In winter the prickly shiny leaves take on a bronze and crimson tint. In the spring the whole picture changes and the polished leaves are green once more. It is perfectly hardy, a fairly rapid grower, with attractive yellow flowers in the spring, succeeded by purple berries in the autumn. Altogether it is one of the most satisfactory shrubs grown.

Calycanthus Floridus, or Strawberry shrub, is an old-fashioned, interesting shrub, having a rare and peculiar fragrance of wood and flowers. Its blooms are abundant and of a peculiar chocolate color.

Cornus: Dogwood—Most of you are familiar with the common dogwood, or, as it is sometimes erroneously called, "red willow," which grows freely along our roadsides, so I need say nothing about it, but I would like to call your attention to another variety which is worth growing, Cornus sibirica flaverimmea, which has greenish yellow stems and somewhat larger panicles of creamy white blossoms.

Corchorus japonica, or Kerria, is a handsome small shrub, flowering freely through the summer, bearing single yellow flowers. There is also a double form, the flowers of which are a little deeper in color.

Crataegus, or Hawthorne, is also fairly well known. The sweetly scented flowers are followed by bright red berries.

Profuse Bloomers

We now come to the Deutzias, a group of hardy and easily grown shrubs. All the Deutzias are very profuse bloomers. The following three varieties are especially valuable as ornamental shrubs:

Deutzia crenata fl. pl., an extremely hardy free bowering shrub of upright branching growth, luxuriant foliage and handsome double pure white flowers in erect panicles.

Deutzia gracilis Lemoinei—This is a cross between Duetzia gracilis and Deutzia parviflora and, although retaining to some extent the dwarf habit of the former, it is more graceful and vigorous; the pure white flowers are also larger and more numerous. This is altogether one of the finest of our dwarf flowering shrubs.

Deutzia Pride of Rochester—A tall-growing variety that completely obscures the plant with quantities of pure white double flowers. It is very beautiful and effective, whether grown as a single specimen or in groups.

Earliest Bloom in Spring.

The next shrub, Forsythia or Golden Bell, is one of the very earliest to bloom in the spring, when nearly all other shrubs are still dormant, producing masses of deep golden blossoms, at a time when flowers of any kind are particularly desirable. Two varieties are especially worthy of mention, viz.: F. Fortunei, which blooms in dense masses early in spring, and F. Suspensa, another fine early variety of pendulous habit, covered with drooping yellow blossoms.

Make Money this year from your "Sugar Bush"

Hundreds of farmers to-day make more profit from their "SUGAR BUSH," with less time and labor, than they do from any other crop on the farm.

The demand for Maple Syrup and Sugar is greater than the supply, therefore, prices are good and there is always a ready market.

If you have Maple Trees on your farm which you are not tapping, you are losing good money. Maple Trees always produce a fair crop. They need no care of any kind, yet, each year produce more, and are tapped at a season when you cannot do other kind of work.

WRITE TO-DAY, and let us tell you how to make the most out of your Maple Trees with the least time and effort.

Write NOW for FREE information.

Try an Ad in the FARMER

After the Golden Bells we have the Silver Bell or Halesia tetraptera, also called Snowdrop Tree. This is a beautiful flowering shrub producing, as soon as the leaves appear, a great number of large crowded clusters of beautiful pure white bell-shaped flowers.

The Hydrangeas hardly call for any comment as there are quite a large number planted in and about the city.

We next come to the Bush Honeysuckles, three varieties of which are worthy of note:

Lonicera Fragrantissima—A handsome shrub of strong growth bearing fragrant white flowers early in the spring.

Lonicera Morrowi has a rather more spreading habit of growth than the preceding. It also bears white flowers in the spring, followed by numerous bright red berries until the fall.

Lonicera Tatarica, or Tartarian Honeysuckle, has bright pink flowers in early summer, followed by orange scarlet berries in the fall.

An Old Favorite.

We now have to consider one of the most important flowering shrubs grown, and that is the Philadelphus, frequently called Syringa or Mock Orange. It is an old favorite on account of its fragrant beautiful white blossoms produced in great profusion, whether planted in partial shade or full sun. Most of the members of the genus are hardy and easily grown, requiring very little attention when once established. If pruning is needed it should be done after flowering, since the flowers appear on the wood formed the previous year. Usually propagation is by hardwood cuttings or by suckers and greenwood cuttings under glass; also by layers and by seed, but when several species are growing together they are likely to hybridize.

Bouquet Blanc is a comparatively new variety of vigorous upright growth. The flowers are almost double and are produced in dense clusters. In effect it is not unlike the Japanese Snowball.

The Fragrant Syringa.

Coronarius is the well known fragrant Garland Syringa, and is, undoubtedly, one of the best flowering shrubs we have. It grows to a height of ten to fifteen feet and is absolutely hardy.

Grandiflorus—The large flowered Mock Orange is a more robust growing form of the preceding variety with larger, more conspicuous flowers.

Lemoinei, another variety of this group, growes to a height of six feet and produces small fragrant flowers of a yellowish white color, which completely cover the bush.

Another important group is the Spiraeas. All the Spiraeas are valuable for their easy culture and floriferous character and their adaptability to widely varying conditions.

Spiraea arguta—This variety is one of the earliest and most graceful of the genus. Its slender branches become covered with innumerable pure white tiny flowers early in the spring.

Bumalda—A dwarf Japanese variety of vigorous growth, having pink flowers in July.

Callosa—Grows freely and flowers nearly all summer. Deep rose.

Anthony Waterer—Brilliant rosy carmine flowers borne in dense clusters all summer.

Opulifolia—Strong growing shrub with white flowers in small panicles along the stem.

Profusion of White Clusters.

Van Houttei—By many this is regarded as the finest of all Spiraeas, and it is assuredly one of the most esteemed shrubs in cultivation. It forms an erect bush with graceful arching branches, well covered with neat rich green foliage and, in early summer, a profusion of large pure white flower clusters.

Sackville, N. B.

Syringa or Lilac—Everyone is familiar with the Lilac, but few are acquainted with some of the choicer varieties. The following varieties are among the best:

Jacques Calot—One of the finest lilacs, having very large panicles of delicate rosy pink flowers. The individual flowers are usually large.

Marie Legrave—Large panicles of white flowers; the finest white lilac.

Madame Casmir Perier is a particul-

Madame Casmir Perier is a particularly fragrant variety, bearing large panicles of double creamy white flowers.

I need say nothing about the Viburnums, as nearly everyone knows the Snowball or Guelder Rose and the High Bush Cranberries.

The Weigelas are a useful group for decorative purposes. They thrive in moist and partly shaded situations. Weigela hybrida Eva Rathke is, probably, the best selection, having brilliant crimson flowers during the summer.

Before I close, I think it will not be out of place to say a few words about Roses and their cultivation, as the Rose may be fairly classed among the flowering shrubs.

The first step is to select, if possible, an open situation, i. e., where the plants will get plenty of air and sunshine, yet sheltered, also from high winds. The rose garden must not be situated under the branches of trees and should be placed well away from all tree and shubbery growth.

A south-eastern exposure is, probably, the ideal one in which the rose garden will reach its fullest development.

The ideal soil is what may be termed a clay loam, but it should be sufficiently porous to permit the ready drainage of surplus water. The beds should be properly dug to a depth of eighteen inches and well rotted barnyard manure thoroughly incorporated with the soil. If the plant has been budded low say within two or three inches of the root, it should be set so that the junction of top with root stock is about one to two inches below the surface of bed. The roots should be carefully spread out, fine soil worked in around them and tramped down firmly, leaving the top

DAIRYING.

JUDGING DAIRY COWS BY QUALITY OF THEIR UDDERS RATHER THAN BY THEIR SIZE

The word skeleton brings to mind the framework of bones that supports an animal in its characteristic form. But there are animals that possess a definite form yet have no bones —worms, for instance. There surely must be something in worms that gives support and form to their bodies. Protoplasm, the living substance out of which animals are made, is much like the white of eggs in many ways. So it is easy to see that an animal made of nothing but protoplasm would have just about the shape of so much water—the form of which depends on the receptacle containing it. It is this way with animals and with all parts of animals.

The "receptacle" that contains the protoplasm out of which the animal is composed is the thing that gives form and support to the animal. The "receptacle" is called the connective tissue framework and for the greatest part it is composed of lifeless material. Its structure is fibrous, much like a sponge cut to the shape of the animal in question. If some parts of this sponge-like framework are impregnated with lime salts they will be hard and called bones. The remainder of the sponge-like framework is of use in connecting all parts of the body and holding them to the bones. For this reason it is called connective tissue. So it is seen that an organ like the udder of a cow has a skeleton or connective tissue framework composed mostly of lifeless fibres and just as powerless to produce milk as the hair on the end of the cow's tail. But if this framework were suddenly removed the soft, living, milk-producing parts of the udder would have nothing to cement or hold them together and they would drop off and spread out on the ground just like a monster pancake.

The quantity of glandular or milk producing tissue in proportion to the quantity of connective tissue determines the quality or texture of the udder.

It is not uncommon to find a large udder on a cow that is a small milk producer. At other times a small udder will produce milk exceeding in quantity that of the large udder. Such conditions do not hold with the idea that the quantity of milk depends on the size of the udder.

A large udder may have in its composition a superfluous amount of connective tissue. That is, it consists largely of framework and that lifeless framework can not produce milk. In such cases the glandular or milk-producing parts seem to occupy a position of secondary importance in so far as bulk is concerned at least. Of course, udders of this nature have bad texture, although from a superficial examination they may appear to possess many of the points that a good udder sh uld have.

The surprising condition of small udders secreting an abundance of milk is accounted for by the fact that these small udders have a small amount of connective tissue framework, possibly just sufficient to hold the parts together and preserve the form of the gland while the glandular elements are in a state of high development. Such udders have good texture, although their form may be greatly defective when compared to the ideal.

The quantity of glandular substance determines the quantity of milk produced; the more glands the more milk.

The milk glands of a virgin animal are greatly undeveloped and they do not reach their most productive state until after the lactation period is well established.

If the gland is empty it should look empty. Good texture permits the skin to fall in many loose, oily folds, which are not conspicuous if the texture is bad.

To the touch the skin is thin, oily smooth and soft. It will stretch easily and does not cling to the body of the udder. When the texture is bad the skin is thick and heavy and is too firm under pressure from the fingers.

If pressure from the hands is brought to bear on the sides of the udder, something concerning the character of the deep parts can be discovered. The quality is bad if the center of the gland seems to be a hard mass of unyielding tissue. Various diseases and injuries may cause hard lumps, abnormal growths of connective tissues which contribute to the worthlessness of the organ because they cannot make milk and they crowd out the tissue that can. Not infrequently hard, plate-like formations of a bony nature can be felt in the connective tissue just beneath the skin. On the other hand, an udder in the fully secreting state shows its good texture by a delicate softness that is characteristic. In the lower parts just above the teats it is extremely light and soft and yielding, while throughout the upper part it is firmer but spongy and elastic. No place are there any lumps or solid compact masses.—V. E. LeRoy in American Exchange.

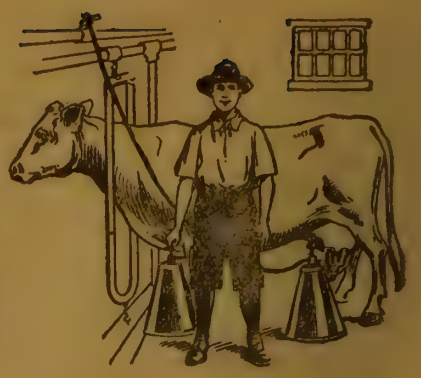
FEEDING DAIRY COWS FOR THEIR MILK AND VITALITY

The failure of cows to breed regularly is becoming more common from year to year, and on many dairy farms is dissipating the profits. This lack of vital power, for such it seems to be, is more prevalent on farms where large quantities of purchased concentrates are fed to the cows than on farms where the cows are fed more farm-grown feeds. Cows that must be bred several times before becoming pregnant seldom freshen at the desired season, lessen the supply of milk when needed, and cause a general upsetting of the dairy farmer's plans. In extreme cases abortion sweeps through the herd and ruin the better cow.

It is not the intention of the writer to pose as a medical expert, but rather to call attention to the importance of proper feeding to maintain the reproductive powers of dairy cows. It is claimed by many dairy experts that in the case of heavy-milking cows the cause of shy breeding is the fact that so much of their feed goes to make milk that the reproductive organs are improperly nourished, and therefore too weak for maternity. This condition, however, is greatly intensified by improper feeding, so that after all it brings us back to the question of rational feeding. Unfortunately for the dairy farmer, the feeds that have the greatest value in producing an abundant flow of milk are the very feeds that have the lowest value in supplying nourishment for the reproductive organs. Consider the milk-giving value of cottonseed meal, then consider the dairy cows that have fed upon it until they are worthless in the dairy herd. Other foods have a similar though not so noticeable an ecect. All highly concentrated protein by-product feeds are dangerous unless properly supplemented with other feeds that are valuable in supplying nourishment for the productive organs. It is to be regretted that these concentrated feeds are so deficient in the elements needed to build up the organs of maternity.

On many farms the trouble is not the result of heavy feeding of these protein concentrates, but not feeding enough of any nourishment feed. Such a policy means a loss at both ends and wipes out every possibility of profit. Between these two extremes there is a proper system of

"Walter would rather stay home and milk than go away on a picnic!"



HOW to get along with less hired help, and yet escape the drudgery that drives boys away from the dairy farm—this is the problem that is being solved by the

EMPIRE Mechanical Milker

No one seems to like hand milking, yet every boy loves to run a machine. Here is a typical example of how it works out:

AMHERST, N.S., Jan. 5, 1917

Dear Sirs:—

Walter, who was 16 years old, loves a machine, but hated to milk cows, so we bought the Empire Milking Machine that was shown at the Winter Fair at Amherst in 1915. It has given good satisfaction in every way.

We have milked at the rate of 40 cows an hour, but think it best not to exceed 32, as that leaves very little stripping to do.

One cow that only gave 21 quarts the year before, gave 29 quarts with the machine; two others that gave 22½ quarts the year before gave 26 to 28 quarts this year when machine milked. We have just one cow that refuses to give her milk down with the machine. The cows are very much quieter when machine milked and sore teats are all done away with. Walter has taken full charge of engine and milker since it was put in and has never missed a milking—would rather stay home and milk than go away on a picnic. GEO. E. FREEMAN

While overcoming the strongest objection to the life of the dairy farmer, the Empire Mechanical Milker is helping hundreds to make more money. Why shouldn't YOU be one of them? Write for Illustrated Booklet and full particulars to Dept. L

G. & C. MERRIAM CO., Springfield, Mass.

feeding dairy cows which provides for an abundance of farm-grown feeds that contain more bulk and less protein than the protein by-products, even though a properly balanced ration is not used. In making up the best rations to insure an abundant yield and a healthy development of the reproductive organs no other grain can take the place of oats. Oats are the best all round feed for dairy cows, and should have a more general use in our rations for dairy cows, even though their use may add slightly to the cost of feeding the herd. The cow cannot turn all the nourishment she derives from the food she gets into milk and still have enough to build up her reproductive organs. We want our cows to breed regularly and must do our share to that end. We must see that our cows have the right kind of feeds to insure their breeding qualities if we are to succeed in the dairy business.—N. M. K.

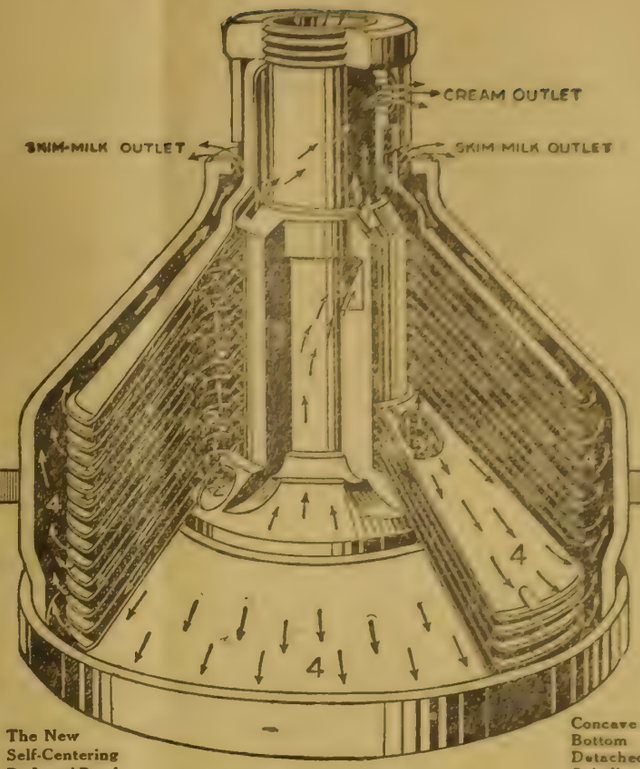
TRAIN THE HEIFER SO THAT SHE WILL BE GOOD COW

There are many practical and quick ways to raise calves and many calves are reared that should have been steered for the butcher's block. It is not safe to assert that a farmer should raise to an adult every calf that is dropped on his farm. As a matter of common knowledge, there is little to be gained by raising calves other than those from the best cows in the herd. Fifteen years ago we bought any number of heifer calves at two dollars each, while the males that this particular dairyman had dropped to his possession were despatched at once. The cost of raising the calf was, in this case, more than the calf was worth. In these days of high prices, there is quite a tendency for city folks to express themselves as of the belief that there should be a law prohibiting a man from doing ought else but raise his calves until they are at least two years ago. This would not be wise. When people will pay enough so that it pays for the raising, the calves will be coming along all right. Unquestionably now is the time to raise the heifers from the best cows. With good grade cows selling at not less than $100, calf raising becomes lucrative once more.

There are five details that I try to bear in mind when rearing a calf. "The proof of the pudding is in the eating" and my results bear me out on the following points:

1. Feed regularly.
2. Give milk always at the same temperature.
3. Supply feed in the same condition.
4. Keep the calf pails clean.
5. Feed grain as soon as the calf iwll eat it.

I believe that regularity is a valuable asset in calf raising. I believe that the temperature cuts some small figure but the condition of the feed is more important. Calves do well on sour milk, if that is what they get regularly but a nondescript combination of sour and sweet milk is pretty sure to be a trouble breeder. Calf pails cleaned once a week should be washed seven times as often, and this is especially true in the summer or in warm weather. Each calf ought to have a separate pail. If a group of calves are allowed to drink out of a washtub "might makes right" and the little ones suffer when they are most in need of feed. This results in the larger ones growing faster and faster in proportion until the small ones cannot get any feed at all. Under such conditions, one should make no complaint if fatalities occur in the "light" class, but it rather singes the conscience when it occurs to one that those little fellows were literally starved out.



The New Self-Centering De Laval Bowl

Concave Bottom Detached Spindle

The Supremacy of the NEW DE LAVAL

THERE may be some question as to who makes the best wagon or the best plow or the best watch, but when it comes to cream separators the supremacy of the De Laval is acknowledged at once by every fair minded and impartial man who is familiar with the cream separator situation.

Thousands and thousands of tests, the world over, have proven that the De Laval skims the cleanest.

The construction of the New De Laval keeps it in a class by itself.

It outlasts and outwears all other makes by far, and can be run with much less cost for repairs.

The world-wide De Laval organization, with agents and representatives in almost every locality where cows are milked, ready to serve you, insures that the buyer of a De Laval will get quick and valuable service when he needs it.

More De Lavals are sold every year than all other makes combined.

The New De Laval has greater capacity than the 1916 style, is simpler in construction, has fewer and interchangeable discs, is easier to wash, and the skimming efficiency is even greater.

Each New De Laval is equipped with a Bell Speed Indicator.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below.

New Catalog will be mailed upon request

MONTREAL PETERBORO WINNIPEG VANCOUVER
50,000 BRANCHES AND LOCAL AGENCIES THE WORLD OVER

There is a tendency in these times of dollar grain to stint the calves and grow them less rapidly. One may well remember that if a calf is worth raising at all, he is worth raising well. Early gains are economical ones; this has been proven many, many times. A pound of grain will put more flesh on a calf than it will on a two-year-old and so there is no economy in stunting the calves even though grain is high in price. The tenth day I put a few grains of corn into the calf's mouth and if this is done regularly, by the sixteenth day most calves will eat their feed without any coaxing. Especially for winter feeding, if calves get skimmed milk and corn and all the clover hay they want, they will make rapid and economical growth.

It often takes patience and perseverance to be a good calf feeder, but present prices for cows pay well for these two qualities. The rules I have outlined have given me good results with no fatalities, and I recommend them for the consideration of others who like sleek, shiny, strong, scampering calves.—I. M. Matthews.

LIVE STOCK.

SHEEP DIPPING

Do you dip your sheep? If not we dare say at shearing time you found your sheep infested with vermin. Did you ever watch a vermin infested flock of sheep and see how restless they act? How they rub themselves against fences, feed racks, etc! How they bite at their side and pull the wool until in some cases, they become almost denuded How they suffer! Suffering, as they do, they cannot thrive, and spring finds them in an emanciated condition. The loss at lambing time is greater than it would be if the ewes were strong and giving a bountiful supply of milk. Why not dip your sheep this summer and thus give both ewes and lambs a chance to thrive? The process is quite simple. If you follow the following rules you cannot go wrong in this respect. See that the preparation is properly mixed and the correct quantity of water is added. Don't guess at it.

Never hurry the dipping. always take care that every sheep is kept in the bath more than two minutes.

Have the bath well and regularly stirred up from the bottom always before beginning to dip, and whenever any stopage occurs.

1. The best time for dipping is from one to three months after shearing.

2. The sheep should not be over heated or thirsty at the time of dipping.

3. If the sun is very hot, it is better to have the draining pens under shade.

4. If the nights are cold the dipping should always be stopped soon enough to allow the sheep some time to dry before sunset.

CARE OF SOW AND LITTER

The proper care of the brood sow and her young litter has a good deal to do with getting a good start towards making money out of the finished hogs. Between farrowing times and while the sow is carrying her litter, she should be well fed with flesh producing foods that will build her and her offspring up, big and strong without too much fat. The sow's food in summer should largely be green food-pasture, clover, alfalfa, rape, etc., and a good part of her winter ration should be clover, alfalfa and roots, which will cheapen the cost of her keep considerably.

As farrowing time approaches, it may be necessary to increase the meal ration. This can be decided by the appearance of the sow, some litters being in greater drain on the system than others. In such cases more meal should be fed. As farrowing time draws near laxative food should be fed, which will tend to produce milk for the youngsters, clear the channels in the sow and produce natural conditions. The sow whose system is in proper condition will very seldom eat her young, or become so stupid that she will lie upon them.

If she is farrowing in cold weather, a little precaution should be taken until the pigs become dry or have nursed once. A good plan is to set a jug of warm water or some warm (not hot) bricks into a feed basket, partly filled with chaff, and put the little fellows into the basket as fast as they arrive. The warm jug and chaff drys them off quickly and keeps them out of danger until they gain strength enough to go as they wish.

The sow should be fed very sparingly for a few days and that mostly in the form of drink. An opening large enough for the little pigs to pass through should be made leading from the sow's pen into another pen, or into the passage way, where the little pigs can go for exercise, and where they can soon be learned to drink milk or gruel, thereby removing a great drain upon the mother, and greatly assisting the growth of the litter.

If there is no hurry to breed the sow again, the pigs are just as well to be left upon their mother until 10 weeks of age, unless the sow gets cross with them and will not let them suck. But they are just as well weaned younger. If the practice of feeding them in a pen by themselves is practised they shouldn't get a set back when weaned. They should then be fed milk and middlings if possible about four times a day for a few weeks, with a little finely ground mixture of oats, barley, wheat and peas. If no milk is available, a little tankage is a splendid substitute; oil cake fed in small quantities give gool results.

R. H. H.

RAISING ORPHAN LAMBS IF RIGHTLY DONE WILL REPAY THE SHEEPOWNER

Just because a lamb is an orphan does not mean it cannot be raised, although I believe the raising of orphan lambs should not be recommended on a large scale. Too often the lamb is the plaything of a farm boy or girl and when such is the case the lamb generally puts up a haggard appearance. When I have an orphan lamb on my hands my first thought is this: Is there a ewe in my flock that has recently lost her lamb? If there is such a ewe in the flock, then we can usually deceive her by taking the skin off the dead lamb and putting it on the orphan. In about nine cases out of ten the ewe will take the lamb and claim it as her own in very short order. Although this scheme does not always work, yet it is the most successful method we have ever used in getting ewes to own lambs that are not their own by birth.

In the absence of a more efficient method we have no complaint to make against the above. After a few days the pelt may be removed without any great danger of the ewe renouncing the lambs. In our flock we endeavor to make every ewe raise a lamb. Ofttimes in the absence of orphans we place with a ewe that has lost her lamb, one of the pairs of twins belonging to some other ewe. We have many ewes with twins that are only able to suckle one lamb and do it well.

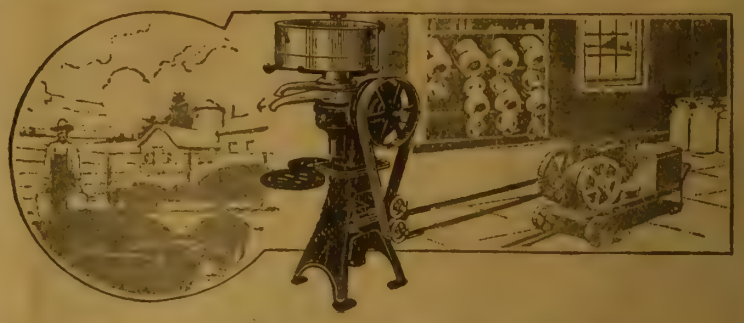
If there is no chance to place an orphan with a foster mother, then it will have to be raised by hand and on milk from a cow. A cow that has freshened lately is no doubt the best place to secure the milk. Many people believe and practice the idea of diluting the milk with equal parts of water. Personally, I have never seen fit to follow this practice, because ewe's milk contains more total solids than cow's milk and also a higher percentage of fat and sugar. Moreover we have fed lambs very successfully with whole milk from the cow. The first week of the orphan's life we always try and feed it on the milk from some ewe. We always have some ewes that are very heavy milkers and if they have only one lamb and it is young, that is a fine place for an orphan to get a meal. Heavy milking ewes should be watched carefully right after they lamb to see that the milk is out of their udders as least once a day, otherwise there is a chance of the udder becoming inflamed and ending up in a case of garget.

When we begin to feed the lamb cow's milk the first day we give just two tablespoonfuls. This is given at intervals of every two hours, thus feeding often and in only small amounts. The equipment necessary in caring for an orphan lamb is a long-necked bottle and a swan bill nipple. As times goes on and the lamb grows older the amount of milk can be increased and by the time the lamb is three weeks old, three or four feedings each day are enough.

We also believe in getting the little fellows to eating grain as soon as possible. When they are two weeks' old they will nibble the leaves of alfalfa or pea hay. In fact, this is about the first thing our lambs eat. Soon they learn to take bran, oats and a little linseed oil cake does not hurt them any. Getting lambs to eat grain and hay helps wonderfully in supplementing milk and they will thrive on these feeds. By the time they are a month old, they will being eating appreciable amount of hay and grain and they may gain as much as a half a pound a day for the first three months. By careful feeding the haggard appearance which the orphan lamb generally presents can be prevented. I have known orphan lambs that were well grown to be the foundation for many a farm flock.

HOW ONE BOY SUCCEEDED

During the very many years in which I was especially interested in sheep, I obtained quite a little first-hand information in caring for orphan lambs. In fact, it was through one of these unfortunate creatures that my introduction to sheep husbandry began. Until I was about 10 years old my father had kept cows but had never kept sheep. At that



Make Your Dairy Pay

EVEN though you have no more than two or three cows, there are good reasons why you should have a **Primrose** cream separator. The **Primrose** has a record of skimming out all the cream except the last drop or two in each gallon of milk.

Of the many reasons for this close skimming, we can mention only two good **Primrose** features — the double cream outlet and the regulating screw in the skimmed milk outlet. It is important that the cream have a free outlet from the bowl, plenty of room to escape without cutting or crushing the large fat globules which make such smooth, rich butter and give quality and value to the cream. Therefore, we not only place no screw in the cream outlet, but we provide a second outlet as large as the first. Through these the cream finds easy passage after its complete separation in the bowl.

If a less dense cream is wanted, a turn of the screw in the skimmed milk outlet forces a thin edge of skimmed milk into the cream channel, thinning the cream but not interfering in any way with the closeness of the skimming.

These and other valuable **Primrose** features are fully described in catalogues which we will send promptly. Write us for them, addressing the nearest branch house.

BUTTER PARCHMENT
Printed or Plain, at the Maritime Farmer Office

time a neighbor who had a flock of good sheep, gave him a lamb lost or that had been disowned. It was raised by hand and became a fine sheep. Its descendants were kept and in the course of a few years quite a little flock was formed.

The lamb that must be cared for without aid from its dam should be kept in a large box in the barn or in some other comfortable building. In order to save time and steps, this should be near the house. If the lamb is chilled when it is found it should be thoroughly warmed by the fire, or by rubbing with a dry cloth and should be given a very little warm milk. The box should be supplied with bedding and this should be changed frequently so as to keep it clean and **dry.**

At first the lamb must be fed with a spoon or from a bottle having a rubber nipple. If the latter is used it must be kept scrupulously clean. After it has gotten a fair start the lamb can be taught to drink. This is best done by putting one's hand in a dish of milk and letting the lamb suck one of the fingers. Some lambs learn much more readily than others but all can be taught. At first, feeding should be little and often. Cow's milk should be given at intervals of five or six times each twenty-four hours, the first feeding being early in the morning and the last as late as ten in the evening.

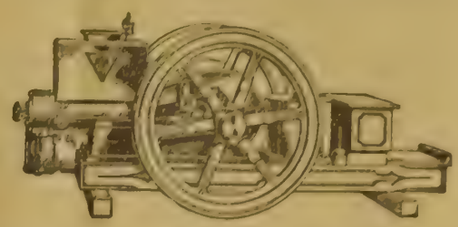
As the lamb grows it can take more milk at a time and will not need feeding so often. It is important to give the milk of only one cow, and one that has freshened recently. The milk of a farrow cow is too constipating. If it must be used, water and a little molasses should be mixed with it. Milk should always be warm when it is fed but over-heating must be avoided. When it has learned to drink, the lamb should have access to clean water and while it is quite young it will like, and should be given, a little fine hay as part of its daily food. It needs exercise but until it is several weeks old it should not be out-of-doors in bad weather. Feeding of milk should be discontinued gradually. The time when the lamb should be put with the flock will depend upon its size and strength and the readiness with which it eats hay.

Efforts of this kind sometimes fail. Many times they succeed. They are worth making when it is a question of certainly losing, or possibly saving, a good lamb. J. E. R.

CASTRATING LARGE BOAR

Subscriber asks for method of handling a 600 lb. boar for castrating.

In securing large boards for castration, the difficulties to contend with are the great strength of the animal compared to its size, and the awkward shape of the animal for handling. It is therefore necessary to use a form of restraint to take advantage of them, and which will be egective in controlling them. The best method is to first secure the boar by means of a rope noose in the mouth. A loop of ½ or ¾ inch rope is next placed over the neck and one front leg, so that the loop of rope is behind the shoulder on one side. The free end of the rope should then be passed up over a beam overhead. The hog should then be drawn up so as to keep the front feet right up off the ground, and kept in this position until the operation is completed. By this means any large boar can be easily handled and rendered entirely helpless. In doing the castrating the testicles should be firmly grasped by the hand and a large incision made on each side of the scrotum to expose the testicles. The testicles are then drawn out of the scrotum with the hand and removed with an emasculator, which crushes the cord and prevents bleeding.



ALPHA GAS ENGINES
are "trouble-proof"

You won't find in the ALPHA any of the complicated, delicate parts that cause so much trouble in some engines.

The ALPHA is built for SERVICE. It contains just as few parts as can possibly be used, and every part is strongly made of the best materials obtainable, accurately machined and perfectly adjusted.

You can always rely on an ALPHA to do its work when you need it. It starts and runs on a simple, low-speed magneto and there are no troublesome batteries to watch or fuss with, or to wear out and require renewing. Simply turn on the fuel, give the flywheel a pull and the ALPHA is good for an all-day run.

If you want to saw wood, run a feed grinder or cutter, a cream separator, a pump or a washing-machine, the ALPHA is always ready to do the work—and do it at the lowest fuel cost.

It runs on either gasoline or kerosene, and the sensitive governor prevents any waste of fuel due to changes in load.

Made in eleven sizes, 2 to 28 H. P. Each furnished in stationary, semi-portable, or portable style, and with hopper or tank cooled cylinder.

LOSSES AMONG YOUNG PIGS

Subscriber writes: "Sow farrowed, had thirteen pigs, and all have died but four. She was fed before and after farrowing equal parts of oat chop and shorts. She seemed to have no appetite, sleeps most of the time and is crippled up in the legs as if she had rheumatism.

"The young pigs all were healthy and strong when born, but gradually got thinner and weaker till they died."

Losses, such as you describe, occurring among young pigs a short time after birth, are usually the result of an acute gastritis, or inflammation of the stomach, due to some irritation. The irritation is usually caused by some improper element in the sow's milk, as a result of some constitutional trouble affecting her. The fact of your sow being troubles with rheumatism shows that she is affected with some constitutional ailment, which would make her milk harmful. In a case of this kind, the young pigs are better taken away from the mother and raised artificially on cow's milk. For the first week, or until they learn to drink, they would require to be fed from a bottle. They should be continued on the cow's milk and shorts, until ten weeks old, and then gradually change their diet to shorts and crushed oats. The sow should be given a dose of castor oil, or raw linseed oil. She should also be given a spoonful each of salicylate of soda and bicarbonate of soda, each night and mornin, in her feed. She should be fed on a sloppy diet of milk and shorts for several weeks.

MAKING BACON

Subscriber, writes,—"Will you kindly give me a recipe for making 'spice rolled bacon,' and name the spices to be used?"

Take your fresh side of bacon and sprinkle over it a mixture of ground spices, such as allspice, cloves, cinnamon, pepper and salt, through the flour sifter, so they will be well mixed. Mace and a pinch of savory can also be added if desired. Roll up the bacon, tie with cord and let stand overnight. The next day boil till tender; drain and serve cold.

PAINS AFTER EATING

WIND IN THE STOMACH—ACIDITY, HEADACHES—CONSTIPATION

ARE SIGNS OF INDIGESTION.

Indigestion—the complete or partial failure of the digestive processes—frequently throws out of gear the whole machinery of the body. You can't enjoy the vigour and vitality of good health unless your stomach, liver and bowels do their work regularly and efficiently.

MOTHER SEIGEL'S SYRUP

As a digestive tonic and stomachic remedy, Mother Seigel's Syrup is esteemed in tens of thousands of homes, wherever the English language is spoken. If you suffer much or little from disorders of the stomach, liver or bowels, try the effect of taking 15 to 30 drops of this famous remedy in water, after meals, for a few days and note its beneficial effects.

THE HORSE

REMEDIES THAT SHOULD BE KEPT IN EVERY FARM BARN

Nail prick—Part out punctured place well, inject turpentine, pack foot tar. Dress twice daily.

Barbed wire cut—Stop bleeding (bandage or pinch arteries), dust on boric acid. Dress twice daily. Use tincture of iodine and glycerine in equal parts to check proud flesh.

Sore shoulder in horses—Have collar fit, not too large. Use clean, dry pads; no pads are better. Wash shoulders every night with salt water. Use zinc oxide ointment.

Sweeney—Caused by a poorly fitting collar on a young or green horse. Apply four parts lard and one part turpentine, or a liniment. See a veterinarian.

Strangles, distemper—Good care, shelter. Coax the appetite, laxative food, no purgatives. See your veterinarian.

Azoturia or Monday morning disease—Horses exercised daily seldom have it. Comes on after a few days of rest. If the horse becomes crampy on exercise and falls down, stop at once and blanket him. Get expert advice.

Joint-ill in colts—Keep colt in clean place. Twice daily dip cord in equal parts tincture of iodine and glycerine.

Colic in horses—Call a veterinarian at once. While waiting give one quart raw linseed oil and four tablespoonfuls turpentine by the mouth. Follow with four tablespoonfuls aromatic spirits of ammonia in three cups water every two hours as a stimulant, if necessary. Turn horse free in box stall or corral.

Worms in horses—Give one quart raw linseed oil with one-half cup turpentine on an empty stomach. Repeat in a week if necessary.

Bloat in cattle—Give three tablespoonfuls each of turpentine and aromatic spirits of ammonia in three cups water. Repeat every two hours if necessary. Tap on left side if bad.

Milk fever—Inflate each quarter of udder with air. Boil teat tube before using to avoid infection.

Caked udder—Apply hot water frequently. Massage, following with application of zinc oxide ointment.

Lice—Wash, spray, or dip animals in two percent solution of Creolin or Zenoleum in soft water, or dust on lightly sabadilla powder.

Blackleg—Burn carcasses. Vaccinate all cattle from one month to two years of age, April 1 and October 1.

Drenching a horse—Back him into a single stall, use a loop of ropes or hame strap in the mouth, throw rope over a beam, pull head up until mouth is on a level with his eye. Drench slowly by the mouth.

Clean up buildings after hog cholera and other contagious diseases. Clean out all dark corners. Spray or wash all parts of pens or stable with three percent Creoline or Zenoleum solution in lime water.

Diagnosis by your veterinarian is more valuable than medicine.—Dr. W. J. Hartman, Livestock Specialist.

MARE WITH WORMS AND THIN CONDITION

I have a 7-year-old mare that raised a colt when three years old and one when four years old. She ran on the grass late in the fall and did practically nothing this winter, she has had worms for some time and is very poor. She gets half a pail of oats and lots of hay three times a day. T. H.

You certainly have kept your mare busy in the way of successive breed-

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY

For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.

Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.

Yours truly, Clarke Bros.

Hubbard's Cove, N. S.

Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.

Yours truly, C. C. McLean.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.

Newton Lee, Owner "All Right" 5817.

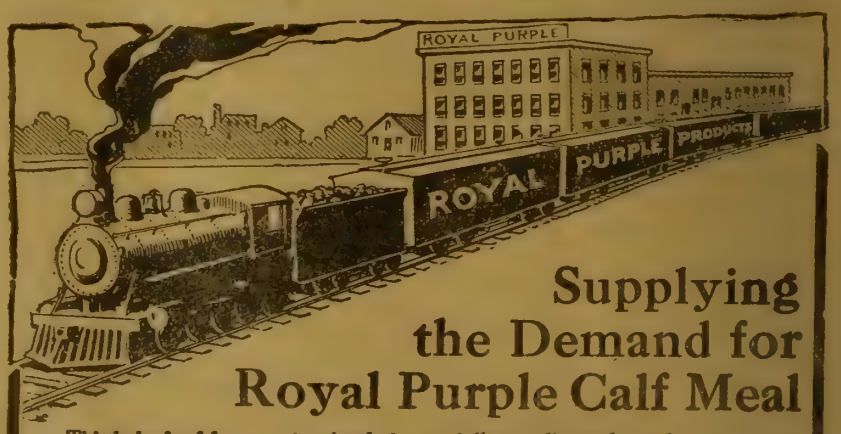
Elmsdale, N. S.

Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

FRASIER THORNTON, & CO., Limited, Manufacturers: Cookshire, Quebec, Canada



Supplying the Demand for Royal Purple Calf Meal

This baby food for young animals is partially pre-digested, and can be fed to the youngest animals with perfect safety. It WILL NOT cause stomach or bowel trouble, which are serious ailments in young animals. Royal Purple is a sure preventive for scouring.

Calves Gain Rapidly Without Milk

When the calves are 3 or 4 days old they can be fed Royal Purple Calf Meal and raised just as well without one drop of milk. What prominent breeders remark:

Mr. Geo. W Collins. Plainfield Ont., writes:

"Gentlemen.—In regard to your Calf Meal, I think you have the best on the market, as people who have bought it give it great praise. Some have taken their calves off sweet milk, and feed them nothing but your Calf Meal and water, and say they are doing as well on it as they did on the whole milk."

To Whom It May Concern: Uxbridge, Aug. 5th

This is to certify that I have secured your "Royal Purple" Calf Meal from our druggist. Mr. T. C. Nicholls. of Uxbridge and can speak of this meal in the highest terms. I have used other calf meals, but this one is the best I ever tried I never saw a calf gain more rapidly and thrive better than mine did while using your "Royal Purple" Calf Meal. I can cheerfully recommend it to all our stockmen who wish to raise large, healthy calves."—Stanley W. Croxall.

Note—The above Mr. Croxall keeps a large herd of pure-bred Holstein cattle and is an excellent authority on Calf Foods.

Royal Purple Calf Meal is equally good for young colts, lambs and young pigs. Put up in 25-lb., 50-lb. and 100-lb. bags. Secure it from our dealer in your town.

W. A. Jenkins Mfg. Co., Ltd., London, Can.

ing at so immature an age as three or four years. If you have worked her hard at the same time you have very likely spoiled your mare for life. To keep horses in first class shape and ability for their duties on the farm, they require more consideration than the average farmer apparently gives. The appearance of the team generally tells the quality of the man, either as a humane individual or as a success as a farmer.

You say she is thin and has done practically nothing all winter. Either you have knocked the "spirit" out of her in her earlier years, or you are not giving her proper attention. There are numerous vermifuges for worms. The most convenient and effectual is the following: I Drachm sulphate of iron, 1 drachm tartar emetic, 2 drachms of linseed meal, mix them together. This quantity will be sufficient for one dose, repeating it morning and night for a week. Give it in her grain feed. After the week is up, give a purgative of oil and turpentine, one ounce of turpentine in one pint raw linseed oil, give as one dose.

Take a pride in having your horses always looking their best and it will pay you. Some horses can stand 15 lbs. of oats a day. .The army ration) and some will do just as well on 8 or 10 lbs. a day; all depends on the digestive faculties of the animals and care of the feede: Divide the grain ration into three meals a day. A bran mash or feed of boiled barley at night will help the mare greatly and if you can afford a little linseed meal, just a handful daily in the oats, it will pay you. Feed her hay often and in moderate quantities. A little clover daily is also a good horse flesh former. Always remember that the horse that is well groomed and kept warm in well ventilated quarters makes the most of its feed. Put a light covering or blanket on the mare, as it will improve her coat greatly and aid in putting on flesh.—O. V. J.

GIVE THE HORSE A NEW SPRING COAT

He Will Feel Good and Fit When He Gets It On

Paint helps the appearance of the farm buildings and so does care help the horse's coat—and the selling price of the farm and of the horse is increased. The general appearance and the comfort of the horse are helped by condition of the coat, which acts as a sort of barometer of the care given it.

Naturally, breeding has some influence upon the nature of the horse's coat. The age of the animal has something to do with it. Horses under five and over ten years of age do not give the same return for care, generally, as do those between these ages. The young horse is in a more or less general feverish condition because of dentition. The old horse is more or less impaired in vitality and the coat as well as other parts of the body will show this condition.

Frequently farmers are heard to say that they don't like gray or white horses because they cannot be kept clean. The reason is that dirt or stains show the more readily on light colored horses. The coat is harder to keep in good condition in the winter because the hair is longer and seems to be lacking in gloss. When horses are kept well sheltered and grooming is regular this gloss, that is especially desired with show and fancy stock, is partially retained. Grooming twice daily, including not only the brushing of the hair roots with and against the grain will assist greatly in removing dust and dandruff.

Whenever a horse has been ridden, driven or worked until perspiration is caused, it is well to rub until dry if the condition of the horse as well

Don't Waste the "Golden Nuggets"!

Make every seed-piece count, yet make sure of a full stand. This boy will help you do 100% potato planting, with no doubles and no misses. He will save you 1 to 2 bushels per acre—some say a barrel. He earns his way many times over. You can't afford to do without him. Use the seed-saving

IRON AGE Potato Planter

It plants as fast as the team can walk, spaces the seed evenly and at uniform depth. Has no pickers—nothing to cut or bruise the seed. Spreads the fertilizer and thoroughly mixes it with the soil so that it can not injure the seed. Can be had in two styles with or without fertilizer attachments and with choice of furrow openers.

"The 100 Per Cent Potato Planter"

Write today for booklet fully describing this 100% Potato Planter. We also make a full line of potato spraying, cultivating and garden tools.

Advertise int he Farmer

POULTRY.

PRODUCE MORE POULTRY PRODUCTS

There never was a time when egg production and increased egg production was as necessary as at present. The demand was never as good, and prospects indicate that this demand will continue for some time to come. With the scarcity of meat, Canadians are eating more eggs and Great Britain needs all the eggs that we can supply. Therefore, as a busines proposition, increased production of poultry products should appeal to more than usual.

A Slight Export

For two years Canada has been producing a surplus. During the calendar year 1915, 7,151,031 dozens of eggs, valued at $2,037,294, were shipped to Great Britain. In 1916 the amount exported was 5,481,958 dozens with a value of $1, 892, 843, and there is no reason why the surplus for 1917 should not be from five to ten times what it was in 1916. In normal times Great Britain eats a million eggs a day; she would probably eat more now if she could get them. Canadian eggs are at a premium in England; the prices paid for them have been several cents a dozen higher than that paid for eggs from some other countries.

Increase the Export.

Canada should be able to supply a great many more than she has done. Canadian eggs are good eggs, but we want more of them. We have the climate, we have the feed, and though labour for other lines of work is scarce, there is plenty of labour suitable for poultry-keeping for those who are comparatively old or the younger members of the family are quite satisfactory for this line of production.

Mating and Breeding

It is the early-hatched pullets that make the best winter layers, and it is the winter layers that give the best returns; therefore, the breeding pen should be mated as soon after the first of February as circumstances will permit.

Hatch as many chicks in March and April as possible, so that you will not have to depend on late pullets for your next winter layers.

Breeding females.—Yearling hens make the best breeders. These should not be forced for heavy production through the winter, but should be kept active. If possible, allow them the run of a sheltered barnyard. Keep them not too fat, but in good vigorous condition. If there are not enough yearlings, early-hatched well-matured pullets may be used.

Selecting the breeding females.—Breed from those that were the best layers as pullets. When the pullets are put into their winter quarters in the fall they should all be carefully banded, trap-nested, and records kept of their laying for the four winter months, that is, November, December, January, and February. It is from the pullets that lay best during that period that the breeders should be selected, as experience has shown that those are the birds that will make the best yearly records and will return the greatest profits. If it is not possible to trap-nest, note should be made of the time of starting to lay of each pullet, and those that show early maturity used.

The birds that pass the test of early maturity and the trap-nest should be carefully examined for vigour, and only those that are in perfect health and of fair size for the breed of which they are representatives should be reserved for breeders.

The breeding males.—The first re-

HAD INDIGESTION.

BURDOCK BLOOD BITTERS CURED.

That grand old remedy, Burdock Blood Bitters, has been on the market for over forty years and we claim, without any fear of contradiction, that there is not another medicine on the market to-day that can compare with it for the cure of all disturbances of the stomach.

Mrs. S. Turpin, Colborne, Ont., writes: "I am writing to say that I have used your Burdock Blood Bitters. For a long period I suffered with indigestion, and nothing I took ever gave me any relief, only for a short time. I bought several bottles of B. B. B. from our druggist, Mr. Griffis, and can honestly say I can eat or drink anything I want without experiencing any bad after-effects. I may say that it is the only medicine I ever got any relief from."

Burdock Blood Bitters is manufactured only by THE T. MILBURN CO., Limited, Toronto, Ont.

quisite in a breeding male is that he should have the proper breeding back of him. He should be the son of a heavy winter-laying hen and his sisters should also have shown their ability to lay well in winter.

Besides this he should be carefully selected for vigour. He should be of good size, with a head broad between the eyes and well filled in in front, ending in a stout well-curved beak. He should have a bright, piercing eye, and should stand on legs that are straight, not too long, and that are set wide apart, with no inclination to knock knees. If there is a line of red pigment down the outside of the shanks all the better. With males and females such as described, the results should be satisfactory provided they are housed and fed properly.

Age of males.—A well-matured vigorous cockerel is usuall best. He gives better fertility than an older bird. More hens can be mated to a cockerel than to a cock bird. He should be well grown and matured.

Number of females.—From ten to twenty-five females, depending on breed and condition. Heavy breeds, fewer; lighter breeds, more. The more free range and exercise the more females.

Time of mating.—An egg laid two days after actual mating takes place will be fertile, but to be on the safe side it is advisable to put the male in the breeding pen about ten days before eggs are wanted for incubation. Use some selection, trap-nest if possible, and hatch early.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

INCUBATING AND BROODING

Incubation.

Incubator or hens, which?—It all depends how many chicks you want and whether they are wanted at the one time or not. One hundred chicks or less scattered through the season will be just as well hatched under hens. If more than one hundred, the incubator is the better proposition.

How to buy an incubator.—In buying an incubator buy a good standard make and pay a fair price. The first price of a good incubator is nothing compared with the cost of keeping a poor one supplied with eggs.

Get the incubator ready.—Don't wait until you are ready to set the eggs before you think of looking at the incubator. See that it is perfectly cleaned, disinfected, have all repairs ready and get a new burner. Run it several days before you put any eggs inside.

Where to place the incubator.—A moist, well-ventilated basement is best. Earth or cement floor is better than board. A room in the house may do, but more moisture will be required.

Prepare proper sitting nests.—Trouble and annoyance with broody hens will be overcome by providing suitable nests. These nests may be built in sections large enough to hold three sitting hens. Set that many hens at once.

Put sitting hens by themselves.—compartment as the other hens. Put Don't allow the sitters in the same the sitting boxes in a place by themselves, if it is only a box stall in the stable. On the floor keep water, feed, and a dust bath, allowing the hens out once a day for a few minutes.

Select good eggs.—Use no eggs that are abnormal in shape or size. Discard eggs that have rough shells or that have wrinkles in the shell; also those that are long and thin, or extremely round.

Don't chill the eggs.—The fertility of many eggs is spoiled because of being chilled. The strongest germs will be spoiled if eggs are left in freezing temperature for many minutes. Don't leave them in the nests to chill or standing around in a cold room after you have gathered them.

Test all eggs.—Whether eggs are under hens or in an incubator, test the eggs for fertility on the seventh or eighth day. White-shelled eggs can be tested on the fourth or fifth day.

Brooding.

Artificial or natural.—As a rule, the kind of incubation determines the nature of the brooding. No matter what kind of brooding is adopted, bear in mind that the brooding is even more important than the incubation in that in the brooding so many losses occur.

Artificial brooding.—Have plenty of brooding space. Do not crowd the brooders. Fifty chicks is plenty in the small brooders on the market. Indoor brooders give better results than outdoor brooders. Make sure brooders are clean. Clean and disinfect after every brood. Keep the heat at 95 to 100 degrees. Heat, cleanliness and fresh air are three important factors in artificial brooding.

Natural brooding.—Provide broody coops for the hens with the chicks. Put them in a sheltered and convenient place. Change the coop to new ground every day. Have the coop large enough so that when the chicks are weaned, they can make the coop their own during the rearing period.

Feeding

No set rule can be laid down for feeding, feeds and conditions vary so. The following suggestions are given and may be adopted or altered to suit:—

Chicks.

Chicks should not be fed until they show positive signs of hunger, which

12 GOOD REASONS AND TRUE

1.—POWER almost unlimited. The Gray-Dort will carry you anywhere. Hills—mud—sand—hold no terror for her.

2—PERFECT COOLING obtained by exceptionally large jackets round every cylinder individually and around every valve cage.

3—ABSENCE OF VIBRATION—An extra heavy crank shaft with long and large bearings and perfect balance and adjustment of all working parts.

4—QUICK-GET-AWAY—she responds to the throttle at once. The light motor moves quickly—fires surely.

5—ABSENCE OF BACK PRESSURE—the Gray-Dort has a dual exhaust—rare on four-cylinder cars.

6—FOOL-PROOF CARBURATOR—Adjust it as you will, the motor still runs sweetly and powerfully.

7—ACCESSIBILITY—you can reach the "vitals" of the Gray-Dort easily. This makes cleaning and adjustment easy.

8—EASY DRIVING. Easy gear shift, sure brakes, handy control, sure steering.

9—COMFORT—long springs, deep upholstery; lots of seat room; lots of leg room.

10—COMPLETE—you buy the Gray-Dort complete; Westinghouse starting and lighting, one-man top, speedometer, ammeter, dashlight, demountable rims, non-skid tires in rear, electric horn, tools, everything.

11—LONG LIFE—strength and honesty of construction have characterized every product for which this great manufacturing organization has stood sponsor during 60 years of practical experience—the Gray-Dort is our latest and finest effort.

12—PRICE—only $910 for a completely equipped 5 passenger touring car or 3 passenger roadster of outstanding quality—value far in excess of the price asked.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

LAUGHTER

By Isabella Valancey Crawford.

LAUGHTER wears a lilied gown—
She is but a simple thing;
Laughter's eyes are water-brown,
Ever glancing up and down
Like a woodbird's restless wing.

Laughter slender is and round—
She is but a simple thing;
And her tresses fly unbound,
And above her brow are found
Buds that blossom by Mirth's spring.

Laughter loves to praise and play—
She is but a simple thing;
With the children small who stray
Under hedges, where the May
Scents and blossoms richly fling.

Laughter coyly peeps and flits—
She is but a simple thing;
Round the flower-clad door, where sits
Maid who dimples as she knits,
Dreaming in the rosy spring.

Laughter hath light-tripping feet—
She is but a simple thing;
Ye may often Laughter meet
In the hayfield, gilt and sweet,
Where the mowers jest and sing.

Laughter shakes the bounteous leaves
She is but a simple thing;
On the village ale-house eaves,
While the angered swallow grieves
And the rustic revellers sing.

Laughter never comes a-nigh—
She's a wise though simple thing—
Where men lay them down to die;
Nor will under stormy sky
Laughters' airy music ring.

TABLE SETTING AND SERVING.

The eye and the digestive system are under the same control. The nervous system directs the action of both and what pleases one, pleases the other. No meal is a success unless the linen is clean, the table neatly set and the food neatly served. A suitable text for the discussion of this subject would be "Simplicity and Perfection. A simple meal satisfies because it is well cooked, and because it is served from neat dishes and an attractive table. Try the same meal in some dingy room and see if you like it as well, with heavy, cracked dishes, soiled table cloth, no napkin, and flies without number. You have the same number of foods and the foods have the same names, but while the first meal is most satisfying, number two gives no satisfaction whatever.

Th most valuable among the early housekeeping lessons is the art of table setting, and is a lessen every child of ten should have mastered. This, like every other lesson, must be taught systematically and thoroughly. If definite instructions are given, the art of table setting may be masered with little difficulty.

In setting the table, first cover it with a cloth known as a silence cloth. This may consist of heavy cotton flannel, a thick blanket or a piece of table padding, but whatever kind is chosen, the silence cloth is intended to protect the table, prevent noise and save the table cloth from war.

The linen cloth should be so placed as to leave a margin, which is even on all sides of the table. Have the centre of the cloth exactly in the centre of the table. The cloth should be ironed so that the middle fold has the top of the crease up, while the two side folds are just the opposite. There should be no folds cross wise of the cloth. Place the linen centre piece directly in the centre of the table, and in the centre of this place a fern dish, dish of fruit or cut flowers. The flowers should be so low or so high, that an unobstructed view may be had across the table. Place tray cloth for hostess at edge of table and carving cloth for host one inch from edge.

Placing of Dishes

Whether the meal is simple or elaborate, one of the chief elements of success is the care with which the dishes are placed on the table. The same principles hold true, whether the meal is a simple home meal or an elaborate party affair. Pleace each piece of silver so that the end is one inch from edge of table. Let each piece be absolutely parallel with each other. Place the silver in the order which it is used, beginning at the outside and using towards the place. Either the salad or dessert silver may be brought in on the plate or placed from the right. The knives are placed at the right of the plate with cutting edge towards the plate. Place spoons with bowls up, at the right. The forks, with tines turned up, at the left of the plate. Place the napkin bat and squarely folded, at the left of the fork. The hem and selvage of the napkin should be parallel with the fork and the edge of the table. (There is just one case where the fork is placed at the right and that it when oysters are served, the oyster fork is placed at the extreme right, because it is the first piece of silver used.) Place the water glass at the point of the knife, the bread and butter plate a little to the left of the fork.

Some Suggestions About Serving

It is an excellent thing for children to learn to wait upon the table, and to do it well. This lesson not only makes them useful, but teaches them to be more unselfish and more considerate of others. In serving a meal the chief thought to keep in mind is simplicity and comfort, rather than display and effort.

General Rules.—Pass food from left to right, this leaves the right hand of the person free to help herself. Be careful in passing food, to lower dish within easy reach. Remove and place food from the right.

Place folded napkin under all dishes containing food to be served, that is all dishes that are placed on the hand and passed.

In clearing the table for another course, remove all dishes containing food, that is first the platter, next the soiled plates, and last of all the clean china or silver that were not used, also anything pertaining to the course that will not be needed in any other course. Salted nuts, bonbons, and all water and wine glasses remain upon the table until the end of the meal.

Order of Serving

The order of serving depends largely upon the wishes of the hostess and the occasion.

Serve first the hostess or the guest of honor, then the next person to the right, in succession around the table, whether man or woman. The advantage of serving the hostess first is to see if the dish has been properly prepared and provided with suitable serving silver. Also, if the course is unusual or puzzling, the guest, by observing the hostess, may learn how to serve himself.

There are three forms of service, the English, the Russian, and the Mixed or Compromise. The last as its name indicates, is a compromise between the other two.

The English service is the most practical where help in table service is limited, as all the food belonging to one course is placed in suitable dishes before the host, hostess, or some other member of the family, and served from the table.

The Russian service is from the side and is in use for formal dinners and luncheons. It is in use also for all meals by those who care for form and have the servants to conduct it well. The plates are placed empty, for the successive courses, and all the food is passed attractively arranged on suitable dishes, from which each person helps himself. Or the food may be arranged on individual plates and placed before each person, although this is not the best form of service.

The combination of the two forms results in the Mixed service in which some of the courses are placed upon the table in the English way, while others are served from the side Russian style. For example the soup may be placed (Russian), the meat carved at the table by the host (English), the vegetables passed by the waitress (Russian), the salad served by the host (English), or passed by the waitress (Russian), and the dessert served by the host (English).

Laying the Table and Serving a Home Dinner Without a Maid

One can serve meals, without a waitress, in an ordinary and attractive way. Lay the silence and table cloth, a plate for each person, then the silver according to preceeding directions. In convenient places towards the corners, place a plate of butter and relishes. The carving cloth and set should be in place

Special care should be taken in laying the table to provide everything necessary, that there may be as little occasion as possible to go to the pantry or serving table. Since the soup tureen is rarely used, the soup is brought from the kitchen hot, in heated soup plates, by some younger member of the family. As already mentioned, children should be allowed

Says She Suffered For Many Years

THEN DODD'S KIDNEY PILLS CURED HER KIDNEY TROUBLES

Mrs. Felix Ascah Found No Relief in Doctors or Hospital Treatment, but Dodd's Kidney Pills Brought a Speedy Cure.

Haldimand, Gaspe Co., Que.—Apr. 20th (Special.—Mrs. Felix Ascah is telling her numerous friends here that her complete recovery from kidney disease from which she suffered for years is due to the splendid work of Dodd's Kidney Pills.

"My trouble started from a strain," Mrs. Ascah says. "I suffered for years. I was attended by a doctor and was also treated at a hospital. I suffered from stiffness in the joints, I had a bitter taste, especially in the morning, and at times was subject to severe headaches. I had a pressure and often a sharp pain at the top of my head and my skin itched and burned at night.

"Neither from the doctor nor at the hospital did I get any permanent relief. Then I started to use Dodd's Kidney Pills and two boxes did me so much good I feel like recommending them to everyone who has kidney trouble."

Dodd's Kidney Pills cure sick kidneys. Cured kidneys strain all the impurities, all the seeds of disease, out of the blood. That makes good health all over the body. That's why those cured are so enthusiastic in regard to Dodd's Kidney Pills.

HUSBAND OBJECTS TO OPERATION

Wife Cured by Lydia E. Pinkham's Vegetable Compound

Des Moines, Iowa.—"Four years ago I was very sick and my life was nearly spent. The doctors stated that I would never get well without an operation and that without it I would not live one year. My husband objected to any operation and got me some of Lydia E. Pinkham's Vegetable Compound. I took it and commenced to get better and am now well, am stout and able to do my own housework. I can recommend the Vegetable Compound to any woman who is sick and run down as a wonderful strength and health restorer. My husband says I would have been in my grave ere this if it had not been for your Vegetable Compound."—Mrs. BLANCHE JEFFERSON, 703 Lyon St., Des Moines, Iowa.

Before submitting to a surgical operation it is wise to try to build up the female system and cure its derangements with Lydia E. Pinkham's Vegetable Compound; it has saved many women from surgical operations.

Write to the Lydia E. Pinkham Medicine Co., Lynn, Mass., for advice—it will be confidential.

Make your FENCEPOSTS ROT-PROOF

DID you know that the ordinarily good fence post which you are accustomed to replacing every four or five years could be made to last 20 years? Creosote treatment does it. And Grade-One Liquid Creosote Oil brings this advantage right to your door because it is creosote in such form that the average home owner and farmer can use it.

Barrett's Grade One LIQUID Creosote Oil

The biggest point about Creosote Oil is that you can apply it by brushing or dipping. No cumbersome, closed-cylinder method. Just as simple as painting. And it penetrates deeper than any other preservative. Stop those costly renewals. Use this wonderful preservative on all wood work exposed to earth or dampness.

Carritte-Paterson Mfg. Co., Limited
Halifax, N. S. St. John, N. B. Sydney, N. S.

and taught to help in the serving, even the boys, should have a daily share in such duties as filling the water glasses, passing butter and sauces and removing the dishes between courses.

It is a help to have someone who sits near the carver serve the vegetables that are to be on the same plate with the meat, as passing the plate back and forth is avoided. Great care should be taken to pass all the accompaniments to the courses, as butter and syrup with hot cakes, cream and sugar with cereals, and relishes when needed. Avoid however, the confusion of passing too many things at once. It is not practical to carry out for this kind of service, all the rules observed by a waitress. For instance, it is too much to expect one who has to prepare and serve a meal to take additional steps solely for the sake of form. Therefore, for this kind of serving it is allowable to leave a person with a plate, and to remove two plates at a time, one in each hand.

Suppose the menu to be,—

Cream of Pea Soop Croutons
Roast Lamb Brown Grævy
Whipped Potatoes Tomatoes
Mint Jelly
Bread
Apple Pie Coffee.

The order of service would be as follows,—

1. Place soup plates and pass croutons, remove soup plates two at a time. (Remove with right hand).
2. Bring to the table as many warmed plates as there are people at the table, and place before host.
3. Bring in meat platter and place before host.
4. Bring in dishes of vegetables and gravy and arrange in order parallel with edge of table and if possible directly in front of the persons who are to serve.
5. Clear table according to general directions, except, to save steps remove two plates at a time.
6. The table cleared and crumbs removed, bring in plates for dessert and place before host, bring serving silver and then dessert.
7. Bring coffee service, placing coffee pot at right of hostess, the sugar and cream in front of hostess and the cups at the left. As each one is served with dessert, pass coffee.

The successful dinner depends upon quality rather than quantity; it depends so much upon the good fellowship which attends the meal. In general let the meal be a rest time where cleanliness, good taste, good simple food, harmony and good manners prevail.

BEFORE HOUSECLEANING

Devote a few minutes at the beginning of housecleaning to sew stout straps of tape or canvas to the sides of the mattresses. Nothing is more conducive to weariness than tugging at a heavy mattress on which one cannot get a good finger-hold. Make the straps long enough to admit the hand readily, pin them flat along the sides of the mattresses and sew the ends securely.

Some mattresses have these straps attached when purchased. If they have not, by all means add them because of the ease with which they can then be handled.

If you have some tender old curtains which are likely to tear in washing, fold them evenly several times and baste loosely with white thread. Wash and rinse carefully, remove the bastings only when the curtain is ready for the curtain stretchers. When the curtains ars wet they are much heavier and it is lifting this weight by a single thickness of the material that tears them.

A New Shoe Idea for summer outdoor work

IDEAS FOR HOME COMFORT

Many of us, no doubt, have a vague sort of notion at times, that our homes are not quite so nice and neat as we should like; but somehow, we hardly know what to do to improve their appearance, and "Oh, I can't be bothered anyhow," we say.

Wait a minute, please. Will the improved appearance of the house and the "alone I did it" sort of feeling that will come over you, really not be worth the trouble? Perhaps you cannot afford to spend much on improvements, but if you will remove all rubbish, keep things in repair and the place tidy, you will find that you have already made a big step forward.

A lick of good enamel paint applied to some of the shabby old furniture, brightens it up past belief. Perhaps your wallpaper is getting dirty, or the edges ragged near the floor. Good wallpapers are very inexpensive nowadays. Make your paste thin and with boiling water. Have you ever tried a brown paper skirting board? Cut strips of stout brown paper, six inches wide and the necessary length, and paste them round the walls. When quite dry, give the paper boards two thick coats of dark mission oak staining. This stiffens and strengthens the brown paper immensely and the skirting board gives a nice finish to the room. Here is the staining recipe: 1 lb. burnt umber, 4 ozs. lamp black, 1 pint japan driers, 2 quarts boiled linseed oil.

Of course, the ingredients must be used in proportion when mixing a larger or smaller quantity.

Inside surfaces of doors and window-panes look better treated with this staining than when painted, and cost very much less to do. The old carpet-square will look brighter, too, if the floor-surround be given one or two coats of the staining.

Keeping Out the Mud

How to keep the mud out of the house is a vexing problem for many a housewife. A boot-scraper at each side of the doorstep and a cocoanut fibre mat just inside the door helps some. Then, cheap linoleum on the kitchen floor costs surprisingly little. Do try it. The saving of your back and arms will pay for its value very soon.

A covered cupboard in the entrance hall, for overshoes and rubbers removed on the mat, also for extra boots, gloves, caps, balls of twine and odds and ends of a like nature, takes up very little space and plays quite a part in keeping things trim. Have it made triangular in shape and 40 inches in height, with three shelves. As the two sides fit losely against the two walls and are never seen, the cupboard can be made of any rough lumber. Ours was made from a packing case. Line the inside with brown paper and cover the top with a piece of fairly thick material—art-serge, is as good as anything. Then, either have the cupboard fitted with folding doors of planed boards and stain them dark mission oak, or fit it yourself with curtains of the same material and color as the top cover. A peacock blue, or terra cotta vase, filled with a few fresh flowers, standing on the cupboard top, would give a touch of refinement to the entrance of one's dwelling that is well worth the small amount of trouble entailed.

Talking of room-saving contrivances, a very useful one is a large, deep, strongly-built packing case set on castors. This case, when it stands mouth upwards, should be about as high as a low table. Have a hinged lid put on it, about ½-inch larger on the front and the two sides than the case itself. Then over the lid with a piece of thin oilcloth, or a piece of sheet tin would do. Tack a piece of cretonne round the sides, or these

TO-DAY AND EVERYDAY

Now a
Fine, Bonny Little Boy

Penetang (Ontario) Child, Once so Thin and Delicate, Cured by Dr. Cassell's Tablets.

MRS. JARVIS, BOX 286, PENETANG, P.O., ONTARIO, says: "It is a pleasure to write and tell you what Dr. Cassell's Tablets have done for my baby. When only five months old he was taken ill. I had medical advice for him, and was told he had colic, for which he was treated, but he did not get any better, only worse. I tried several special foods, but none of them would stay on his stomach, and he became so thin that he seemed just skin and bone. He only weighed ten pounds. We never thought poor baby could live, but one day I chanced to hear of a baby's case almost like mine, that had been cured by Dr. Cassell's Tablets, so I got some for my baby, and I am thankful I did. After a few doses the nervous jumps he had suffered from stopped, and soon he was almost well. I have given him the Tablets during teething, and find them very soothing. He is a bonny boy now, quite cured, and weighs twenty-five pounds at twelve months old."

Baby Jarvis.

Every mother should know that Dr. Cassell's Tablets are just as suitable for children as they are for grown-up people. Their splendid nutritive and vitalising properties soon overcome any tendency to nervousness or weakness in the little ones, and lay the foundation of a strong constitution for after years.

Specially valuable for nursing mothers and during the Critical Periods of life.

Sold by Druggists and Storekeepers throughout Canada. Prices: One tube, 50 cents; six tubes for the price of five. War tax, 2 cents per tube extra.

Sole Proprietors: Dr. Cassell's Co., Ltd., Manchester, Eng.

THIS WASHER MUST PAY FOR ITSELF

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right, but pay me first, and I'll give you back your money if the horse isn't alright."

Well, I didn't like that. I was afraid the horse wasn't "alright" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

Our "Gravity" design gives greatest convenience, as well as ease of operation with quick and thorough work. Do not overlook the detachable tub feature.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see, I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, *before they pay for them*, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six minutes. I know no other machine ever invented can do that without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight, too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that on washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50c a week till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes . . six minutes.

State whatever you prefer a washer to operate by Hand-Engine Power-Water or Electric Motor. Our "1900" is very complete and cannot be fully described in a single booklet.

Address me personally, S. G., Morris, Mgr., Nineteen Hundred Washer Co., 357 Yonge St., Toronto, Ont. (Factory: 79-81 Portland St., Toronto.)

could be painted, if preferred, and if smooth enough, so as to cover up the trade announcements, usually stamped on such cases, as for instance, "Jelks Prime Tomatoes" and such like. The case could stand in a corner of the kitchen, where the top would serve admirably as a wash-up table, wash-hand stand, chopping table, or any such purpose; while inside it could be stored rugs, comforters, spare blankets, towels, wraps and anything like that, that are not constantly in use.

The placing of the little castors under the four corners should by no means be omitted, as these will make all the difference to the usefulness of the case. Remember, rugs, blankets and things of that kind will soon make the case very heavy; but it can be moved about quite easily if on the castors.—T. R.

Year of Years to Plant Potatoes Let the Aspinwall Do the Work

The *only* correct drop. *A one-man, Automatic Potato Planter.* Saves expense of extra man. Does *all* the work—*all* the time. Plants *more acres* per day—opens the furrow, drops the seed, any size, any distance, marks the next row—all in *one operation.* 65,000 now in use. Plant the *Aspinwall way.*

Aspinwall No. 3 Potato Planter

Corn, pea, bean, and fertilizer attachments furnished when wanted.

WHY SHINGLES DO NOT LAST LONGER

Why do not shingles last as they used to? The reason given by builders for the shorter life of the modern shingle is the severe draining process by which the standing timber is bled of its sap for modern commercial uses, and the process of steam drying instead of natural seasoning, once the only method of preparation. Then the modern shingle is sawed, exposing the grain to the weather, whereas the olden-time, hand-riven shingle presented the less susceptible part of the wood fibers to the weather. The old hand-riven shingles were very long and very thick which, of course, meant greater durability. But the great secret of their long life was that the wood fibers were merely separated or split, the surface of the fibers remaining intact.

For re-roofing farm buildings, one should use the best shingles he can get.

When shingling, begin at the lower edge of the roof working upward toward the peak and chalk line the line of the lower edge of each upper course of shingles upon the lower couse to help in laying them straight. Or lay the lowest course part way and then work upward along the left edge of the roof baring only a small patch of roof at a time.

Use the very best nails, for they are poor enough. The peak of the roof requires a binder of shingles close lapped and laid regularly along it at right angles to the others. Such a binder will make an old roof last much longer. M. R. C.

Cream to whip well should contain at least 25 per cent of fat. The cream should be cold, not over 40 degrees F. to whip well. Adding a little sugar sometimes improves the whipping qualities of cream. The cream should be aged at least 24 hours before whipping.

How to Order Patterns.

Order by number, giving age or measurement as required, and allowing at least ten days to receive pattern. Also state in which issue pattern appeared. If two numbers appear for the one suit, one for coat, the other for skirt, thirty cents must be sent. Address Fashion Department, "The Maritime Farmer, Sussex, N. B. Be sure to sign your name when ordering patterns. Many forget to do this.

Positively no patterns will be sold under 15 cents each, owing to advance in cost of same.

When ordering, please use this form:—

Send the following pattern to:

Name .....

Post Office.....

County .....

Province .....

Number of Pattern.....

Age (if child or misses' pattern).....

Measurement—Waist .....Bust.....

Date of issue in which pattern appeared. .....

PEDLARS "OSHAWA" SHINGLES
DON'T think your home will always be spared the danger of destructive flames. Lightning and the straying spark show no favors to fine buildings and love-shielding homes. Unless your roof is of inflammable material, at any moment lightning or fire may envelop all you possess and endanger the lives of those the heart holds nearest.
Fulfill the duty of guardianship the home folks have placed in you by seeing to it at once your loved ones, your property, are fully protected from the ever-present menace of fire.
Pedlar's "Oshawa" Shingles mean safety and protection in the most practical, most dependable form. Made of sheet metal, each shingle interlocks on ALL FOUR SIDES, forming a single sheet of steel that is practically indestructible. Retain their beauty and service without repairs as long as your home lasts. Write for "The Right Roof" Booklet M F

EGGS SENT BY EXPRESS FROM SUSSEX TO VANCOUVER, 23 CHICKENS HATCHED FROM 26 EGGS

Seventeen years ago I promised a young lady, who had come from England with her parents and who was very successful with her poultry, a Plymouth Rock cockerel, but as she and her family moved soon after to Vancauver, she hoped I would send her the eggs instead. In April of 1900, I packed 26 eggs in a tin box in buckwheat hulls mixed with wheat bran, and shipped them by Express. The hardest part was to get them safely to Sussex over the very rough, frozen roads. It was so hard that my daughter said: "I thought father had more sense."

They arrived safely and 23 of the 26 eggs hatched, and 20 lived; speaking well for the care given by the young lady, also well for the Express Company that transported them such a long distance. JOHN H. KING. Kingsbrook Farm, Sussex.

The substanes in blood are largely of an albuminous nature, and their removal from fabrics that are difficult to launder may be effected by methods which make use of the properties of albumins. One method is to soak the fabric in lukewarm water until the stained part is softened, then place a little pepsin on the stain. The albuminous part of the blood is by this means digested so that it can be readily washed out or mopped up. Another method that is recommended is to use strong ammonia water, allowing the fabric to remain in this until the stain can be rubbed or washed out.—C. E. Vail.

LADY'S BUNGALOW APRON.

By Anabel Worthington.

The tidy housekeeper of moderate means is always interested in herself and in her home to such degree that she aims to look her best, even when working, and she does not consider an apron a thing apart, but something necessary to the complete furnishing of her wardrobe. The favorite style is the bungalow apron and the one pictured is sure to interest all who see it.

The garment hangs straight from the shoulder—just like the one piece dress of fashion's acceptance. The upper part fits to the figure with neatness and the fulness below is drawn to the back and held there with tie strings. The pocket in each front is a convenience made attractive with banding in contrasting color; the square neck is finished with banding also and the kimono sleeve has a cuff facing to correspond.

Among the pretty wash materials for developing the design are plain or striped percale, lawn, chambray, gingham, &c; for studio work, linen, sateen and the like may be considered appropriate. You could not be better occupied for one hour than you will be in making this garment.

The apron pattern No. 8,161 cuts in sizes 36, 40 and 44. To make in size 36 requires 5 yards 36 inch material and ⅝ yard 36 inch contrasting goods to trim.

To obtain the pattern send to the office of this publication.

SANDWICHES FOR THE LUNCH BASKET

The call of the school bell demands suitable food for the children's dinner baskets, and sandwiches are almost "must-haves." Bread a day old is ideal, but a sharp knife to cut it into thin slices, and something to put between, are the absolute essentials. Oiled paper such as comes around package crakers and cakes, or the regular paraffin paper which is sold for the purpose, should be wrapped around each sandwich to keep it moist. There are a number of sandwich fillings which may be prepared at leisure and stored in small glass cans or jelly tumblers on the cool cellar shelves. Some of these will keep for weeks in a cool, dry place.

Sweet Peanut Filling.—To one-half cup of finely ground peanuts add one cup of grated maple sugar, or light brown sugar, and work in sufficient fresh butter to make a stiff paste. When ready to spread on the bread, moisten with a spoonful of sweet cream.

Pounded Cheese.—This will utilize the scraps of left-over cheese which have become too dry or unsightly to serve. Remove the rind and run the pieces through the meat grinder with the fine-toothed attachment, or pound to a paste in a mortar. To a half pound of the cheese add one teaspoonful of pepper. Mix these together thoroughly and work in enough melted butter to make a stiff paste. Store in small jars covered with paraffin. This will keep for weeks. It is fine to spread between sandwiches which are to be toasted over a camp fire.

Fruit Filling.—Make a paste of chopped nuts, dates, and prunes or figs. This will keep for weeks in a cool place if stored in tightly covered jars. Any rich jam or marmalade is fine to spread between slices of brown bread.

Fig Filling.—One-half pound of finely chopped figs, one-third cup of sugar, one-half cup of boiling water and two tablespoonfuls of lemon juice. Mix and cook in a double boiler until thick enough to spread. Can and seal while hot if it is desired to keep it for several weeks.

Sandwiches without Bread.—These are prime favorites with the children. We use them also when we receive a telephone call to jump into the auto and go to an impromtu picnic, if there is no fresh bread in the house. Make baking powder biscuits a little larger than usual. Chop fine any cold chicken, veal, or other cold meat, or canned sardines or salmon, season it highly with salt, pepper, and celery salt if it is liked. Add enough sweet cream to make a stiff paste, cut the tops from the biscuits, take out some of the inside and replace the crumbs with the meat paste. These are extra good when impaled on a sharp stick and toasted in the school stove.

WATER AND FRESH AIR VS. HEALTH

"An apple a day keeps the doctor away." And the doctors tell us that plenty of water will accomplish the same end, and water is cheaper and easier to get than apples. Because of its very cheapness we underestimate the value of water to keep our bodies in proper shape. Most of us look carefully to the cleansing of our outer bodies and then neglect to see that our inner bodies are given the same treatment. Physicians say that every individual should drink six to eight glasses of water each day, one upon rising, two or three between breakfast and dinner, two or three between dinner and supper and one upon retiring. That sounds easy enough and yet it is a fact that very few of us drink as much as this. The rule is always to drink before and after meals and not with them. Drink often of good, pure water, not a sup but a glassful.

And even cheaper and easier to get is fresh air. Day and night it should circulate through your homes, through the living rooms and the sleeping rooms, bringing with it health and vigor. Moreover, contrary to a very generally accepted notion that night air is not good for one, it is the very purest air we breathe. Actual tests have proved again and again that the bacteria count in the night air is much lower than in the air during daylight, when the activities of the world are

Hysteria

ABOUT the first thing the victim of nervous collapse does is to cry. With ebbing nerve force all control is lost, and in this helpless, hopeless condition confidence disappears and discouragement takes its place.

Because sufferers from nervous disorders are often strong and healthy in outward appearance they frequently get little sympathy from their friends or from doctors who do not understand nervous diseases.

If there is ever a time when sympathy is needed it is when the nerves give way. But you must have more than sympathy if you are to recover your nervous energy. The feeble, exhausted nerve cells must be nourished back to health by the use of such treatment as Dr. Chase's Nerve Food.

This food cure is so gentle and natural in action that it admirably suits the delicate condition of the exhausted nervous system, and at the same time is wonderfully potent in restoring vigor and strength.

A little patience is necessary in order to build up the nervous system, so far run down, but as headaches disappear, digestion improves, and you rest and sleep better you will be encouraged to continue this food cure until restoration is complete.

50 cents a box, 6 for $2.50, all dealers, or Edmanson, Bates & Co., Ltd., Toronto.

Do not be talked into accepting a substitute. Imitations disappoint.

at full height and the maximum of dirt and dust is active. Yet, in spite of this demonstrated scientific fact, thousands and thousands of people shut up their sleeping rooms during the winter for fear of letting in the "cold, damp, night air." In the summer, of course, windows are opened to let in the cooling breezes, but during the winter months the purifying fresh air is diligently shut out, and thousands sleep in closed-window rooms and breathe over and over the vitiated air, rendered disease-breeding by the waste of their own bodies.

A cup of hot water taken the first thing in the morning rinses out the stomach and prepares it for a day's work. Sipped as hot as can be borne it is excellent for indigestion.

THRIFT AIDS HEALTH

By H. Addington Bruce.

There are many familiar arguments to reinforce the gospel of thrift. But there is one argument which has not been advanced with anything like the frequency it deserves. This argument is found in the fact that when a man begins to save money he is pretty sure to begin to improve in health.

And the reason is not far to seek. Not only do thriftless men waste their money, but commonly they waste it in ways that are injurious to them.

In thousands of instances they waste money in alcoholic dissipation, to the great injury of their physical organism. In thousands of other instances, even when the wasters do not spend a cent for liquor, they throw away their money in extravagant expenditures for food that is both too abundant and too rich.

The ultimate result is self-poisoning, just as surely as the ultimate result of persistent indulgence in intoxicants si self-poisoning.

Other wasters, temperate as to food and drink, spend lavishly for amusements that involve nervous stress and often involve long hours in unhygienic surroundings.

Night after night they "sit in" at card games or keep the dust from gathering on top of a pool table. Or, perhaps, they have a mania for the dance hall or are threatre habitues.

This sort of thing, done nightly, means a great waste of money. It also means a constant drain on nervous energy, to say nothing of the harm done by long-continued breathing of air that is more or less stale.

Then there are wasters who toss money carelessly to hack-drivers and taxicab chauffeurs. Riding, of course, is easier than walking, and occasional indulgence in hacks or taxicabs is not a vice.

But to make it the habitual thing means money waste, and may mean the creation of a non-exercise habit that is disastrous to the physical health.

Once trrift is begun, expenditure of the kinds mentioned are necessarily cut down. They are the things one can most readily afford to do without, as wasters who turn thrifty perceive at once. And as soon as wasting along these lines is eliminated, better health is bound to be the result.

There is another important respect in which habits of thrift bear directly and favorably on health. The mere consciousness that one is saving money is of health-improving potency.

It gives a mental tranquility unknown in the days of wastefulness. And mental tranquility of itself acts as a tonic to promote the efficient functioning of every bodily organ.

Of course, thrift should never be carried to the point of stinginess with self or others. The mean, penurious man cannot avoid experiencing mental and physical reactions from which his health suffers as it would suffer if he were a self-indulgent waster.

Instead of being mentally tranquil he will be continually agitated by a dread of parting with any of the money he wishes to hoard. His anxiety will reflect itself in what may fairly be described as miser's dyspepsia.

But, this extreme alone excepted, thrift is assuredly health-making. If for no other reason it ought to be enthusiastically practised.

WHO AM I?

Last leap year I did not want to embarass my best girl to make her propose to me, so asked her to be my wife, and she said, "I would rather be excused," and I, like an idiot, excused her. But I got even with the girl. I married her mother. Then my father married the girl. Now I don't know who I am.

When I married the girl's mother, the girl became my daughter, and when my father married my daughter, he is my son. When my father married my daughter she was my mother. If my father is my son and my daughter is my mother, who in thunder am I? My mother's mother, (which is my wife) must be my grandmother, and I being my grandmother's husband, I am my own grandfather.

CHAMBERLAIN'S TABLETS

THE BEAUTIFYING OF THE HOME GROUNDS

(Continued from page 393)

two or three inches of soil loose to form a mulch.

Roses should be cut back severely when first set out, if planting is done in the spring, from a half to two-thirds of the wood being cut away. It is well to observe the condition of the dormant buds when pruning and leave for the terminal bud a good stout unbruised one.

The following list of varieties can be very strongly recommended, as being perfectly hardy and they will, if properly planted and given a reasonable amount of care, produce blooms more or less throughout the summer.

I have made but a small selection and if any one here would like a larger list, I shall be pleased to make a further selection.

Capt. Hayward, bright scarlet crimson; perfectly formed flower and delightfully fragrant.

Fisher Holmes. Glowing scarlet crimson, and claimed by some to be an improvement on General Jacqueminot. Blooms very freely.

Frau Karl Druschki. No other rose has created such a sensation among rosarions. It is the best pure white H. P. A charming rose in every way.

George Arends., might well be called the pink Druschki. The blooms are of large size and well shaped.

Mrs. John Laing was introduced as far back as 1887 and still retains its place in the front rank; colour soft pink.

Ulrich Brunner. Flowers of great size and substance; colour bright cherry red.

The foregoing are all Hybrid perpetuals. The Teas and Hybrid Teas are not as hardy as the Hybrid Perpetuals, so I have not included them in this paper.

In conclusion I wish to thank you for the opportunity of giving this paper and regret that I was unable to give it the amount of preparation which the subject deserves. If at any time I can be of service to you in making a selection of shrubs, I shall be glad to do so and assist you in any way I can.

PRODUCE MORE POULTRY PRODUCTS

(Continued from page 401)

will be between two and three days after hatching. They should then be fed a little at a time and often—say **five times daily.**

First feed, bread crumbs moistened with milk, just what the chicks will clean up on a little clean sand or chick grit; second, finely cracked mixed grain; third, rolled oats; fourth, moistened bread crumbs; fifth, finely cracked mixed grains. If too early to get the chicks on grass, green feed is supplied in the form of young lettuce, sprouted grains, or any other tender succulent feed that is acceptable. After the chicks are ten days to two weeks old, coarser feeds are allowed. All changes are made gradually. The infertile eggs are boiled with mash feed and the bread and milk discontinued. Hoppers in which are placed grains and dry mash or rolled oats should be put where they can have free access to them. As soon as they become accustomed to the hoppers the hand feeding is reduced to the mash feeds, and if the chicks are on good range it will be found that after a time they will get careless about coming when called. The mash may then be dropped, and dependence placed entirely on the hopped feeding. Place grit, water and, if possible, a dish of sour milk where the chicks will have free access to it.

The mash may consist of equal parts bran, middlings, and cornmeal, and half part beef scrap, but the composition is more or less dependent on the feeds that are most available.

Layers

Grit, oyster shell, charcoal, and dry mash are kept in hoppers constantly before the flock. Fresh water and when possible a dish of sour milk, is also supplied. In the morning a light feed and in the eveniny a full feed of mixed brain is given in the litter; at noon, green feed, and if desired a feed of moist mash. When sour milk is not available, green cut bone may be fed alternately with the moist mash, or coarse beef scrap may be supplied in the hoppers.

The mash mixture is equal parts corn, bran, and middlings, half part gluten and half part blood flour or beef scrap. For old hens, either bran is used in place of the regular mash or the hopper is kept closed except at certain times of the day.—By F. E. Elford, Dominion Poultry Husbandman, and George Robertson, Assistant.

Seize this Export Market Opportunity

In 1916, Great Britain Imported 66,064,110 dozen eggs

TO that total Canada contributed 14,317,780 dozen—of which 7,363,290 dozen were United States eggs. Therefore Canada's net contribution was only 6,954,490 dozen domestic eggs.

CANADA'S eggs are of First Class quality and hold a high reputation in the British market.

THE present is a most opportune time to secure a permanent share of this trade.

TO do so, we should increase the output by at least 10 MILLION DOZEN.

THIS means 15 more hens on every farm in Canada.

Set more eggs—Raise more chicks—Act now —This is National Service.

Ask for Poultry Bulletin of Information Bureau

DOMINION DEPARTMENT OF AGRICULTURE, OTTAWA.

HON MARTIN BURRELL, *Minister.*

A FAMINE OF TURNIP AND OTHER ROOT CROPS EXPECTED IN 1918.

Editor the Maritime Farmer:

It is of vital importance that the farmers grow their own turnip seed this year. In the fall of 1914 the Seed Branch of the Department of Agriculture, Ottawa, fearing a shortage in supply of field roots and garden vegetable seeds owing to disturbed conditions in European countries, which before the war were the source of supply for such seed, put forth an effort to induce the farmers of the Dominion to grow their own seed. While this effort was only partially successful we have not to date met with any serious shortage. The principal reason for this was the large stock of old seed held in reserve, and many root fields in the Maritime Provinces last year showed the effect of the use of old seed. For the coming spring season conditions would seem to indicate that there is about enough of small garden vegetable seeds of rather low vitality which will necessitate heavier seeding, and a slight shortage of Swede turnip seed. As this is the principal field root crop for the Maritime Provinces and our farmers will agree with me that we cannot afford to reduce the acreage of our root crops, is it not about time we began to consider ways and means of procuring seed for our 1918 crop? It is almost a certainty that areas formerly used for the production of field root seed in countries such as France and the British Isles will next season be used for production of food for home consumption and the exportation of seed prohibited. In view of this the only thing left for us is home production. While no doubt the few who are already growing Swede turnip seed for sale in this district will increase their area as much as possible there is no possibility of their producing enough seed for the 25,000

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

A MESSAGE TO WOMEN!!

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:

Mrs. M. Summers, Box 309 Windsor, Ont.

acres annually grown in the Maritime Provinces. In the face of this the only solution of the problem is for every farmer who is raising turnips to grow his own seed. Any farmer who has a bushel or two of medium sized, fairly well shaped turnips, can with a little care grow as good seed as he can buy at any time. The proper way is making a selection in the fall, leaving all the roots and about four inches of the top attached to the plant. But even with the tops cut close to the bulb and the roots trimmed off you can produce seed. The centre or crown growth will be destroyed but the lateral shoots will come up and produce good seed. These stalks are weaker and weaker and you have more trouble to prevent breaking down before ripening. Select about four good turnips or plants for every pound of seed you wish to produce, choose a piece of dry or well drained soil fairly rich (corner of an old garden is a very good place) cultivate well, plant in rows three feet apart and about eighteen inches apart in the row. If you are putting out thirty plants put them in three rows of ten each or if you have only a dozen, three rows of four each. The reason for this is, that the plants in this way support one another and ripen more evenly. The turnips should be set in the ground deep enough so that the top or crown will be covered by about a half inch of earth. Keep clear of weeds till the plants are about eighteen inches high, after that they should cover the ground and take care of themselves. About the time they are going out of bloom stakes should be driven in and something like binder twine or wire, put around them about 2½ feet from the ground to prevent them from breaking down while ripening. They are fit to cut as soon as the pods turn a light brown. Mangles, beets, parsnips and carrot seed may be produced in the same way. This means of preventing a seed famine in 1918, is open to every farm who has some good sound roots or vegetables in his cellar at the present time. One farmer in 1915, who had never attempted the work before, produced 125 lbs. of extra good Swede seed on one-eighth of an acre and there is no reason why any farmer cannot obtain like results.

S. J. MOORE,
Maritime Representative of the
Seed Branch, Ottawa.

HOME GROWN SEED

Editor the Maritime Farmer:—

An effort is being made this season by the Department of Agriculture to bring to the notice of farmers generally, the necessity of the home-growing of farm seeds.

The shortage of the supply of imported seeds must be made up at home. This applies especially to field-roots and vegetable seeds. We must rely upon home production for war conditions have interfered with usual sources of supply.

Farmers are recommended to try the growing of turnip seed from such smooth, sound roots as they have available, even though the neck portion is short; these will send out seed bearing shoots.

The roots should be planted deeply, the neck covered with about one-half inch of soil, in clumps 30"x30" apart, upon rich, dry, sheltered soil, as early as possible.

The attention of Agricultural Societies is called to the possibilities in securing seed from the clover crop (Red and Alsike). The Clover Thresher, which did excellent work in Carleton County last year, is again available on the same terms to communities.

Community ooperation is recommended for the production and marketing of the highest yielding and best selling varieties of crops. Too many varieties on sale in a community is a deterrent to the receiving of top prices.

The Seed Centre idea is a further development of this plan and may be extended to the production and selling of seed stock of potatoes, grains, clover seed, turnip seed, etc.

Soils and Crops Division,
Fredericton, N. B.

EXTERMINATING COUCH GRASS.

When the land for the Experimental Station now located at Morden, Man., was purchased in 1915, it was found to be badly infested with couch grass (also called quack, twitch or quick, grass).

In an effort to exterminate this week, sixty-five acres of that part of the farm which appeared to be the worst infested was treated as follows:

About the first of June, it was ploughed four inches deep and well harrowed. The spring tooth cultivator was then used, serving to draw the roots well to the top of the ground. Next a chain harrow was employed. This implement brought all the loose grass to the surface and left it in large rolls all over the field. These rolls were then forked into heaps to dry and were burned about August 1st.

Immediately after this the land was again ploughed and again given the treatment outloned above, and was finally ploughed a third time late in the fall.

In the spring of 1916, it was well harrowed then sown and cross-sown with barley at the rate of 1½ bushels per acre each way. There was a good crop of grain and it was almost impossible to find a blade of couch grass on the whole area.

GETTING RID OF WILD OATS

Wild oats are recognized as pernicious weeds in all sections where grain is extensively grown. There are several methods of accomplishing their eradication. In any method the first step should be to sow clean seed. In fields which are already infested the grain crop should be followed by one or more crops requiring cultivation. If this cannot be done, then winter crops should be grown as much as possible, as harvesting will take place before the wild oats are mature. In a rotation which has one or two cultivated crops, wild oats will be kept under control.—J. D. Marshall.

A "tip" in growing onions that is well worth heeding is to apply a light coat of well-rotted manure on the surface of the onion bed or row after planting. This stimulates a growth of bulb at the surface of the ground and prevents long necks on the bulbs.

W. C. T. U. BUILDING, TORONTO.

MARTIN-SENOUR PAINT & VARNISHES

HAVELOCK COURT APARTMENTS, TORONTO.

If You Build Well, Paint Well.

YOU have got to paint your home, in order to insure it against the weather. Paint resists the destructive action of sun, wind, rain and snow. Of course the better you paint, the longer you are protected.

MARTIN-SENOUR

"100% PURE" PAINT

(Made in Canada)

is the greatest known protector of wood against weather because it is guaranteed to be made only of pure White Lead, pure Zinc Oxide and Pure Linseed Oil.

You insure your home against fire—perhaps against lightning and burglary. Insure it against wear and weather by painting it with "100% Pure" Paint—the cheapest because it covers more surface per gallon and lasts years longer.

If you are painting this spring, write for a copy of "Town and Country Homes" and "Harmony In Neu-Tone"—our books on home decorating. Mailed free—of course. 103

BUYING AND SELLING CO-OPERATIVELY

(Continued from page 387)

tion, without money and without price, for all clubs of Maritime Farmer subscribers, who wish to save money by co-operative buying. After the cotton seed meal purchasing has been firmly established, other lines may be added by the same clubs on which equally large savings may be effected.

Nor will this plan in any way affect dealers in cotton seed meal. We have a proposition for them that will save money for them and enable them to purchase their requirement at such low prices, that they can offer the goods for re sale at hitherto impossible prices.

The Maritime Farmer will be pleased to hear from farmers who would like to take up the cotton seed meal proposition in their vicinity, and if they can arrange for meetings, we will send one of our representatives to make arrangements with them.

As it takes some time to get the work organized and running smoothly, it would be well for interested parties to write us right away, so that advantage may be taken of what may possibly be the lowest prices of the season. Dealers and farmers clubs that now purchase in small lots, will profit by the saving made by buying in large quantities, instead of in small lots, as is now the custom in Nova Scotia, New Brunswick and Prince Edward Island.

The Maritime Farmer' s plan is worthy of your sincerest consideration, and will be Maritime in scope. Let us hear about your cotton seed meal and oil cake requirements as early as possible.

The co-operative purchase of fertilizers in New Brunswick, has been tried and proved to the satisfaction of all concerned. The plan outlined in this article is along identical lines, but goes a step further by being interprovincial in scope.

GIVE THE HORSE A NEW SPRING COAT

(Continued from page 399)

as the appearance is to be of the best. This is the care which race horses receive and accounts in part for their fine appearance. However, such measures are not generally practical on most farms and with most farm horses. Help is too scarce and every one is too busy, but the next best thing can be done and more quickly, namely using a cover, placing the horse in a comfortable stall and away from drafts. When the horse is thoroughly dry a good rubbing will remove the dried perspiration, free the matted hair and take away the dust and dirt.

The use of covers in the stable is open to discussion, and may depend upon the stable. When it is necessary to work horses in rain or snow it is well to cover with a water-proof cover in order to keep the skin dry and warm.—Melvin Ryder.

A week or two ago, we made a flying trip around the Oxford Jct., Truro, Stellarton, Pictou and Shore Line loop. We spent one forenoon at the College Farm, where we found the various members of the staff busily engaged in completing the details of the work planned for the coming busy season. The butter makers' course had just been completed and satisfactory results in attendance and practical work were reported. This augurs well for better and more uniform quality in the output of the creameries of the Maritime Provinces during this and succeeding seasons. The cheese makers' course had just opened with a fair attendance and a prospect of an increase in numbers on the following day. Superintendent MacKay was ably assisted by Messrs. Barr, Robinson, McDougall, Mitchell, Morrow and other prominent dairying experts.

The College herds are looking and doing well. The calf pens contain some exceptionally promising youngsters. Bull calves seem to be a rather good crop this year, and while they will sell at profitable figures when ready for sale as breeders, Prof. True-

DELCO-LIGHT

ELECTRICITY FOR EVERY FARM

$390 Brings You Electric Light

A self-contained, compact, efficient electric plant for $390 to $465! That can be had in the Delco-Light plant—safe, durable, reliable.

A wonderfully simple equipment—a compact sturdy gasoline engine, generator, switchboard and storage batteries. Easy to understand, easy to operate. Children are looking after Delco-Light plants to-day.

You can rely on Delco-Light giving you the utmost services that electricity offers—brilliant, safe, clean electric light, convenient, cheap electric power.

It provides current that will flood with light every room in your house, the barns and sheds, outdoors. No more drudgery or time wasted in cleaning, filling and lighting smoky oil lamps.

It provides power that will do mechanically all the milking, separating, churning, washing, water-pumping, feed-cutting.

Small, compact, sturdy—it starts on the pressing of a lever. Stops automatically when batteries are fully charged. Engine is air-cooled—cannot freeze anywhere.

DOMESTIC ENGINEERING COMPANY
DAYTON, OHIO

Economical Electricity

No complicated details about the Delco-Light plant—no big upkeep costs. Lights the average home for less than five cents a day. Saves hours of time spent on chores and housework because of the better, more convenient light it gives. Allowing only 10c. an hour for labor on your farm it will save you at least $127.40 each year. It earns its way, by saving hours of time and labor.

The Useful Power Stand

A portable, efficient sturdy motor can be had with the Delco-Light. Runs from the nearest light socket. Carry it anywhere—it will drive all your light machinery. Uses up very little current.

FREE ALL ABOUT DELCO-LIGHT

A lot of literature has been prepared about Delco-Light. Send for it. Cost you nothing and will interest you intensely. Shows how farm-life is made easier, more attractive by Delco-Light wonders.

Ewing's Grass and Clover Seed

No. 1 Government Standard

has earned a high reputation for sure germination, sturdy growth and heavy crops.

We buy the seed from the districts which we have found produce the cleanest and best strains. Then we clean and re-clean it until it comes well within the Government Standard in freedom from those noxious weeds that are so easy to introduce to your fields, and so hard to eradicate.

Some of our famous Brands :

Ewing's "Canary" Brand Early Red Clover.
Ewing's "Eagle" Brand Late Mammoth Red Clover.
Ewing's "Best" Brand Alsike Clover.
Ewing's "Sun" Brand Timothy.
Ewing's "Moon" Brand Timothy.

All No. 1 Government Standard.

If your dealer does not handle Ewing's Seeds, write for prices and catalogue to 49
THE WILLIAM EWING CO. LIMITED, *Seed Merchants*, McGill Street, MONTREAL.

man would like to see a change in the programme in favor of a higher percentage of heifer calves. There are some splendid producers in the College Holstein herd, and as the head of the herd is exceptionally well bred from the production standpoint, the heifers from such a mating should soar well up with the top notchers of the breed. The bull calves will be sold to agricultural societies and individual farmers, and there is not a shadow of doubt of the uplifting influence they will exert in the various districts to which they will be taken.

10,543 HAIRS ON A SQUARE INCH OF BEAR SKIN

In the novel Zoological Contest recently advertised throughout Canada by John Hallam, Limited, as to how many hairs were on a square inch of bear' skin, the first prize of $50.00 went to Mrs. Jas. A. Davis, Jr., Box 24, Acme, Alta., who estimated 10,500 hairs.

The following Maritime Province names appear among the prize winners:

5th prize, $10.00, Mrs. J. Frank Roach, Sussex, N. B., 10,777.

8th prize, $10.00, Mr. Chas. T. Duncan, 214 Dominion St., Moncton, N. B., 10,241.

18th prize, $5.00, Jennie A. Parks, Upper Derby, N. B., 11,056.

19th prize, $5.00, Mrs. Jas. McLeod, R. F. D. 5, Mermaid, Lot 48, P. E. I., 10,012.

21st prize, $3.00, Mrs. Clare B. Soucie, St. Anne de Madawaska, N. B., 10,000.

27th prize, $3.00, Miss Julia B. Murphy, Newcastle, N. B., 10,000.

29th prize, $3.00, Mrs. Jos. Cormier, Bonsecourt, N. B., 10,000.

40th prize, $1.00, Erle V. Hinton, Doaktown, N. B., 11,568.

54th prize, $1.00, Walter A. Dougan, Hamstead, N. B., 12,992.

60th prize, $1.00, Mrs. Thomas P. Murphy, Exmoor, North Co., N. B., 8,000.

62nd prize, $1.00, Yolande Arseneau, Bonsecourt, N. B., 8,000.

The estimates varied from "no hair" up to "several millions", but the actual number which was on a square inch of bear skin, carefully checked, was 10,543.

THE HERD BULL

Most farmers realize the important part the bull plays in the herd. They admit that "the bull is half the herd," yet many, after paying a high price for a good individual, let him deteriorate through improper care. The care of the sire in service is fully as important as his selection. If a bull is vigorous and healthy it is safe to assume that he will transmit those qualities to his offspring. I consider it of prime importance to keep the bull always strong and healthy, so that his progeny will be vigorous.

A ring should be put in the bull's nose when quite young, and from the first it should be used when handling him in service or feeding. He is more easily controlled and becomes more gentle when he knows who is master. I take no chances with a bull, however gentle he is. The most gentle are very uncertain and should be watched carefully, otherwise the attendant is liable to meet a tragic end. Never aggravate or mistreat a bull; to do so is to invite trouble of the worst kind.

Intelligent feeding is very important. A bull should have grain the year around. Strength rather than fat should be aimed for in feeding. The dairy sire should be fed such feeds as wheat bran, oil or cottonseed meal. Beef sires should be fed more largely on fattening foods, such as corn. If available, silage is ideal in the ration of either type and should, by all means, be used. Clover hay is excellent. The above foods are available upon almost every farm and there is little excuse for so many poorly fed bulls.

Exercise is very essential for the bull's health, and if taught when young he can be made to work, thus adding to his value and health at the same time.

If taught to run a tread power he can be used daily in pumping water, churning, washing, running the fanning mill, and many other ways. If not made to work, the bull should have daily exercise in a strongly fenced field or yard, allowing him to be by himself. Cows should never be allowed to run with him. It is best to keep the bull in a secure stall at night. If he must have a stall in the cow barn never retire without being sure that he is secure for the night.—C. J.

Good-bye to Dull Days

Touring advantages with a Ford car lift farm life out of the rut of hard work. Good-bye to dull days if you have a Ford on the farm. The stay-at-home family craves the pleasures of town life—the jolly parties, the entertainments, the lectures, shopping in town—the change that's better than a rest.

Away, five, ten, fifteen miles in the evening! Back before 10 o'clock, up early and fresh for work next day with a new enthusiasm that livens up everybody. Nothing can take the place of the automobile on the farm for healthy, wholesome, invigorating enjoyment.

Thousands of farmers in Canada use Ford cars with satisfaction. Donald Murray, Kennedy, Sask., says:—"A Ford is a necessity on every farm. I would not be without one as long as I have money to buy one."

But there are other reasons than recreation for adopting the Ford. It takes its place in the day's work. It is your strongest help and time-saver for emergency trips to town. It cuts the cost of running and repairs to the minimum. You can use it profitably and enjoy it constantly. Buy one now.

PREPARING FOR WOOL SALES

The following example will serve to explain the foregoing statements. If a manufacturer can utilize a certain grade of wool at fifty cents a pound clean and he is shown two samples in the grease, similar in every respect except cleanliness, one shrinking, for instance, 50% and the other 25%, he can pay for the former only 25 cents, while he can afford to purchase the latter at a price to the producer of 37½ cents. This alone should show the advantage of preparing a cleanly article.

As a general rule, the long-wooled sheep possess the lightest shrinking wool; the fine-wooled or Merino, the heaviest. The former will yield, under average conditions, from seventy-five to sixty pounds of clean wool fit for manufacture from one hundred pounds of wool in the grease; the latter, from fifty to twenty pounds of the clean product. The greater shrinkage of Merino wool is explained by reason of the fact that it has a much larger yolk content than the coarser types, to which sand and dirt cling more readily.

In order that sheepraisers may gain a more definite knowledge of the character of their wools with respect to shrinkage, the Dominion Live Stock Branch of the Department of Agriculture will make actual scouring tests of uniform samples of wool prepared for market under its direction by Wool Growers' Associations. This information will assist producers in understanding better the grading methods and will enable them to make practical use of the tables which the Live Stock Branch has published in booklet form.

Directions for Preparing and Packing Wool

(1) Shearing should be done on a smooth board floor, never on the dirt, and the fleece should be kept as compact as possible.

(2) Fleeces should be tied with paper twine, never the sisal or ordinary binder twine. Turn in the sides of the fleece with the skin or clipped surface outward. Then fold alternately the neck piece and the tail portion until they meet in the centre of the fleece. This arrangement permits the fleece being readily undone in the mill. Folding and tying may be facilitated by the use of a fleece box, which at the same time gives greater compactness and uniformity to the fleece.

(3) The wool should be packed in very closely woven jute, hemp or paper-lined sacks.

(4) Tags or dung locks should never be included with the fleeces, but always packed separately if the wool is adhering to them.

(5) All black or grey fleeces should be packed by themselves.

(6) Lamb fleeces, possessing unusual quality and length, may well be kept apart from the others and offered for sale as a distinct class.

(7) The wool should be absolutely dry at shearing, and should never, subsequently, be permitted to become wet. Damp wool, in storage, will ultimately assume a yellowish color, which will prohibit its use in the manufacture of white yarn. Besides, mildew may attack it, which will impair the tensil strength of the fibre. Manufacturers greatly dislike and prefer not to purchase wet wool except at a considerable reduction.

(8) Tubwashing should not be practised. If washing is followed at all, let it be done on the sheep's back, and at the time of shearing keep the washed separate from the unwashed. In tubwashing the various qualities of the fleece are so badly mixed as absolutely to prevent sorting, which comprises a separation or division of the fleece into lots containing fibre of reasonably uniform length and fineness. This operation is performed in the mill and each sort may be used for a different purpose in manufacture. Sorting is necessary by reason that a great disparity exists in the qualities of wool growing on different parts of the body. The finest wool is on the shoulder; the coarsest on the thighs; and the shortest on the belly. To serve as a practical illustration, a medium fleece may be roughly differentiated into five classes or sorts; first, back, sides and brisket; second, neck; third, belly; fourth, thighs; and fifth, brokes, or short locks and tags.

Fort William acts as the dividing line for Eastern and Western wools. Domestic refers to wool produced in small lots upon the farm, while Range applies to wool raised upder ranching conditions. "Firsts" represent domestic wool shrinking under 50%; "Seconds", over 50%.

Glossary of Wool Terms.

Black Wool.—Includes all wool either partially or wholly black, brown or grey.

Braid.—A grade name for coarse wool of a lustrous nature.

Britch.—That part of the fleece which is very coarse, produced at the extreme end of the sheep over the thighs.

Brightness.—Wool of light appearance.

Hog Raisers Can Lower The Cost of Pork Production

Big profits cannot be expected from Hogs that cost too much to fatten. Unless a Hog's digestion is good he cannot earn you a penny, as too much high-priced grain passes through its system undigested and is wasted.

Can You Afford to Waste High-priced Grain Feed ?

Remember, it is not what a Hog eats, but what is digested and assimilated, that gives strength, rapid growth or quick fattening.

INTERNATIONAL Stock Food Tonic

used as directed for Hogs gives appetite, pure blood, perfect digestion and assimilation, good health and quick growth. It quickly expels worms and keeps the system in such a clean and healthy condition that it makes worm development impossible.

International Stock Food Tonic is endorsed by the best known Hog raisers the world over. It has never been equalled for promoting rapid growth, and enabling Hogs to stand the forcing process without loss of vigor or digestive powers.

The cost to use this preparation is remarkably small—"3 feeds for one cent." Just try it on one batch of Hogs. You will be quickly convinced of the big extra profits it will make you.

Sold by dealers everywhere, 50c. and $1.00 packages. $1.50 lithograph tins, and 25 lb. pails $3.75. Buy from your Local Dealer. If he cannot supply you, write us direct.

INTERNATIONAL STOCK FOOD CO., LIMITED

202

LONG WIRES

THE nightmare of the fence manufacturer is a problem of turning out fence with horizontal wires of even length—each wire having exactly the same tension as the one next to it.

While mechanical improvements in fence weaving machinery have helped, still, accuracy in product is the result only of eternal vigilance on the part of operators and expert overseers. This improved machinery and expert supervision costs much money. But we prefer to pay the price, so that we can build our trade on the reputation for accurately-made fencing, and consequently satisfied customers. We could turn out cheaper fencing, if so minded, but we won't. We know such fencing would not be RIGHT, and we are pretty sure it would not pay in the long run.

Be careful in selecting your fencing. When you are ready to hear from us, ask for our 1917 printed matter.

Butter Parchment at the Farmer Office

Break in Wool.—Wool, weak at one particular point of the staple, above and below the break the wool is usually sound.

Broken Wool.—Wool that has been torn or become detached from the fleece.

Broad.—A straight-fibred, non-elastic wool.

Carbonizing.—A chemical process by which all vegetable matter is destroyed in the wool.

Carding.—An operation which prepares the wool for future manufacturing processes by disentangling the fibres and rolling them in the form of rope.

Casing.—To separate and pack fleeces of the same quality in bales or sheets.

Classing.—A term used in Australia for grading of fleeces after being skirted.

Clothing.—A term applied to wool of not sufficient length to be used for not sufficient length to be used for Combing purposes.

Combing.—A term applied to wool having sufficient length to be especially adapted for the Worsted process of manufacture. Length of combing wool is usually 3 inches or over.

Come-Back.—The wool from a sheep which is the off-spring of mating a fine wooled ram with a ewe, the result of a cross between a fine wooled ewe and medium or long wooled ram.

Cotted.—Wool, matter either through lack of feed or sickness, which stops the flow of a sufficient amount of yolk in the wool, and thus creates felting of the fibres on the sheep's back.

Crossbred.—Wool from a sheep, being the off-spring of a cross between fine and medium long wooled sheep.

Character.—A true, sound stapled wool with evenness of quality and regularity of crimp and serrations.

Cow-Tail.—Refers to wool of extremely low quality corresponding to hair, found at extreme end of the fleece.

Crimp.—The waviness of the fibre. The greatest number of crimps are found in the fine wool of high elasticity.

Coarse.—A low grade of wool produced from sheep with but little or no trace of Merino blood.

Demi-Lustre.—Wool that is not sufficiently lustrous or bright to be classed or graded with pure-bred Lustre Wool.

Down Wool.—Wool produced from the Down or dark-faced breeds of British sheep.

Density.—Means the number of fibres produced on a given area of the sheep. The greater the number of fibres, the greater the density.

Delaine.—Wool produced from fine wooled sheep and of sufficient length to be suitable for use in Worsted manufacture.

Defective.—Wool, discoloured, moth-eaten or containing vegetable matter.

Degreased Wool.—Wool from which the grease and dirt have been extracted by the Naphtha process, in a machine especially designed for the process and perfectly sealed to prevent Naphtha fumes from escaping.

Domestic.—Refers to wool shorn from sheep raised under farming conditions.

Felting.—The property wool possesses of matting or felting together.

Fellmongering.—A term used to describe the removal of wool from sheep pelts.

Fribs.—Denotes short greasy locks and second cuts.

Fall Wool.—Wool shorn in the fall which represents a five to six months' growth and is the second shearing within the year.

Frowsy.—Wool, dry and harsh, owing to lack of sufficient suint.

Grading.—Term used for arranging fleeces into qualities or grades without untying the string.

Gritty.—Wool containing an excessive quantity of sand or grit.

Grease Wool.—Wool shorn from the sheep in its natural condition.

Hog or Hogget.—This term is applied to the first fleece taken from a sheep.

Kempy.—Wool that contains hair-like fibres, which will not take the dye.

Line Fleeces.—A fleece that is, in quality and length, between two grades.

Lambs' Wool.—Wool shorn from lambs.

Lean Wool.—Wool with very poor spinning properties.

Lustre Wool.—Wool having a glossy appearance, produced mostly from pure-bred Cotswold, Lincoln and Leicester sheep.

Lofty.—Wool of a springy nature and a high degree of elasticity.

Matchings.—Portions of fleeces of the same quality from which all inferior wool has been removed.

Modock.—Wool from sheep, raised under ranching conditions; subsequently shipped to farms and there fed and shorn.

Noil.—Short fibres which have been extracted from the long fibres by the combing process.

Off-Sorts.—Wool, sorted from a fleece such as fribs, stained, clips, britch and belly piece.

Pulled.—Wool taken from pelts which have been washed and treated with chemicals to open the pores in order that the wool may be pulled from the skin easily.

Quality.—Refers to diameter of fibre and spinning properties of the wool.

Regain.—The increase in weight of dry, hot wool, exposed to the air.

Rejection.—A term applied to wool containing considerable vegetable matter, black, cotted or kempy fleeces.

Range.—Refers to wool shorn from sheep raised under ranching conditions.

Run-out Wool.—Wool lacking character and with an exceedingly large percentage of off-shorts.

Skin-Wool.—Wool removed from sheep pelts.

Shrinkage.—The actual weight lost in wool scouring.

Stained.—Wool which is discoloured by coming in contact with urine, manure, etc.

Scouring.—Refers to the process of removing all extraneous matter from wool, making it perfectly clean for manufacture by machines especially adapted for the purpose.

Skirtings.—The off-sorts taken from the fleece by removing all the outer edges.

Slipe Wool.—Wool removed from pelts which have been treated with lime.

Shafty.—A good, long, well-grown and strong-fibred wool.

Shivy Wool.—Wool containing small particles of vegetable matter.

Shearlings.—Wool pulled from the pelts of sheep which have been slaughtered after shearing time, consequently it is short fibred, also a term applied to one-year-old sheep.

Staple.—A tuft of wool fibres clinging together, held in place by binders, which in turn connect the staples together forming a fleece; also a term used to denote the combing length of Range or Territory wool.

Semi-Bright.—Wool too dark to be classed as bright; but lighter and brighter than range or territory.

Top.—The product of the process of combing, after the noil has been taken out and the fibres laid parallel in one untwisted strand.

Territory.—Refers to wool shorn from sheep raised in the Western States of the United States.

Tags.—Locks heavily besmirched with manure.

Tubwashed.—The result of a system of washing wool in the fleece, after shearing, by some farmers.

Teg.—Wool shorn from a shearling or yearling sheep; especially used in connection with the Down breeds.

Unwashed.—Wool shorn from sheep in its natural condition.

Unmerchantable.—Wool that has been poorly washed upon the sheep's back or the wool allowed to remain on the sheep for some time, before shearing, after having been washed.

Wiry Wool.—Wool with very poor spinning properties owing to lack of elasticity and pliability of the fibre.

Washed.—Wool shorn from sheep washed just prior to shearing.

(Continued on page 416)

Don't Worry

about the future size of your herd

The capacity of the Standard cream separator is interchangeable. You take no chance on your future separator requirements. If later on you find that you need more cream separator capacity to take care of your larger herd, all you have to do is to replace the bowl and fittings—not the whole machine, if you have the

Standard

Interchangeable Bowl

This bowl and casing lift right out—easy to replace with a larger size.

This important, exclusive feature is certainly a money saver to dairymen and farmers. It costs a great deal less to interchange bowls with the Standard than to exchange the entire machine for a new one. Putting in the new bowl means no loss of efficiency, for the bowl is changed complete. The gearings of all Standard machines are made for 100 pound capacity. Think of the over-capacity advantages you have in 350 to 800 pound Standards!

All you have to do in order to change a 350 pound capacity machine into a 450, 600, 800 or 1000 pound machine is to substitute your bowl for the different capacity bowl and attachments that you require. We accept the used bowl in exchange, less reasonable allowance for wear and tear. So you see you need not worry a minute about the size of machine you buy now.

Other features of the Standard are its low supply can, splash oiling system requiring attention only every three months instead of daily oiling, and its close skimming capacity; the Standard gets all but one-tenth of a pound of cream per 1000 pounds of milk skimmed, while other separators lose half to a whole pound of cream. Write for free literature.

Head Office and Works, RENFREW, ONT.

Agencies almost everywhere in Canada. Eastern Branch: SUSSEX, N. B.

A START WITH QUALITY LIVE STOCK ON A FORMERLY ABANDONED KINGS COUNTY FARM.

A Farmer representative had the pleasure, a few days ago, of visiting the home of Mr. and Mrs. P. J. Lively, Mt. Middleton, near Sussex.

Mr. and Mrs. Lively are natives of Sussex, England. They have spent several years on large sheep ranches in the Argentine Republic, Patagonia, and in the Canadian West. They purchased their present home about a year ago, and have named it "New Farm", after their old homestead in England.

They have established a small flock of pure bred Oxford Down sheep and already have a 100 per cent crop of lambs frisking about. They have also established the foundation for a herd of pure bred Large Black Swine, by importing a trio from England, where the breed is rapidly gaining in popularity.

So far as we know, there is not another herd of Large Blacks in the Maritime Provinces, and only very few in Canada.

In the poultry line they have established a flock of Light Sussex fowl. Their flock of 20 hens laid 476 eggs during the month of March.

Mr. and Mrs. Lively purchased, what is commonly known in New Brunswick as an abandoned farm. Woven wire fences have already supplanted the broken down pole fences, and other improvements show that Mr. Lively knows his business and is beginning in the right way. He is aiming to establish quality bocks and herds by purchasing the best he can find for his foundation stock. We predict and wish Mr. and Mrs. Lively every success in their new, hospitable home.

DAIRY DIVIDEND

The Directors of the Pictou County Dairy Co., Ltd., recommend the payment of a seven per cent. dividend on the paid up stock of the company. During the past year 113,209 lbs. of butter was made at the creamery at Stellarton and $34,147.43 paid to the farmers for cream and $1,161.20 for milk. At the beginning of the year they had butter on hand to the value of $296.84 and closed with $1,985.20 worth in stock. During the year they sold, Butter $35,206.83; Buttermilk, $1,707.59; Milk, $1,387.68; Sweet Cream, $1,030.89; Cheese, $16.99. The total amount received for the products of the firm was $41,038.34. After paying all expenses the profit of the year is $1,529.47. The paid up capital of the company is $9,730.00 and while they carry in addition temporary loans of $4,400, the statement shows a surplus of assets over liabilities of $4,504.66. W. J. Maxwell and Son, of Mt. Thom, top the list of patrons, having supplied 6,966 lbs. of cream, for which they received $866.84.

One item in the receipt column is Government grant $100.00. It is small, but in view of the splendid showing made for the year the company might easily step out of the bonused class.—Eastern Chronicle.

DAIRY COURSE FOR THE MARITIME PROVINCES

The first Short ,Course in Dairying under the auspices of the three Maritime Provinces, was held at the College of Agriculture, Truro, N. S., from Mar. 7th to Mar. 31st. The first two weeks were devoted to creamery work and the second two weeks to cheese factory work. The course was only open to cheese and butter makers having at least one year's experience.

The College Dairy was specially fitted up for the course with the latest in creamery and cheese factory machinery, including two makes of pasteurizing vats, combined churns, printing machines, starter cans, moisture, salt and acid tests and for cheese making, agitating vats and new type curd mills, etc.

The attendance was much larger than was anticipated, the total enrolment being forty-one. The College staff took an active interest in the work and gave instruction in special subjects such as Milk Production, Chemistry, Bacteriology and Veterinary Science. Special instructors were secured as follows: Cheese Making, Mr. George H. Barr, Chief of the Dairy Division, Ottawa; Butter Making, Mr. Mack Robertson, Belleville, Ont. and Mr. F. T. Morrow, Creamery and Cheese Factory Inspector of Prince Edward Island; Milk Testing, Mr. C. W. McDougall, Supt. of Dairying, Sussex, N. B.; Cream Separators, Mr. Ben Gallant, St. Louis, P.E.I. The Course was in charge of Mr. W. A. MacKay, Provincial Dairy Superintendent.

Five Good Reasons for Buying this Good White Lead

1. It is absolutely pure, ensuring the brilliancy of any paint in which it is used.
2. It has great covering capacity and long life.
3. It is of unequalled, uniform "fineness"—is never crystalline.
4. It works easily under the brush.
5. It need not be scraped or burned off when, after several years, the building requires another paint.

Its high reputation has been gained by nearly 200 years continuous manufacture. Used and recommended by experienced architects, builders, painters, owners.

Shubenacadie, N. S.

PREPARING FOR WOOL SALES

(Continued from page 413)

Wether.—Refers to all fleeces removed from sheep subsequent to the first sharing, also to a castrated male sheep.

Yield.—The amount of clean wool suitable for manufacture after the grease and foreign matter have been removed by the scouring process.

THE LOOKING GLASS AS A MACHINE

Defining a machine we say, "A machine is a device that makes work easier and accomplishes that work in a shorter period of time." Among some of the simpler machines we find the button hook, scissors, knife, etc. Probably you are wondering just how the looking glass may be likened to a machine. Everyone is familiar with its use in the household. But a small mirror is often a very convenient machine for reflecting light into a dark place where work must be done. Again, it may be used in getting a straight line by means of reflected sunlight. It is commonly used by engineers in producing a line through dense brush, thus eliminating the work of clearing away thick brush or undergrowth. Again, by means of the mirror and the use of sunlight, men are able to dig deep holes into the ground or tunnels through the mountains. Its principles are made use of by some of the greates astromers by reflecting the light from the star to the eye of the observer.—Frank P. Goeder, Colorado Agricultural College, Fort Collins, Colorado.

SALT SOLUTION USEFUL IN CONTAGIOUS ABORTION

A salt solution of the proper strength is stimulating to mucous membranes and is an excellent antiseptic. It is recommended to farmers and stockmen in case of contagious abortion of cattle. A heaping tablespoonful of dry salt weighs approximately one ounce and this amount added to one gallon of boiled water, and used at body temperature, makes an excellent irrigating fluid.

Mr. J. B. Daggett has tendered his resignation as Secretary for Agriculture and has accepted the position of manager for New Brunswick for the Canadian Fertilizer Company. He has also accepted the position of representative of the Goold, Shapley & Muir Company, Limited, Brantford, Ontario, manufacturers of water supply goods, concrete mixers, grain grinders, gasoline and kerosene engines, traction engines, wind mills, etc. Mr. Daggett's territory for the latter company for the present is the River Countries.

By O. C. Hicks

Editor The Maritime Farmer:—

We already know so much about the clovers commonly grown in the farm economy that there would seem to be no warrant for this special commendation of this group of plants to the farming community, (N. B.) But the fact that so many erroneous ideas prevail oncerning the seeding habit of common red clover and the consequent evil which the farmers and the agricultural interests of our province have suffered, is given as sufficient reason for the following remarks.

The popular idea as to the distinguishing characteristics of any of the clovers, is that the leaves occur in threes, (Trifolium) that it is a leguminous plant, that is, one which bears its seeds in a pod or husk, and that it exercises a peculiar influence of building up the soil fertility. Many of them are our most highly prized forage crops among which Common Red Clover holds the premier position and may well be styled 'the queen of forage plants of New Brunswick.'

A story of the origin, history and introduction of the various clovers up to the time of their adoption into our cropping systems is a romance. I presume that some of them were to be found in the garden of Eden, others, have been discovered by explorers in almost inaccessible parts of the world and through them brought to us.

The following varieties of 'clovers' which occur either wild or as cultivated in the ordinary cropping systems of the province, each of which possess real merit, will herein be discussed:—

Red Clover (Trifolium pratense), White Dutch Clover) T. repens), Alsike Clover, (T. Hybridum), Sweet Clover, (White Melilotus alba), Alfalfa (Medicago Media) and Yellow Hop Clover, (Trifolium Agraricum). All of these varieties will be found worthy of consideration for some special purpose in almost any locality of the province.

The most valuable to our agriculture is the common red variety—with its sub-sort known as the long, late or mammoth red clover; while the least valued is Sweet Clover. There is also a yellow type of sweet clover (M. Offiern alis), both of these are valued highly as honey plants.

Clovers differ from one another in habit of growth, duration, persistence in growth, ability to withstand low temperatures, seeding habit and palatibility. Alfalfa, White Dutch and Alsike are of perennial nature. Red and Sweet Clover are classed as biennials.

There are two characters common to all clovers which are of especial significance viz.: their high protein content; 2. they are insect fertilized, i. e., entomophilous. To this latter character is due the fact that there are no natural 'pure lines', and herein

(6) By Cultivation—In some a quick-growing plant of the Common Red sort, occassionally an annual; to the slower maturing mammoth red sort, among which plants exhibiting a perennial habit are frequently found.

The several varieties mentioned are variously adapted to rotations, this adaptation lessens as the natural period of life of the plant lengthens, consequently alfalfa is not so well suited to short rotations, while the red variety is much favored. This variety is more commonly sown to provide hay rather than pasture in the first crop obtained.

Probably the most profitable rotation to our agriculture, in which red clover thrives for at least a part of three years, is the four-year rotation including—(1) small grain, wheat, oats or barley, seeded with timothy and clover; (2) hay; (3) hay or pasture; (4) roots, (potatoes), helped out corn, and sometimes a mixture of peas and oats for soilage purposes.

With reference to adaptation to soils, red clover thrives exceptionally well on upland which has been cleared from a growth of hardwood timber. The so-called Mammoth, or long-late variety, appears to withstand drought conditions better, as the common red is characterized by a rapid growth in early spring and consequently demands a continuous supply of moisture to produce a persistent growth until autumn, whereas the long-late type produces but very little growth after the first cutting.

Alsike clover, besides being adapted to clay soils, grows well on low-lying wet soils, which are well stored with humus—likewise the White Dutch variety.

Alfalfa requires especial attention as to its habitat, while Sweet Clover is least particular of any of the clovers, and will grow in infertile soils and exposed situations.

The yellow hop clover grows wild in profusion along the line of the Gibson branch railway in York County, and is becoming very common in other parts of the province also. It is a good pasturage plant, particularly in the early stages of growth.

All clovers like deep soils of humus and heavy clay mixture, and practically all have a fondness for a soil containing a liberal supply of lime or calcium, which makes the soil basic in character rather than acid. Good drainage, lime and humus are therefore three requisites of a soil in which clover will thrive, and for a general stimulant and fertilizer, wood ashes are very effetcive.

In a humid climate, such as prevails in the Maritime Provinces, clovers are usually sown with a nurse crop, with plants, ing of the crop several times which the clover crop is regarded as secondary, hence the preparation of soil for the grain must suffice for the clovers also. A proper appreciation given to the securing of a good catch of clover, would often result in more attention being paid to the preparation of the seed bed to the benefit of both crops. Sowing is almost invariably done in the spring, and as a rule the earlier the sowing is done the greater is the prospects of a resulting catch.

A general impression prevails that seeding down with a grain crop is the only practicable, economical method of securing a productive hay-field. Associated with this idea is the custom of sowing grass seed too thin to secure a heavy yielding mowing. It is difficult for grass and clover to be too thick. Hide-bound hay fields are not caused by thick seeding, but because of being overrun by wild grasses and weeds, which spring up when the good grasses are enfeebled by mowing, especially if the mowing is followed by dry weather.

Failures to secure a good stand of clover are frequently due to mistakes of seeding. (1) Too little seed used. (2) Nurse crop sowed too thickly. (3) Seed covered too deeply. (4) Sown too late in spring, that the plants suffer from hot weather, or exposure to rays of sun reflected by a stubble field.

It is well to keep in mind the fact that of any four farm crops, the hay and pasture crop is the essential one, and the one which is most cheaply harvested. Therefore see to it that your mowings are conditioned and then, feed them well.

All the clover seed used in the province should be produced within the province. The results in clover-seed production secured last year show that the growing of clover seed can profitably become a part of the regular cropping systems of N. B. farms.

Seed is produced by either first or second crop red clover.

The advantage in securing seed from second crop is that a hay crop has already been procured and the seed crop is of the nature of a bounty. "To him who hath clover, other things shall come in plenty."

In sections where clover-seed growing is well established, the second crop, produced after cutting or pasturing the first crop before the latter part of June, is relied upon because of the infestations of a fly,—the clover seed midge, which prevents the formation of seed in the first crop of flower heads. With the removal of the hay crop to the barn when these insects are in the maggot stage, the during ble?. Is it liable to spread to other otherwise there are two broods yearly which prevent the forming of seed in both first and second crop of clover.

Infertile ovules are of common occurance in red clover flower heads and occur to a considerable extent throughout the season. The largest percentage of infertility has been found in first crop clover,—usually accompanying moist soil and atmospheric conditions. With such blossoms the presence or absence of bees has no effect, as the ovules have no reproductive cells, hence there can be no fertilization and no formation of seed.

It is believed, however, that weather conditions during blossoming time, which accelerate the activity of bees greatly affect the seed yields, for red clover is practically self-sterile and pollen must come from a separate plant in order to effect fertilization and seed production. As carriers of pollen, bees, both honey bees and bumble bees, are the only efficient agents.

The inexperienced clover seed grower is likely to believe that the uncertainty of securing a good setting of seed justifies his usual course of cutting the hay and perhaps pasturing off or plowing under the aftermath, but since he is farming for profit, any knowledge which enables him to know with certainty that he has a money crop on hand, lessens his chances of losses.

The seed formation of red clover in the early stages of growth, can be readily observed by cutting the flower heads lengthwise with a sharp knife. A little later seed-bearing heads may be detected by a certain plumpness when squeezed between the thumb and fore-finger; still later these heads will turn brown. This color, allied to the hardness of the heads, when observed in any large proportion of flower heads, is indicative of a profitable seed crop, whether occuring in first or second crop.

Given a good stand of first crop clover, common red, mammoth red or alsike, there are several features which when considered, will help to determine whether the crop would be more profitable as cut for hay or whether to allow it to mature a seed crop.

The value of the threshed hay is considerably lessened indeed, if it has been left in the rain for a long time, the straw has little value for feeding purposes. It is valuable for bedding, as it is a good absorbent of liquids. There is also the cost of threshing and cleaning operations. On the other hand, should the seed crop be harvested and stored without much weathering, the straw, especially that of alsike clover, has considerable feeding value and may be fed to cattle and sheep.

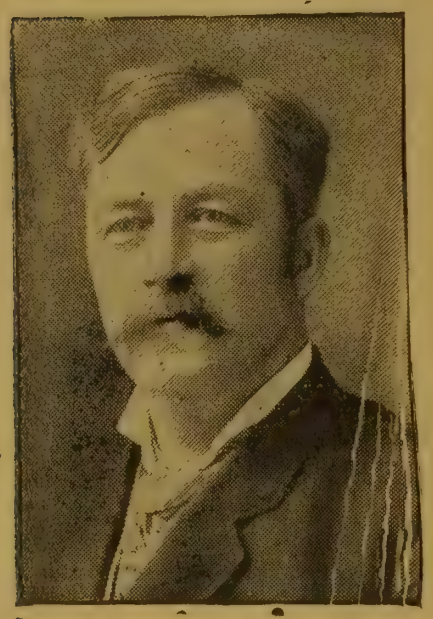
Increased Food Production Campaign for N. B.



HON. J. F. TWEEDDALE
New Brunswick Ministry for Agriculture.

Realizing the fact that the British Empire and her allies are now facing the greatest crisis since Adam left Eden and that the chief essential, necessary to overcome this crisis, is an abundant food supply, so that our troops and people generally may be sustained, till the German hosts are conquered, Hon. W. E. Foster, the Premier and Hon. J. F. Tweeddale, New Brunswick's Minister for Agriculture, invited prominent agriculturists and others, directly or indirectly interested in food production, to a conferenc at Fredericton on May 4th, to discuss and formulate plans how New Brunswickers may best do their bit behind the front in efforts for increased production of food supplies.

Despite the short notice, the response to the invitation was most encouraging and delegates from all ranks of productive industries were present from every section of the province.

The meetings were held in the annex of the Provincial Normal School.

The premier called the meeting to order and in the course of his address intimated his desire that the farmers, who are the real producers, express their views on the possibility for increased production and the essential aids required to accomplish maximum results. He read a telegram from ex-Premier Murray expressing his unability to be present and pledging his co-operation in every possible way to promote the success of the increased production movement.

Lieutenant-Governor Wood expressed his hearty support and said that while we in New Brunswik have every faith in the power of the Allies, we must not be over-confident and rest on our oars. It is absolutely necessary that we provide food in abundance and organize our efforts under expert direction.

Hon. J. F. Tweeddale pointed out that, owing to the seeding season being now here, immediate action on the part of every interested individual and organization must unite their efforts, backed up by the government. He quoted some of the world's greatest authorities on the food supply question and the danger of a world-wide famine. He asked every one present to use their very best influence to help avert such a disaster.

Mr. W. B. Snowball then took the floor and outlined what Sussex Farmers' Club proposes to do to cultivate vacant land, with the aid of school pupils.

L. P. D. Tilley, Director of the National Service Board for New Brunswick was present, and gave the assurance that the National Service movement would render the movement under discussion every possible assistance.

Dr. W. S. Carter, Chief Superintendent of Education, suggested that the schools should co-operate, and any pupils in good standing on May 1, should be allowed their standing for the year, if they went to work on Farms.

There should be local organizations to facilitate this. The school inspectors should be released to devote their time to this work, and household science teachers should be enabled to give instruction in canning and home economy.

Prof. M. Cumming of Truro, pointed to the serious shortage in beef, mutton and pork products as something that must be coped with from the Dominion and continental standpoint. He disapproved of the indiscriminate slaughter of young calves and suggested that the consuming public endorse the slogan "Eat no Veal", while the meat situation remained at such a low ebb. It was too late to acquire wheat and fertilizers at this late season. Oats, potatoes and beans should be grown in abundance. Every farmer and town gardner should try to double his crop. School boy labor is being utilized in Nova Scotia. He strongly espoused the idea of a National Service Sunday, for production has been raised to the plane of a moral duty.

He had tried to get supply of fertilizers from England, but the Imperial Government replied that they needed it all at home.

SA 5iz5CMeC.1G fcAd. .C51I51Pm.c

Hon. C. W. Robinson moved that a nominating ommittee of five be appointed to name a provincial committee to co-operate with the agricultural department and assist by every means possible the work of increased production. This was adopted, and M. A. MacLeod, T. H. Estabrooks, H. V. Dickson, Rev. L. Guertin and F. W. Thompson were appointed.

F. E. Sharpe moved that in order to further stimulate production of high grade seed oats, wheat, potatoes and possibly other crops for the seed needs of next year, there be a large prize list for field crops, and also competition for increased farm production including live stock, with substantial money prizes; and that national service diplomas be awarded. This was adopted.

W. Frank Hatheway moved that school pupils be mobilized, inspectors released to co-operate in this work, and household science teachers be engaged during vacation to give instruetions in canning and economical use of food. This was adopted. Mr. Hatheway thought it would help if farmers could be guaranteed a certain price for their products next fall. This would be a great incentive.

Farm Laber Scarcity

G. E. Porter moved that it was advisable to organize labor bureaus in the province, to secure all available help on the farm. Mr. Porter said the farmers were limited because they could not get labor. The prices this year and next would induce the farmer to produce to the limit, but he needed labor. The resolution was adopted.

Dr. Borden, of Sackville, congratulated the premier and government on the splendid gathering. There had been much talking but here was something definite that would briny results. He moved that May 13 be declared national service Sunday and a joint message on food production signed by the minister of agriculture and director of national service be sent to every clergyman in the province, with a request that he read it and deliver a sermon or address on the subject. This was adopted.

C. M. Leger said he anticipated great results from this conference. Not only farmers but the people of cities, towns and villages must do their part. He moved that owners of vacant lots in these centers and the commercial and industrial workers be earnestly requested to co-operate in the cultivation of the greatest amount possible. This was adopted.

Prof. J. W. Robertson

Prof. James W. Robertson delivered a most impressive address, dealing with the great crisis which confronts the world and the absolute necessity of increasing food production. We must produce whether at a profit or at a loss, in order to save humanity. He dwelt upon what the women of France are doing and made a most stirring appeal to the people of New Brunswick to do their full duty.

He told of the Frenchman who declared that if the French accepted peace on Germany's terms, their dead would rise up to spit in their faces

New Brunswick's New Deputy Minister of Agriculture

Following the defeat of the Murray Government in New Brunswick, Hon. Walter E. Foster, the new premier, put Hon. J. F. Tweeddale of Victoria County in charge of the Department of Agriculture. On assuming the reins of office of this important position, Mr. Tweeddale realized the necessity for a re-organization of the staff with a view to making the department efficient and helpful to the furtherance of the agricultural interests of the Province.

His first aim was to get a strong, practical leader of men as ris deputy. Unqualified party politicans and aspirants for the position were disregarded. Mr. Tweeddale looked for a man who had a reputation for efficiency.

The Maritime Farmer is delighted with the stand Mr. Tweeddale has taken and wish to congratulate him on his success in procuring as ris deputy, Mr. W. R. Reek, B. S. A., an Ontario boy who has a reputation for making good, to back up both a practical and theoretical knowledge of the work which he will have the honor and privilege to guide in New Brunswick.

W. R. REEK, B. S. A.
Secretary of Agriculture for New

Mr. Reek was born in 1882 on a large stock farm in Ontario, upon which he remained until the fall of 1906, when he entered the Ontario Agricultural College, Guelph. He graduated from the O. A. C. in 1910. During the summers of 1908 and 1909, Mr. Reek did efficient work in the Under-Drainage Department under Prof. W. H. Day. In the summer and fall of 1910 he was in charge of the Drainage Campaign for Ontario. In 1909 he was a member of the stock judging team representing the O. A. C. at the International at Chicago.

In 1911 he was appointed private secretary to the late Dr. C. C. James, then acting as Minister of Agriculture for Ontario. As secretary to Dr. James, Mr. Reek gained an insight, under the tutorship of one of Canada's most practical and learned agriculturists, into how the Department of Agriculture of a province may be efficiently conducted. When Dr. James received his commission at Ottawa in 1912, Mr. Reek was transferred to the Ontario Government's Office in London, England. He was recalled in October, 1913, to take the position of Associate Prof. of Animal Husbandry in the O. A. C., where he remained until 1915, when he was appointed to look after the Federal Grant appropriations upon Prince Edward Island. He resigned his position in Prince Edward Island on March 1st of this year to become assistant to Dr. G. C. Cuelman, Commissioner of Agriculture for Ontario. We believe Hon. Mr. Tweeddale will give Mr. Reek a free hand to exercise the best of his abilities to make his work in the province a success. We know we voice the sentiments of our readers when we say that we heartily welcome Mr. Reek to New Brunswick, and that we all

CO-OPERATIVE PURCHASING

Did you read the article on co-operative purchasing of cotton seed meal in the last issue of The Maritime Farmer? If not, and you chance to be an interested dairyman, read it today. Excellent reports are reaching us daily about the movement. The country is ripe for such a price smashing plan. It will mean a saving of thousands of dollars to Maritime Farmer readers who participate and that without any extra effort on their part. Talk the matter over with your neighbors and let us know your requirements. We will send one of our representatives to talk it over with you.

The Maritime Farmer,
Sussex, N. B.

the speaker, "because we at home fail in our duty.

The United States has two-thirds of a wheat crop, the Argentine has prohibited export and India and Australia are far away from England. Canada should strain every nerve to increase the supply. Twenty cents worth of beans has as much nourishment as $1.25 worth of beef steak, or $1.40 worth of eggs at present prices, therefore beans should be extensively grown this season.

High prices will prevail for a number of years, and there will be ample market for all crops produced at remunerative prices.

J. E. Porter referred to what the women of New Brunswick have done and are doing and suggested that they be rewarded with the franchise.

Hon. Mr. Tweeddale outlined what the government had done in the matter of getting seed oats and barley and said they hoped to have some wheat. But they were trying to do now what should have been done in January or February. The department would assist in every way possible.

Deputy Minister Reek of the agricultural department, said that in addition to inreasing production there should be an elimination of waste in the cities and towns. Food reserves in the world have been used up and farmers need not worry about returns.

Provincial Committee

The nominating committee submitted the following provincial committee: Albert: T. A. Goggin; Elgin, C. J. Osman, Hillsboro. Carleton; George Upham, Woodstock; Harry Smith, Florenceville. Charlotte: J. M. Scovil, St. Stephen; Howard Grimmer, St. Andrews. Kent: J. D. Irving and Hon. Dr. Landry, Buctouche. Kings: J. T. Prescott and J. D. McKenna, Sussex. Madawaska: Dennis Daigle, Baker Lake; B. R. Violette, St. Leonards. Northumberland: George E. Fisher and A. G. Dickson, Chatham. Gloucester: John J. Miller, Bathurst; Joseph Theriault, Pacquetville. Queens: T. Sherman Peters, Gagetown; Isaac Baird, Chipman. Restigouche: Edwin LeVasseur, Anderson Settlement; R. L. Hicks, Dalhousie Junction. Sunbury: H. H. Smith, Hoyt Station; Charles Gilmour, Oromocto. St. John: E. A. Schofield, R. R. Patchell. Westmorland: O. M. Melansor, Shediac; J. W. Carter, Salisbury. York, James S. Neill, Fredericton; William Moore, Scotch Lake. Victoria: Donald Fraser, Plaster Rock; Abraham Kupey, Andover.

Miss Hazel Winter spoke for the women's institute. F. A. Dykeman urged that a slogan be adopted. Rev. J. Guertin, A. G. Dickson, C. Alward, James Gilchrist, Mrs. Lawlor and Mrs. Gray made practical suggestions, the ladies dealing with the high cost of living, and offering some kindly counsel to the farmer, from the housewives point of view.

At the evening session, Dr. Jas. Robertson paid a particular compliment to the "silent eloquence" of the British navy, of which he had been a personal witness. He also gave a most graphic description of conditions in France, which he visited last Autumn as an official representative of Canada. The speaker particularly emphasized the sacrifices which the French were making for freedom and right. He told how he had seen the old men, women and children at work in the fields, doing their bit to keep up the food supply, an eloquent example for our Canadian men and women to follow.

His Worship Mayor Hayes of St. John expressed his hearty support of the movement.

Dr. Kierstead thought the government could well follow the lead of the Canadian West and arrange short term loans for the farmers on easier terms than they can now secure.

Br. Buckley of the Y. M. C. A., promised the support and co-operation of the Association, in the attempt to have boys employed on the farms, and instanced what has been done in Nova Scotia.

Mrs. Lawlor asked when will the Ottawa government set in motion the machinery against combines. She would like to see local combines investigated.

C. F. Alward said farmers too often sowed four to five bushels of oats to the acre, when two bushels to two and one-half was enough. He urged providing lime to help the fertilizing of many farms.

James Gilchrist said the movement to get school boys on the farms would help solve the labor problem, and that the government should do something towards solving the capital side of the question.

Rev. Dr. Guertin said that through circumstances, he was boss of a farm when eleven years old, and that boys could do most valuable work. We must plan not for this year alone, but for next year. With the bravest men and best equipment we cannot win the war unless the men are fed.

He advised his hearers to invoke the blessing of God on any efforts they may make to increase production, for it is God that giveth the increase. We must be his partners.

The greatest enthusiasm was in evidence throughout the sessions, and the various delegates returned to their homes not only impressed with the great need for every effort to increase, but to put in practice as best they can, every plan that they think will help keep the Empire's food supply in a stage of efficiency and sufficiency.

GROW THINGS

Professor Cumming's Message to the farmers of Nova Scotia through the New Year number of The Morning Chronicle may well be repeated at this season. He sounded the keynote of Patriotic and Profitable Service on the farms of Nova Scotia as follows:—

"It made no difference what was grown on the farm in 1916, there was a demand for it and top prices at that. Hay may be quoted as an exception, but it really is not, for the bulk of the hay should be manufactured on the farms into beef and mutton and milk, for which products there is an unlimited sale. The pity is that we did not grow enough crops and that we have not enough to sell right now. Potatoes at over $1.00 per bushel, oats climbing towards the dollar mark and other products equally high have swollen the bank account of our good 1916 farmers. Butter, at over 40c, beef at 15c, eggs at 50c, have also been great money makers when the farmer has been able to feed mainly fodders grown on his farm. But when he has had to pay nearly $40.00 per ton for bran and proportionately high prices for other mill feeds, the possible profits from the live stock branch of his farm have been greatly reduced—not so has it been with the farmer who "grew things."

Certainly "Growing Things" Does Not Impoverish the Land.

There used to be an old idea prevalent in the country that big crops robbed the land. And this idea was correct when big crops of hay and oats, etc., were sold off the farm and no returns made to the fields that produced the crops. But when live stock of all kinds are fed these crops, the animals retain in their systems only from five to twenty-five per cent. of the fertilizing ingredients contained in the fodders, the balance accumulating in the barn yard manure. And when this manure is properly conserved and put back on the farm there is little waste of the fertilizing materials at first removed from the soil. Such wastage as occurs is largely made up by the enriching qualities of clover and other leguminous crops which, as they grow, abstract fertility from the air, and by means of their deep roots, bring up plant food from the lower [illegible] crops, like potatoes, garden truck, and even sometimes hay and grain, must be sold, but with most of these crops the drainage falls upon labor rather than a large amount of soil fertility, and the small deficit in fertility that does occur is fully offset by the judicious use of commercial fertilizers which will more than pay the farmer [illegible] ing of the crop several times during so it transpires, as was often urged by the late Jas. J. Hill, that the growing of plants is the one means of exploiting nature without impoverishing her, in which respect agriculture is contrasted with mining and similar processes of extracting wealth from nature which becomes so much poorer as each ton of coal or other substance [illegible] ble? Is it liable to spread to other

The Growing of Plants is the one means of exploiting Nature without Impoverishing Her.

Growing Things Makes the Farmer and the Country Richer and Yet Conserves the Future.

The Lesson of 1916 to the Fruit Growers Seems to be the Need of Faith That will Compel Him to Grow Things.

Every Provident Nation Encourages its people to Grow Things.

It Means Sacrifice, but War Times are Times of Sacrifice, and the Farming Community Will Not Take Second Place to Any in Its Willingness to Sacrifice.

GROW THINGS IN 1917.

RETURNS FROM FARMS OF NOVA SCOTIA 1916.

CROP	TOTAL YIELDS (bushels)	VALUE
Oats	4,794,430	$3,595,822
Wheat	426,660	853,320
Barley	167,384	217,600
Buckwheat	243,075	243,075
Peas	300,621	11,863
Beans	22,365	134,190
Rye	21,128	26,400
Mixed Grains	146,619	183,273
Corn for husking	6,708	11.608
Potatoes	7,139,160	6,425,244
Turnips	6,866,200	825,916
Mangels	590,320	70,839
	Tons	
Hay	1,030,620	10,306,200
Corn and other forage crops	27,384	82,152
Garden truck and small fruits		1,400,000
	Barrels	
Apples	600,000	1,500,000
TOTAL		$25,886,962

The striking feature of the figures for 1916 compared with those of 1915 is the increased value of the cereal and potato crops and the decreased value (despite the big yield) of the hay crop. The one has just about offset the other. In addition to the foregoing, should be included at least 50 p. c. of the returns from such live stock products as milk, butter, wool, lambs, etc., a large proportion of which are produced on pastures of which no reckoning has been made in the table. Moreover, there should be included with this an estimate of the profits made from feeding purchased and home grown feeds to live stock. The additional income estimated on these scores is $8,000,000. Thus the grand total value of the products of Nova Scotia farms for the year 1916 is **$33,886,962.**

view may be considered the result of the abstract reasoning of a scientist, it is only necessary to corroborate it by referring to many farms in Nova Scotia which, though producing bigger crops each succeeding year, are all the while becoming richer. Growing things makes the farmer and the country richer and yet conserves the future. Hence every provident nation encourages its people to "grow things."

The Growth of 1916—One of The Farmer's Good Years.

"In 1916, the farmers of Nova Scotia grew more hay than was ever grown in the history of the Province. Almost equally heavy was the product of the potato and grain fields and of the gardens, too. Late pastures and the late harvested turnips and similar crops fell somewhat below the standard, but none the less were nearly up to average. Fruit trees, unfortunately, did not yield so bounteously, their total product being about equal to that of 1915, and but little more than one-third the product of the banner year, 1911. There has been a growth, slight it is true, in the numbers of live stock of all kinds, but especially dairy cows. Moreover, the better bred and better fed cow has produced from five to ten per cent. more dairy products than ever before. Summing everything up, things grew and produced well in the year gone by, and the season has passed into history as one of the farmer's good years.

But what of 1917? Then will it be more important than ever that farmers "grow things." Everybody, whether living in town or country, is concerned in this. To the Province as a whole it will mean the addition of real wealth. To the grower, the farmer, it will mean personal gain in the making of which he will be rendering the most patriotic service he can render his King and country. But how shall he do it, and what shall he grow?

Sacrifice to "Grow Things" and Help Win the War.

"To start with, there must and there will be left on the farms, no matter how strenuous the war, a big force of men and women, too, whose

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

MAY 8, 1917.

DATES OF ISSUE.

PLANTING THE FARM HOME GROUNDS

There are two equipments necessary for every farm home—an equipment for work and an equipment for living. Too often the equipment for work receives much more attention than the equipment for living. We are influenced by our surroundings more than we know or are willing to admit. Children especially are sensitive to these things. Many boys have been driven from the country to the city by the unattractiveness of their homes rather than by the hard work of the farm. The unattractiveness of home surroundings and the lack of common comforts have made many a farmer's boy dislike the farm. Every farmer owes to his family and to himself the best that he can do in the way of equipping the farm home and making the home grounds beautiful in order that the fullest and richest life possible may be enjoyed by all.

The cost of improvement and planting will be one of the first considerations. The first item of improvement, neatness, need cost nothing more than the effort necessary to put things in their right places. Then, if planting is to be done, there should be a plan. This will cost only a little time and study in deciding upon how and where the planting is to be done. Very often the plants and trees required can be mostly, or This is especially true of trees. Many home grounds are planted entirely with native trees and shrubs. These will nearlyalways give better satisfaction than the varieties offered by tree agents. Many of the wild flowers, if given care in the flower border of the home grounds, will thrive and bloom so well that they will hardly be recognized as wild flowers.

Home improvement, therefore, need not take much money, but it does take interest. If the farmer is interested in having a well kept and attractive home and grounds, he will find the little time necessary to accomplish this end.

MAKE THE BOY A PARTNER

Six per cent of the 400 farmers, who were visited in connection with an agricultural survey by the Commission of Conservation in one Ontario county in 1916, were paying members of the family who remained at home, to work on the farm. No farmer was found who had taken the members of the family into action and actual partnership in the farm enterprise. These conditions also obtain in the Maritime Provinces.

It is essential that many of our best boys remain on the farm and help in developing rural life into what it could and should be. Some of our farm boys may be better suited for occupations other than farming, but those who are suited for farming and wish to farm, should be given every encouragement to do so.

Boys of the farm are too often allowed to drift along with very little attention bein paid to them. The boy will be more likely to become a willing worker if his interest is aroused in the business side of his work and he will gain ability to save if he is taught to spend thoughtfully and wisely. These two factors, willingness to work and ability to save, are fundamental for future success. Permit the boy to participate in the practical business transactions of the farm as the conditions allow. Let him do some of the buying and selling. When he has decided that he will be a farmer, the father may be gradually relieved from some of his responsibilities through a partnership management.

CROP ROTATIONS

Crop failures are quite common with some farmers, while their neighbors on adjoining farms have bumper yields every year.

There are reasons for the success of these energetic business-like, progressive farmers. These were fortified against adverse conditions by the employing of reliable methods during the past number of years. Their land is underdrained, crop rotation and suitable cultural methods are employed, stock raising is a main issue, manure is conserved and applied to best advantage, and leguminous crops are grown.

Crop rotations, coupled with judicious cultural methods, are most important.

The following features of crop rotation work would seem to be among the most important factors making toward profitable results:—

(1) Rotations always comprise hoed, cerial and forage crops.

(2) Grain fields are always seeded down with clover, even though it be used only as a fertilizer.

(3) Grass and clover seedings are heavy. Increased crops of hay, and rare failures of a catch have justified the practice.

(4) Hoed crops form a large proportion of every rotation. An attempt to farm a small area without a hoed crop was not successful. Weeds could not readily be kept in check.

(5) No field is left in hay for more than two successive years. Records show that the second first, and that succeeding crops are very likely to be grown at a loss.

(6) Barnyard manure is applied frequently in comparatively small quantities, rather than at long intervals in large quantities.

CLEAN-UP

Throughout Canada the disappearance of the snow reveals accumulations of ashes, garbage and other refuse, which, owing to the covering mantle, are not visible during the winter. For this reason it is necessary that an outdoor clean-up be undertaken, as well as an indoor. To accomplish this wory systematically, the "clean-up week" has been inaugurated, and has proved successful in inducing many municipalities to adopt efficient means to the end.

Preparations should be undertaken at once for this annual event. The people must be educated to a thorough overhauling of their premises, both inside and out. Much useless material, probably the accumulation of years, will be found serving only to harbor dust. This should be either disposed of to those who can use it or destroyed. Fires of apparently unknown origin can frequently be traced to these accumulations in attics or other out-of-the-way storage spaces. Clean them out, and, instead of wondering what to do with them, there will be a feeling of relief that they are gone.

Clean-up the area around the home. Dispose of the ashes, and you will be surprised at the extent of garden you will be able to cultivate from the apparently useless surroundings of the home.

As an encouragement to the people the municipal authorities should do their part. There should be an early start made on street cleaning, and the opening up of outing speces, and provision should be made for the removal of the refuse gathered by householders.

Canada's season for outdoor life is not long, and it should not be shortened by delay in cleaning up and making presentable our gardens, streets and open spaces.

In the Maritime Farmer's home town, every Friday during the month of May is a town clean-up day. Public minded citizens furnish teams and a general renovation is performed.

* * *

Viscount Milner says:—"Of all forms of productive capacity there is none more vital, indispensable and steadying than the application of human industry to the cultivation of the soil. And if there is one point at which order seems beginning to emerge from the present confusion of our political and social aims, it is precisely with regard to this fundamental necessity of making a better use of the greatest of all natural resources."

The use of the auto by farmers has completely changed the rural attitude toward the good roads

ERADICATION OF WEEDS.—GENERAL REMARKS

Different Classes of Weeds.

According to their manner of growth, weeds may be grouped under three heads.

1. **Annual Weeds.**—These complete their whole life-history in one year or less. The seed germinates sometimes in the fall, but more often in spring, the plant grows rapidly, produces flowers, ripens and scatters its seeds, and then dies before winter. Wild Mustard and Wild Oats are annuals.

2. **Biennial Weeds.**—These during the first season of growth produce a tuft of leaves close to the surface of the ground; during the second season a tall stem is produced which bears flowers and ripens seeds, and then the whole plant dies. The life-history is thus comprised inside two years. Biennial Wormwood and Burdock are examples.

3. **Perennial Weeds.**—These produce flowers and seeds, but after ripening the seeds only those parts of the plant above ground die down, while the underground parts live on for many years. Three types of perennial weeds may be distinguished.

(a) **Spot-bound.**—Weeds of this class do not spread readily in the ground beyond the spot where they first take root. Their seeds may, of course, be distributed over a wide area. Examples are Dock and Dandelion.

(b) **Creeping on the surface.**—The parent plant sends out runners in all directions along the surface of the ground, which eventually take root. Examples are Silverweed and Orange Hawkweed.

(c) **Creeping below the surface.**—The parent plant sends out shoots or, in some cases, roots, which travel horizontally at a considerable depth below the surface of the ground. New shoots grow up from these above the surface of the soil and eventually become independent plants. Likewise, a small piece of the underground shoot an inch or two long is capable of producing a new plant. Field Bindweed and Canada Thistle are examples.

How Weeds Spread.

Weeds may gain entrance to the farm, or, if already there, may be dispersed over a wider area in one of the following ways.

(1) **As Impurities in the Seed Sown.**—Most samples of agricultural seeds contain weed seeds in greater or less amount, which are sown with the useful seeds and thus the weeds may, quite unknown to the farmer, gain an entrance on to his land. The seed sown should be absolutely free from weeds of all kinds—a condition of things which is seldom realized.

(2) **By the Agency of Threshing Machines.**—The threshing machine should be thoroughly cleaned before it is allowed to begin operations on the farm.

(3) **In Stable Manure, and Feeding Stuffs.**—Hay and feeding stuffs often contain weed seeds, some of which are liable to find their way into the manure heap and eventually on to the land.

(4) **By the Action of Wind.**—Many seeds, such as those of Dandelion, and Thistle, are furnished with a tuft of hairs which enables them to float in the air for long distances. In other cases the seeds or even the whole plant may be blown over the frozen surface or the snow.

(5) **By the Agency of Animals.**—The seeds or adjacent parts of some plants, such as Blue Bur and Burdock, are provided with hooks by means of which they become attached to the wool of sheep or the clothing of workers on the farm and in this way be carried into fields where formerly they did not exist.

(6) **By Cultivation**—In some plants, especially those with creeping, underground stems, the broken pieces may be carried all over the field by farm implements and thus dispersed over a much wider area than the parent plants originally occupied.

Methods of Destroying Weeds.

(1) **By destroying the Weed Seeds Already in the Soil.**—Where the ground has been badly polluted with weed seeds through neglect in former years, the surface should be disturbed to a depth of a few inches and the seeds encouraged to germinate either after harvest or in spring. If the land is then plowed deeply the seedling will be buried and the fresh supply of weed seeds brought up should be encouraged to grow in the same manner and should then be destroyed. A hoed crop should be planted and the spaces between the rows ought to be cultivated regularly throughout the season.

When the ground has been badly polluted with weed seeds, some of them may lie dormant for several years and germinate when the soil is again disturbed.

(2) **By Preventing them from Ripening Seeds.**—The formation of seeds can be prevented in various ways, such as mowing several times during the season, or cutting the roots with a hoe or spud, or frequent cultivation of the land by horse labour, or by pasturing the ground closely with sheep. Annuals and biennials will eventually die out if the production of seeds is prevented.

(3) **By Frequent Cultivation and Destruction of the Green Parts as often as they Appear.**—Prevention of seed-formation will serve somewhat to check the spread of perennial plants, but as they can live for many years and even continue to occupy new ground by the growth of underground shoots, etc., some more thorough methods are required to get rid of them. The implements employed for this purpose should be such as will loosen the soil to such an extent that the weeds can be readily pulled out and collected into heaps, after which they should be burnt when dry. It is very important that the underground parts of such weeds as Field Bindweed should not be broken into small pieces difficult to collect and liable to be scattered over a wider area. But, however carefully the work of collecting and burning may be done, some of the weeds are sure to be left in the soil and, if undisturbed, will grow again. Consequently ground that is badly infested with such weeds will require to have the surface disturbed by frequent cultivation. This can only be done if the land is left without a crop, (summer-fallowed) or bears a crop of such a nature that it can be planted in rows with sufficient space between the rows to admit of ready cultivation without injury to the plants. The cultivation should be done sufficiently often to destroy all green parts as quickly as they appear and the implement used should be of such a nature that they will cut all underground stems and roots in the area covered by them without letting any escape. One of the weed-knife type of implements should be used. THE UNDERGROUND PARTS OF A PLANT ARE NOURISHED BY THE GREEN PARTS ABOVE GROUND AND IF THE GREEN STEMS AND LEAVES ARE DESTROYED AS QUICKLY AS THEY APPEAR THE PARTS BELOW THE SURFACE WILL BE STARVED OUT AND THE WHOLE PLANT WILL EVENTUALLY DIE. This is the only way to eradicate finally such weeds as Canada Thistle and Field Bindweed.

(4) **By the Use of Smother Crops.**—A vigorous growth of some other crop such as alfalfa tends to crowd out some kinds of weeds and the cutting of the crop several times during the season prevents the weed from ripening its seeds.

(5) **By Excluding Sunlight.**—This can be done by the use of building paper, or a thick layer of straw or other suitable material and can only be practised on small areas that are entirely overrun by some very trouble some weed.

(6)—**By Spraying with Chemical Solutions.**—The substances most commonly used for killing weeds are Iron sulphate (copperas or green vitriol), Copper sulphate (blue vitriol), Common Salt, and Sodium arsenite. Iron sulphate can be used to destroy Wild Mustard when growing in a grain crop without doing any material damage to the crop. For this purpose a 20 per cent solution is employed and 100 pounds of the sulphate dissolved in 50 gallons of water will spray one acre. Copper sulphate can be used for the same purpose, a 2 per cent solution being employed (10 lbs. in 50 gallons of water per acre). Both these sulphates are poisonous. Sodium arsenite if applied at the rate of 2 pounds to 50 gallons of water will blacken the leaves of Canada Thistle. It is very poisonous and cannot safely be applied to the thistles when growing among hay or other crop as it will damage the useful plants as well.

Common Salt is a useful weed killer to employ in the case of weeds growing on paths or roadsides or waste ground. It should be applied in dry weather at the rate of 125 lbs. in 50 gallons of water per acre. Strong solutions of the other foregoing chemicals may be used for the same purpose.

General Conclusions

The control of weeds on the farm requires in a marked degree the two virtures of thoroughness and perseverance. If a farmer goes about it in a half-hearted way, he will never accomplish their eradication. Constant watchfulness is necessary if progress is to be made. If bare fallow is resorted to, it should be possible to get rid of even the worst weeds in a single year. But the practice of bare fallow is not a paying game. It is in most cases better to graze the land or take off a crop of hay or grain early in the season and then leave the land bare for the rest of the year. Shallow plowing should be followed by continuous cultivation throughout the rest of the season, and a hoed crop planted the following year.

It is safe to say that weeds can only be held in check where a suitable rotation of crops is followed. Where the same land is sown with wheat year after year, or where the land is pastured indefinitely, the weed problem is liable to become worse every year. In the former case bare fallow every few years will be necessary and it is very doubtful whether the return from the land will be equal to that where rotation of crops is followed.—By John Adams, M.A., Assistant Dominion Botanist.

SMUT

Editor The Maritime Farmer:

Enclosed find $1.00, my subscription to the Maritime Farmer. Please reply through your columns to the following questions:—

In the spring of 1916, I purchased a quantity of seed oats. At harvesting time I noticed a great many stalks of the straw did not carry but a very small number of grains. There were, however, a large number of dark brown or black grain shaped sacks or pods, or masses of a powdery substance that seemed to have taken the place where grain ought to be. This trouble was quite prevalent all over the field in which the purchased seed was used. Fields sown with seed of my own growing was entirely free from this trouble. What is the trouble?. Is it liable to spread to other fields? Is there anything I can do to prevent it?—Subscriber.

Ans.—Your grain is infested with smut. Considering the fact that your fields sown with home grown seed were free from smut, we would judge that when you purchased the seed grain in question, you received with your purchase something besides oats. You evidently bought grain that was infested with smut. The trouble is liable to find its way all through your grain and thus every field you sow in future will be more or less affected and the trouble will very materially increase unless you do something to check it. You can check this trouble and if you are persistent in your work, you can eventually eradicate it by taking a few simple precautions each year.

Every spring we describe the treatment of seed grain to destroy smut in the columns of the Maritime Farmer. Indeed we dealt with this matter at some length in our last issue. However, this is a story that bears repeating at this season of the year, and particularly so this year when every effort must be exerted to produce bumper corps. We trust that the treatment of grain for smut will be generally practiced this year. The method is not expensive and the loss from smut is tremendous. It is a loss that all farmers should protect themselves against.

Treatment of Seed Grain to Destroy Smut

Farmers in general little realize the immense loss that is sustained by the country as well as the individual through the ravages of smut and rusts in grain crops. Many tens of thousands of bushels of oats are lost annually, due to the ravages of smut. This waste can be largely eliminated by proper treatment of the seed. It is claimed by statisticians that $12,000,000 is lost annually by the grain growers of Manitoba, Saskatchewan and Alberta through this channel, and while in the eastern provinces the loss is not so great, it is nevertheless much greater than is generally supposed, although individual farmers here and there are protecting themselves against this great loss, as a rule there is comparatively little effort put forth to overcome the difficulty. It seems almost incredible that intelligent men will allow this leakage in the farm revenue to go on from year to year, when at a small cost of both material and labor they could effectually guard against the intrusion of these parasites.

The fungus spores of the stinking smut of wheat and of the loose smut of oats may be killed by treating the seed grain in the following way: Take a pound of formalin (formaldehyde, 40 per cent.), dissolve it in 50 gallons of water. spread the grain out on the clean floor, and wet it thoroughly with the solution, using about three quarts to a gallon for each bushel of the grain. The work can be done easily and thoroughly if one person shovels the wheat over while another applies the solution with the sprinkling can. Then stack the grain up in a pile or in a long rick, and cover over with carpets and blankets to retain the fumes from the formalin. and allow to remain for two or three hours. Then spread the grain out to dry before seeding. It should not be returned to the same bags unless they have been treated with the solution. as they may contain spores that will again infect the grain. The drill box also should be sprayed with the solution.

Another plan commonly followed by some farmers. is as follows:—

Secure 1 pint of formalin for every 20 to 30 bushels of oats required for seed purposes. Dilute with 42 gals. of water and use a barrel in which the bags of grain may be immersed for 20 minutes. Spread out to dry and

Varieties of Potatoes

By W. W. Hubbard

Purity of variety and trueness to type are two essential characters of marketable potatoes, particularly those for the shipping trade. In spite of the various advantages derived from growing one or two pure varieties, it is surprising how few farmers keep their varieties free from mixtures, or who recognize and endeavour to keep them true to type.

If the Canadian potato grower is to receive the highest returns from his crop, it is necessary to grow the variety or type which the market demands. With few exceptions, the market demands only two varieties.

(1) An early white variety, usually of the Cobbler type, such as Irish Cobbler and Early Eureka. In some cases, the Early Ohio, a pink potato, is asked for.

(2) A late white variety of the Green Mountain type, such as Green Mountain or Delaware. The Rural New Yorker, while not belonging to the Green Mountain group, is quite a favourite on some markets.

It cannot be too strongly recommended that the farmers in any community determine the two varieties which are in most demand and then to raise only these two. If more than one or two varietes are raised, attention is divided, which results sooner or later in a mixed crop.

One of the greatest hindrances to market improvement in our potatoes is the fact that too many varieties are raised. If success is to be attained, we must concentrate on one or two varieties for each locality. By doing this, we eliminate to a large extent, the possibility of mixed varieties.

In deciding on the variety which should be grown in any community, attention should be given to the following qualifications:—quality, yield, market demand and earliness. These are all essential and may be obtained by the careful grower.

Quality:—The general market demands a white mealy potato, of good appearance and flavor, uniform in size and shape and easily cooked.

Yield:—The yielding qualities of any variety varies with the strain. There is no use in raising a potato of good quality unless it gives a profitable yield under favorable conditions, nor is there much satisfaction in securing a large yield if the quality is lacking.

Market:—The average grower who is supplying a particular market, must cater to its demands. If he has no special market, and this is usually the case, then he should select a well known standard variety, avoiding novelties or little known varieties.

Earliness:—In every community there is a limited demand for early potatoes for consumption, until the late crop has been harvested. This is usually a profitable trade. However, the late varieties are usually the largest yielders, and for this reason the average grower should raise only sufficient of the early variety to supply the early market, or for the seed stock trade, the general crop consisting of the late or larger yielding variety.

The varieties which are recognized as standard and which are in more or less in constant demand, are:—

Early Varieties:—Irish Cobbler, Extra Early Eureka, Early Ohio and Early Triumph.

Late Varieties:—Green Mountain or Delaware, Gold Coin, Rural New Yorker, and Empire State, to a limited extent.

The varieties which should receive first consideration in view of the market demand, are Irish Cobbler and Green Mountain.

In order that the potato grower may keep his stock pure and true to type, it is necessary for him to recognize the various family groups, if not the varieties, to which some of our more common commercial varieties belong. This is also necessary because of the constantly increasing number of new varieties and the great number of old varieties which are being offered under the guise of new names, or as improved varieties.

It is realized that the average grower cannot hope to recognize all the varieties since there are several hundreds in existence. However, most of our varieties may be grouped under a few families having fairly definite characters, which can readily be mastered by anyone. The present article does not endeavour to draw fine distinctions, but merely to point out the desirable characters of the different groups. It is further hoped that this article will stimulate a desire to eliminate many poor varieties and to concentrate on the improvement of the best yielders which meet the demand of the market. It is further recognized that all varieties do not thrive equally well under all conditions, but sufficient information has been given to enable the grower to recognize the variety which has proven most profitable in his community.

The following descriptions of the leading family groups have been obtained from Bulletin 176 of the United States Department of Agriculture, and from personal observations on varieties grown at the Experimental Station, Fredericton, N. B.

IRISH COBBLER GROUP.

The Irish Cobbler is one of the most popular and most extensively grown of the early varieties. It is a good yielder and has good cooking qualities. There is always a demand for Cobblers for table and seed purposes and for this reason they should be planted by most growers who cater to an early market

Description:—The tubers are short, round or cubical, with blunt sunken ends. The eyes are medium in number, varying from shallow to deep, particularly those in the bud-eye cluster; the skin is smooth and creamy white; the flesh white and mealy.

The vines are medium to above medium in size, with a somewhat spreading habit of growth; the stems dark green, thick, stocky and well branched; the leaves large, flat and of a medium dark green colour; the flowers numerous and large, under normal conditions, of a light purple or rose-lilac, but under intense heat, or towards the dropping period; appear almost white; the sprouts usually of a faint reddish violet or magenta colour, or sometimes almost colourless.

This group may include several varieties, the chief of which are Extra Early Eureka, Early Eureka, Irish Cobbler.

TRIUMPH GROUP.

The Triumph, or sometimes called Bliss Triumph, Red Bliss, Stray Beauty, Red Six Weeks, etc., was at one time a very popular early variety, but is gradually being replaced by the early white varieties. At present it is little grown except for special markets such as the seed trade of Bermuda and some of the Southern States. It would be inadvisable for Canadian farmers to grow it, unless in touch with a reliable market, as the yield is usually low owing to its susceptibility to disease.

Description:—The tubers are short, round or cubical, with blunt ends similar to the Cobbler; the eyes medium in number and depth; the skin usually considered a solid red, but in some strains, (White Triumph) a creamy white. Other varieties are white, with pink eyes, or splashed with a reddish pink; the flesh a creamy white; the sprouts usually more or less deeply diffused with a reddish violet colour.

The vines are dwarfed and fairly compact; the stems short, thick and dark green in colour; the leaves large and dark green; the flowers purple or rose lilac.

The most important variety of this group is the Bliss Triumph.

EARLY OHIO GROUP.

The Early Ohio possibly comes next to the Irish Cobbler in popularity as an early variety. It is usually a lower yielder, but is superior to the Cobbler in shape and uniformity. It is smooth and has good cooking qualities.

Description:—The tubers are round-oblong, with full round seed and stem ends, tapering but very slightly towards the ends; the eyes distict but shallow, sometimes protuberant; the skin light pink, but of a deeper pink around the eyes and seed end, numerous lenticils give the skin a dotted appearance.

The vines are of medium height, the stems stout, erect and dark green; the leaves medium to large; the flowers numerous and white; the sprouts short, much enlarged at the base and varying from a carmine-violet to a violet-lilac or magenta-lilac colour.

GREEN MOUNTAIN GROUP.

This is possibly the most popular variety for the general crop. However, the Rural New Yorker is a close competitor and possibly for some sections, the Rural may be considered superior. The Green Mountain or Delaware, when true to type, is a high yielder, of good market and cooking qualities, and is recognized as a standard variety throughout America. There is always a market demand for Green Mountains.

There are several varieties in this group which are of almost equal importance, but the Green Mountain and Delaware are the most popular important and should be grown in preference to the others. The other varieties of lesser importance and demand are:—Carman No. 1, Gold Coin, Norcross and Snow.

Description:—The tubers are square-oblong and slightly flattened, ends (especially the stem) blunt, thickness and width carried uniformly from stem end to seed end, the eyes medium in number, rather shallow, with strong bud-eye cluster; the skin dull creamy white, more or less netted, frequently with russet coloured splashes towards the seed end.

The vines are large, strong and well branched, stem green, upright at first, later assuming a more spreading habit towards the end of the season; the leaves medium size, smooth and of a medium green colour, not so dark as either the Cobbler or Rural groups; the flowers white and abundant; the sprouts white, short and stubby.

RURAL GROUP.

The Rural New Yorker is a very popular variety in many parts of America, particularly in the northern sections. It is a vigorous, strong, disease resistant variety, and its oval flattened shape is considered by many to be the ideal shape. The vines and tubers are apparently somewhat resistant to Late Blight.

Where the Green Mountain is not acceptable as the standard variety, the Rural New Yorker should receive next choice.

Description:—The tubers are oval and flattened (more flattened on the under side) to broadly rounded flattened; eyes few, very shallow, eye cluster strong and frequently depressed skin creamy white and occasionnally netted.

The vines are medium large, primary stem upright, long jointed and rather sparsely covered with foliage; later branches more or less decumbent, giving the plant a straggly appearance; stems strong and more or less

NO PRICE CHANGES

We believe this is a good year for the fence user to buy fencing. From present indications wire will be so scarce as to be hard to obtain at any price. This condition may hold for several seasons. The wise man is buying liberally now. He is getting his fence at a reasonable price and also having the use of it to help him raise more and better crops while prices are high. At the same time he is performing a patriotic duty in helping to supply the nation with the food it so much needs.

Make Money this year from your "Sugar Bush"

Hundreds of farmers to-day make more profit from their "SUGAR BUSH," with less time and labor, than they do from any other crop on the farm.

The demand for Maple Syrup and Sugar is greater than the supply, therefore, prices are good and there is always a ready market.

If you have Maple Trees on your farm which you are not tapping, you are losing good money. Maple Trees always produce a fair crop. They need no care of any kind, yet, each year produce more, and are tapped at a season when you cannot do other kind of work.

WRITE TO-DAY, and let us tell you how to make the most out of your Maple Trees with the least time and effort.

Advertise int he Farmer

distinctly streaked with dark purple; leaves rather small, dark green, more or less rugose or crumpled and leathery to touch. Flowers medium, abundant and of fair size; the central portion of the corolla is a deep purple which gradually shades into a lighter colour towards the edge. The colour is practically absent on the upper side of the five points of the corolla. Sprouts short, base enlarged, dull white; leaf scales and tips medium to deep purple, or pansy violet.

BURBANK GROUP.

This group while not popular and very little grown in Canada, is very attractive when properly selected. Its long round shape should make it an easy cooker and particularly suitable for baking. However, the present market demands are usually for potatoes of the Green Mountain or Rural type, and consequently it cannot be recommended.

There are two types, one with a russet skin and the other with a white, or dull white skin.

Description:—The tubers are long, oylindrical or only slightly flattened, slightly rounded or tapering at the ends; eyes numerous and well distributed, rather shallow, occasionally protuberant, skin in one section or type, white to dull white, smooth to glistening; in the other, white russetted and heavily netted.

The vines are bushy and medium large, stems light to medium green, branched and spreading; leaves abundant, medium in size and medium dark green colour; flowers white; sprouts creamy white or faintly tinged with magenta.

GROW THINGS.

(Continued from page 425)

opportunity it will be to render patriotic service by doing their level best to "grow things". Old men, who in times of peace would be enjoying their well earned rest, will contribute something to make up for the absence of young, virile men at the battle front. Boys at a younger age than usual will have their labor requisitioned, And women, too, like their sisters. of Great. Britain and other countries in the war zone, will, to a greater extent than ever, contribute directly and indirectly to the industry of the farm. It means sacrifice, but war times are times of sacrifice, and the farming community will not take second place to any in its willingness to sacrifice if that will help to win the war.

Better Methods of "Growing Things" Must Be Adopted.

"Despite all this, laborers are sure to be scarce and hence, if anything can be done to minimize the amount of labor in proportion of production, it should be done. Therefore, the winter months should see all the planning done, the seed secured, the fertilizer purchased, machinery put in shape, and everything made ready for a start in the Spring. Nor must it be forgotten that the securing of high quality seed will of itself make an equal amount of labor from 10 per cent. more productive than if common seed is sown; that high grade fertilizer will give bigger and cheaper returns than low grade, supposed to be cheaper fertilizer; that implements ready for work and horses in good fettle will save hours and days when the spring rush is on.

Increase all the Crops What Things Shall be Grown?

"What shall he grow? If it had only been another acre of potatoes, says the farmer of 1916—who made such big returns at the high prevailing prices from his small acreage. If it had only been oats, says another who learns that oats are creeping up to the one dollar per bushel mark; if it had only been eggs or butter, or wool or lamb or any of those live stock products, say hosts who are getting unheard of prices for these products; if it had only been fruit, says the grower of the Annapolis Valley who can hardly even yet believe the big prices of 1916.

In a way, the question is not hard to settle. If everyone devoted his whole attention to potatoes in 1917, there would surely be a glut and unprofitable prices when harvesting time arrives. Nevertheless, it will pay to increase the acreage of this crop, in which connection it is to be earnestly hoped that farmers will not be tempted by present prices to part with the necessary quantity of high-quality potatoes for their next year's seed. The same reasoning applies to almost every crop that is grown on the farm. But the wise man is the one who, while varying a bit in the direction of what appears to be the most profitable crop, will try to increase all his crops, and especially those that will enable him to feed his live stock at a minimum expendiure for high-priced mill feeds. An extra acre of oats, a half acre more turnips or mangles, another acre of corn, where it can be grown for silage, or in the greater part of the Province, that O. P. V. ensilage mixture (oats, peas and vetches), which has been grown so successfully at the College, will pay in terms of beef, and butter, and lamb, and wool, and eggs, and increasingly fertile fields.

Prospects for "Growing Things" in 1917 Are Excellent.

"Records show that the open fall has provided a chance for at least the usual amount of fall plowing. If even that amount were to get a bit more harrowing or other cultivation in the spring it will grow bigger crops than ordinarily. Those who, by reason of the high prices of 1916, have netted a bit more money, can surely buy an extra ton of fertilizer, which if secured in time, will cost little if any more than in 1916. Nor should purchasing of seed and fertilizer be delayed too long, for farmers will discover, as business men already have, that traffic is so congested that goods cannot be delivered as promptly as in years gone by. In addition to all these things, if the spring is reasonably favorable, it is to be hoped that even at that late time more plowing and cultivation than ordinarily planned upon will be done.

Shall the Fruit Grower "Grow Things"?—The Need of Faith.

"Last Spring, many a fruit grower feared to cultivate and spray his orchard as well as he might have, because of the uncertain outlook for markets. Those who had faith nd a bit of good fortune on their side have made more money from fruit than ever before. We know of adjoining orchards the difference in the product of which was several fold, solely because of the spray that was used, and we have been told of like differences due to fertilization and cultivation. We do not know what 1917 will bring, but the lesson of 1916 to the fruit grower seems to be the need of faith that will compel him to "Grow Things."

The Message of 1916.

And so it goes. There is a limit to the work anyone can do, but if 1916 has left a message to the farmers of Nova Scotia, which should guide them in 1917, it is that they should do their level best to "Grow Things."

Save Fuel & Food

WITH an ENTERPRISE HEAT ECONOMISER on this MONARCH range you have the latest and greatest invention of the age. Based on a scientific principle it saves fuel by saving heat. This one device will save a very large proportion of the first cost of your range in the course of a year.

With the Oven Thermometer and Controller Damper you are able to cook almost automatically which means a great saving in food which is never spoiled when cooked on an Enterprise Monarch.

ENTERPRISE MONARCH STEEL RANGE

DAIRYING.

THE RIPENING OF CREAM

The difficulty of getting the cream ripened to the proper degree is one which is continually present to the butter-maker, and though practical experience is with many the only guide relied on, this is not of much help to those who have not long years of practice behind them to go upon.

The result of some comparative trials recently made will be interesting in this connection. A quantity of cream was taken which had been ripened to show, when heated, .50 per cent. of lactic acid. It gave all the recognized indications of ripening having been reached—that is, velvety appearance, a consistency of fair thickness, and a distinctly sharp flavour.

The percentage method of estimating the acidity by determining the lactic acid present is the most accurate of all, and by adopting it the novice is practically as sure of his result as the experienced hand.

The churning of the milk was effected under varying conditions of temperature, and the results showed a very distinct difference in the buttermilk as regards its fat contents. A high temperature was found to give with this properly-ripened cream butter-milk containing over 1 per cent. of fat. This is in practice much too high, and the cause was found immediately on comparing it with the buttermilk which was got on churning a quantity of same cream at a lower temperature. This was found to contain only .2 per cent. of fat—that is, only one-fifth of the previous amount; and as no other condition had been altered, the effect of temperature alone was thus clearly made evident.

Two other churnings were made with other portions of the same milk at temperatures intermediate to the two extremes above. The buttermilk here showed .35 and .4 per cent. respectively, the difference being accounted for not so much by the temperature as by the fact that the one giving the higher percentage of fat in the buttermilk was churned for five minutes less time than the other.

In the same series of tests, sweet pasteurised cream was also taken containing .2 per cent. of lactic acid, and was churned under similar conditions. The result on the buttermilk was very marked, for it showed slightly over 2 per cent. of fat, this high richness indicating pointedly the necessity of proper ripeness if the full and proper conversion into butter of the fat contained is to be brought about.

If such a state of affairs is allowed to go on in a creamery dealing daily with considerable quantities of cream, the loss of fat in the buttermilk whenever its percentage rises above .2 can be calculated as a definite amount of money, and it will be seen when worked out to be very considerable. If, for example, such a creamery were to deal with 200 gallons of cream daily, the actual cash value of the loss can be simply estimated thus: A percentage of .3 per cent. of fat in the buttermilk means a definite loss of .1 per cent., since by reasonable precautions this could be easily saved from the buttermilk and made to appear as butter. Taking 200 gallons of cream to weigh 2,000 lb., the .1 per cent. loss would be 2 lb., and this at 2s. a pound means that 4s. are thrown away for every 200 gallons of milk churned.

The standard of necessary loss of .2 per cent. taken above is not by any means the lowest possible, for in well-managed creameries this can be and is reduced to .15, or even, under specially skilled handling and management, down to .12. The two essential points which are to be observed in order to avoid any unnecessary loss are the proper ripening of the cream and the temperature. It is now pretty certainly proved that cream is at its best for churning, so far as acidity is concerned, when it shows between .5 and .6 per cent. of lactic acid, as measured by the acidimeter. If this is ensured the ripening can be taken as being at the most satisfactory stage. Under all circumstances the ripening of cream proceeds best at a moderately low temperature. About 68 deg. Fah., which may be used in winter, should never be exceeded.

The best all-round temperature is 60 deg. Fahr. If this be maintained the cream will ripen in one and a half to two days without the use of a starter, or if, say, 3 per cent. starter be added at this temperature the ripening will be completed in from 24 to 30 hours. The time depends also slightly on the amount of cream taken.

A small quantity of cream is found to take somewhat longer than a larger amount, the diminished loss of heat in the latter case tending to hasten the process of fermentation. Thick cream also ripens more slowly than thin, as the presence of the increased quantity of fat tends to retard the opening.

Agrostis.

FEEDING YOUNG COWS

Who has not experienced the discouragements in feeding young calves from the pail? Those stunted, rough-coated, ill-doing creatures often appear to give no response to the feed and care which the average farmer or farmer's wife nds time to give them.

But there is a reason, and this reason is largely because practically no attention is given the calves on the average farm. They are simply fed their milk after it is separated, whether early or late in the day. The first old pail that is handy is used to hold the milk for the calf, and little attention is given to know whether this pail had previously contained sour milk, swill for the pigs, refuse for the hens or any of the other materials carried about the farm stable every day. A calf could scarcely be expected to thrive under such conditions.

One of the best calf-feeders the writer has ever known followed religiously these three rules in feeding his calves:

1. He fed them regularly every meal.
2. He made sure that all utensils were clean and sweet.
3. He always added some material to the milk to replace the butter-fat taken out in skimming or in separating.

An account of this man's experiences and methods will be of interest. They follow:

"As a rule the new born calf is left with its dam only a day. Exceptions are made for badly caked udders, when the calf is left with its mother from two to six days. The cow becomes reconciled sooner to being separated from her off-spring and the calf learns to drink more readily if the two are left together only for a short time. After the calf has had a couple of liberal nursings it is put by itself in a clean, bedded stall, and left to meditate for twenty-four hours. Then we take it a lunch of about four pounds of milk and the calf is willing to learn a new way of feeding.

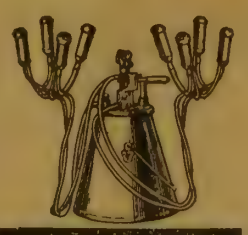
"The best way to get the calf's nose into the milk is to slip your finger into its mouth from beneath its lower jaw. It will then follow your hand into the pail and start operations. From this on the calves must be treated as individuals. Some learn to drink from their first lesson, others have to be coaxed for a couple of days.

"The amount of milk given is increased gradually from three and one-half or four pounds to about six pounds at two weeks old. We weigh each calf's milk separately and try to take it from the same bunch of cows. The milk is also fed as soon as possible after milking. This is not so important when the calvest are older for they will not scour so easily then. At the first trace of scours we cut the calf's feed in half and gradually bring him back to full feed. Holstein milk is fed which does not need diluting. Milk from breeds having a very high percentage of fat might well be diluted with skimmilk from the start.

"At about one month the calves are gradually changed from six pounds of whole milk to seven or eight pounds of skimmilk. They are also given a chance to nibble at some bright mixed hay. Later alfalfa hay is given, when they have stronger stomachs. Grain is also offered at one month. We feed a mixture made up of whole oats, six parts; bran, three parts and one part of oilmeal. Just rub a little on each calf's nose after it has finished drinking the milk and it very soon learns to eat it. One-half pound of this grain is gradually increased to about two pounds at six months. The calves also have free access to water and are given some salt. They are weaned at six months unless we have plenty of skimmilk.

"The care observed in feeding to prevent scours will be of little use if the feed is not given in clean pails.

"I could not have done without it this Summer, as help is so scarce"



Here is the experience of one of the scores of dairy farmers for whom the

EMPIRE
Mechanical Milker

is taking the place of the farm help they can no longer get, and enabling them to keep their herds together and take advantage of the prevailing high prices.

R. R. No. 3, INGERSOLL, ONT.

Gentlemen:—

I have used one of your "Empire Milkers" since early last April, on from 30 to 45 cows continually, and can find no injurious effects on the cows. They seemed to like it from the first time, and I think gave rather more milk than with the best hand milking. Easy cows seemed less inclined to leak, and hard ones gradually became easier.

I have sent the milk a number of years to the Borden Condenser Company, and have had no complaints. I have just followed the instructions for keeping it clean.

I could not not have done without it this summer, as help is so scarce. I may say further that I have been milking cows for over 50 years, and have been in the milk business nearly that length of time. I have had no previous experience with milking machines, but have had very little trouble or expense for repairs. I have used it on heifers never milked before, with perfect satisfaction, no matter how small their teats were.

The Milker has been of more practical value to me than I ever expected.

WILLIAM COLYER.

We will be glad to send you Booklets showing exactly how the Empire Mechanical Milker works, and telling the experience which dozens of prominent dairy farmers have had with it. Address Dept. L

A Wonderful Tonic for Women

A tonic that drives away that distressing feeling of tiredness and nervousness. A tonic that brings strength and vigor—that stops Headaches, Biliousness and attacks of Indigestion—that purifies the blood and clears the complexion of pimples and blotches. This is

Dr. Wilson's HERBINE BITTERS

The best of tonics for women especially because it is prepared of Nature's healing herbs—and used by the women of Canada for more than half a century.

25c. a bottle. Family size, five times as large, $1. At most stores. 26

The Brayley Drug Co., Limited, St. John, N.B.

We wash our calf pails with well water and a brush immediately after feeding, and scald them out in the milk house about twice a week. Nor do we allow any uneaten grain to remain in the feed box but sweep it out clean before each feeding. This is also scrubbed clean if any feed has become moist and decayed.

"If similar precautions are carried out, no one need be afraid to attempt raising calves by hand. They may not have quite the bloom and finish found in calves that run with their dams, but they will be well grown individuals with ability to care for themselves thereafter."

MILK FOR DAIRY CALVES

In feeding the dairy calf, the aim is to cut down the period of whole milk feeding. At the North Dakota Experiment station, two lots of four calves each were fed as follows: Whole milk first three weeks to both lots. From then on, lot A was fed half whole milk and half skim milk till six months old. Lot B, after three weeks old, was fed skim milk with flax seed. Just enough flax was added to supply as much fat at was given the calves in lot A in their whole milk. Each calf was given two gallons of milk a day. The whole milk calves made the best gains the first three months but during the next three months the skim milk calves nearly caught up, the four lacking but 15 pounds of weighing as much as the whole milk calves. Several expert cattlemen who examined the two lots pronounced the calves in lot B in as thrifty a condition as those in lot A. The saving in using skim milk and flax in place of the whole milk amounted to $19 per calf for the six month period. The grain and hay cost the same for both lots.

TRIBUTE TO CREAM GRADING SYSTEM

In a recent issue of "The Chicago Dairy Produce," a strong appeal is made for the introduction of the grading system of paying for cream at American creameries. Referring to Canada's experience the editorial says: "There is one country at the present time that is paying some attention to cream grading and making progress along that line, and that country is in time going to be one of this country's chief competitors in butter production. Canada is the country. Its creameries, dairy commissioners and assistants are working together to bring about a universal system of cream grading. Some of the creameries in Canada that are making the greatest efforts in cream grading are having wonderful success, and the results they are obtaining are passing all their fondest expectations."

PERIOD OF USEFULNESS IN COWS

D. E. G., writes: "At what age does the average cow become useful for breeding and milking purposes?"

The exact age at which any cow becomes useless for breeding and milk production is indeterminate, depending on individual characteristics. In general the period of productive usefulness of cows is reached at 12 years of age. As a rule the milking breeds of cattle become less productive at an earlier period of life than the beer breeds, owing to the greater drain on thei system by the development of milk production lessening their vitality.

FACTS ABOUT DISEASE THAT THREATENS CATTLE INDUSTRY

The annual loss caused by contagious abortion in cattle reaches into millions of dollars. Many breeders dread abortion more thon tuberculosis, and in many sections the loss greatly exceeds that of the dreaded white plague.

The disease is of such insidious character that it may be brought into a herd by an unsuspected animal without attracting attention, as there are no noticeable symptoms. Furthermore, this malady baffles the skill of our best veterinarians. Breeders supposed to be honest in all their dealings may sell affected cows and spread the disease into herds of uninformed beginners.

The laws should be just as stringent on the sale of animals having abortion as those having tuberculosis. Several states and the national government are for appropriations for work in the eradication of abortion, and some of their energies should be directed toward the sale of diseased animals.

I know of herds that have had the disease for over 15 years that still lose as high as one-third of their calf crop. Other herds that have come under my observation have been cleaned up in the course of a year or two.

Contagious abortion is caused by the bacillus abortus. The premature birth seems to be only a symptom. Many cows in diseased herds do not abort, but become shy breeders, taking the bull repeatedly, and some never conceive. Aside from the loss of the calf, the loss by reduced milk flow, failure to breed and retained afterbirth will reduce a profitable herd to one that will be a financial loss to its owner for several years.

The disease is carried in many ways. Probably the easiest way of introducing the trouble into a healthy herd is by an affected cow or bull. A friend of mine suffered 26 abortions in his herd in one winter. The trouble came from his neighbor's diseased bull jumping the fence and serving one of his cows. It may be carried by dogs, cats or birds from a diseased farm to a healthy one. If one is in a diseased territory every precaution should be taken to prevent the introduction of the disease.

There seems to be a difference in the virulence of the bacteria. In some herds it is easily wiped out only after a portion of the herd has aborted, while in other herds the disease persists in spite of all treatment.

Blood tests can be made to show whether an animal carries germs of the disease. This test does not seem to possess a very great degree of accuracy. The claim is made that by this means an affected herd can be tested and those not responding to the test be isolated from the diseased ones.

As a rule, when a number abort in a herd, practically the entire herd will be diseased.

Many methods of treatment have been offered. Several years ago methylene blue was claimed to be a specific. In many herds where the disease existed for years it was found to be a failure.

Carbolic acid is claimed to be a cure, and I know of several herds that were cleaned up by using the acid treatment, although I will not vouch for it as a cure. The treatment consists of giving hyperdermic injections of 10 cubic centimeters of four per cent solution of pure acid every 10 days, or giving two drams crude acid, well diluted, on the feed every other day throughout pregnancy. Many serums are being used with indifferent results. Cows show immunity after one or two abortions, and many of the so-called cures are the result of immunity resulting from abortions.

The most logical method of overcoming the disease that has come under my observation is followed out by a breeder whose herd I have observed very closely. He says: "The sooner the entire herd aborts the quicker I will be able to overcome the disease. I very seldom have a cow that will abort the second time. With careful flushing of the affected cows and sanitary measures I have only one or two that have not afterward got in calf. I also believe that calves from cows that have aborted will be more disease resistant than those from healthy cows." This man had only a few calves last year, while this year every cow is carrying a calf full time.

Every cow is given an antiseptic douche of a ½ per cent. solution of cresol or other standard disinfectants for several weeks after calving and for several weeks before being bred. Those that are hard to get in calf are given the phosphate of soda treatment. An ounce of granular soda to a pint of water is injected into the vagina an hour or two before being bred. No cow is bred for at least two months after calving, and then only after all discharges have ceased for at least a month. Her stable is whitewashed and a good disinfectant used regularly throughout the barn.

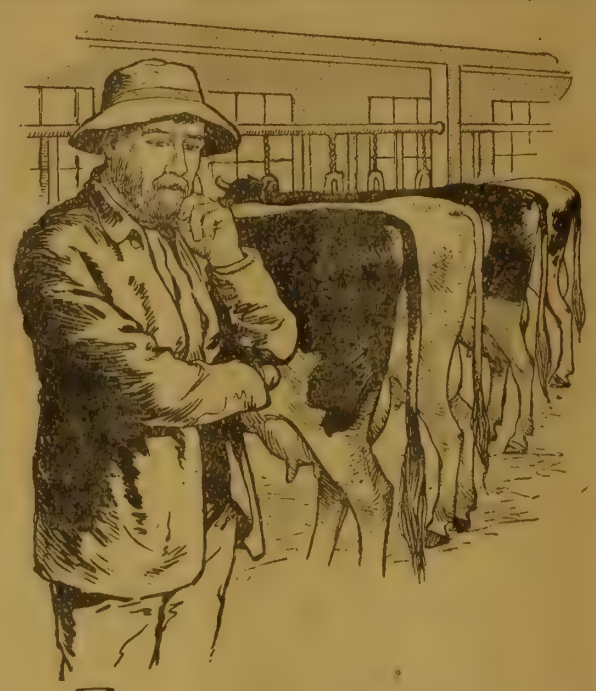
Owing to the cheapness of crude carbolic acid this is fed, but he does put great faith in this. He does not believe in flushing the sheath of the bull after service, as there are many folds that are almost impossible to reach. A large breeder that has had the dicease in his herd for years does not believe that the bull is a great carrier of the disease, as he has sold many bulls into healthy herds that remained healthy. However, if a bull serves badly discharging cows he would become an agent for spreading the disease.

Many commercial remedies are on the market. Great claims are made for them, but most of them do not produce desirable results. The government has been working on a serum to produce immunity. Their experiments have been encouraging. If they succeed in producing a serum that will give the same good results hog cholera and other serums do, contagious abortion will lose its terrors.

Dr. Williams of Cornell has been doing more work combating abortion than perhaps any other man. His treatment is along the line of sanitation, and is finding favor with many breeders and veterinarians.

These are my observations in many herds. There is no certain cure for this scourge. Every cattle owner should strive to prevent the introduction of abortion into his herd. The same care must be taken in buying as is taken in getting tuberculosis free animals.

Once it enters a herd, profits are gone for a number of years, and I would advise the use of the measures recommended by the government over those of unknown merit and great cost. Your experiment station will be glad to advise you fully. Keep the germs of abortion away from your herd. No germs, no abortion.—O. R. F.

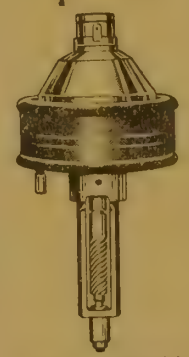


Don't Worry

about the future size of your herd

The capacity of the Standard cream separator is interchangeable. You take no chance on your future separator requirements. If later on you find that you need more cream separator capacity to take care of your larger herd, all you have to do is to replace the bowl and fittings—not the whole machine, if you have the

Standard



Interchangeable Bowl

This bowl and casing lift right out—easy to replace with a larger size.

This important, exclusive feature is certainly a money saver to dairymen and farmers. It costs a great deal less to interchange bowls with the Standard than to exchange the entire machine for a new one. Putting in the new bowl means no loss of efficiency, for the bowl is changed complete. The gearings of all Standard machines are made for 100 pound capacity. Think of the over-capacity advantages you have in 350 to 800 pound Standards!

All you have to do in order to change a 350 pound capacity machine into a 450, 600, 800 or 1000 pound machine is to substitute your bowl for the different capacity bowl and attachments that you require. We accept the used bowl in exchange, less reasonable allowance for wear and tear. So you see you need not worry a minute about the size of machine you buy now.

Other features of the Standard are its low supply can, splash oiling system requiring attention only every three months instead of daily oiling, and its close skimming capacity; the Standard gets all but one-tenth of a pound of cream per 1000 pounds of milk skimmed, while other separators lose half to a whole pound of cream. BUTTER PARCHMENT
Printed or Plain, at the Maritime Farmer Office

TO PRODUCE MORE FOOD FOR THE EMPIRE.

WHAT CAN NEW BRUNSWICK BEST DO

Editor The Maritime Farmer

From the preparations being made the farmers of New Brunswick, evidently intend this season to keep up their potato acreage and by taking good care of their growing crop to have a large surplus of very excellent food material for those who need it, but this is only, so to speak, a minor branch of farm production.

In Nova Scotia the slogan is being raised "GROW A MILLION BUSHELS OF WHEAT FOR 1917". This cry should apply with equal force to the North Shore and Upper St. John River counties of New Brunswick, but there is still another branch where this province can shine.

The hay producing sections of the province are to-day full of unsold hay. Much of it the very best of fodder, but not saleable as market demands go now. There is also every indication, at the present time, for another large hay crop in 1917. This means a surplus of fodder that should be turned to account. There is also a large amount of pasturage which, during late years, has been only partially used.

Therefore, it would seem that the farmers of New Brunswick especially in Westmorland, Albert, Kings, Queens Sunbury, York, Carleton and Victoria, should make every effort to produce meats and dairy products to help out the food shortage.

Let every breeding female be retained, every calf raised, and every ewe lamb kept. In 1914 the Provincial Statistics showed 253,273 cattle, 142,141 sheep and 85,167 swine in the province, while for 1916 there were only 247,609 cattle, 138,883 sheep and 82,847 swine, and yet in 1914 there were only 777,000 tons of hay compared to 850,000 in 1916.

Prices are temptingly high for calves and lambs, it must be admitted, but let us start to increase the supply and not kill the goose that lays the golden egg, for scarcity, world wide scarcity, of meats and dairy products there must be, no matter what we in New Brunswick may do.

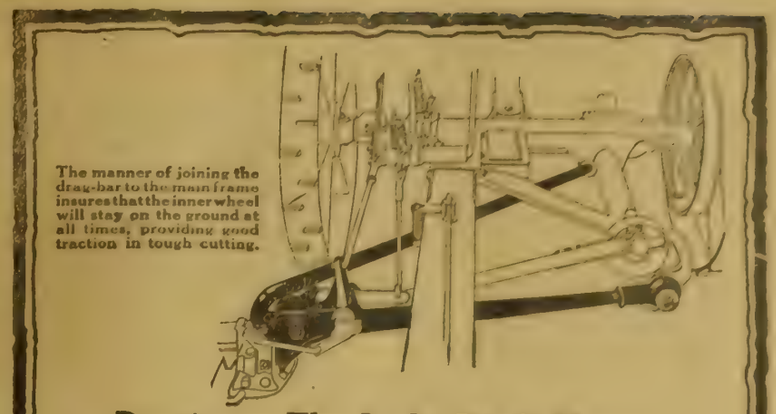
The objection may be raised that we should not encourage the keeping of stock when grains and their products are so scarce, but here let me say that with care cattle and sheep can be grown with very little grain food. With clover hay, young cut and well cured, and an abundance of turnips, beef, milk, mutton and wool can be well and economically made in this Province. With from 10 to 20 pounds of skim milk per day, 100 pounds ground oilcake and 200 pounds of grain, preferably oats, wheat, bran and corn meal mixed, a calf can be started and well fed until it will thrive on pasture or clover hay and turnips. Lambs can be brought up without grain and they will produce wool and when it is desired to make them into mutton, 50 pounds of grain each in addition to hay and roots will finish them into prime carcasses.

Therefore it should be urged,—

1.—That every calf should be reared; males castrated and fed for beef.
2.—That every ewe lamb should be reared and information sent to the Provincial Department of Agriculture as to how many are for sale. Hundreds of farmers want to buy breeding sheep this year.
3.—That all steers of dairy breeds should be sold for beef at a year or eighteen months.
4.—That the Dominion Live Stock Commissioner and the Provincial Department of Agriculture should redouble their efforts to enable every farmer to have the services of the best male animals for the improvement of herds and flocks, and should assist in the placing of stock in those districts where it is especially needed. Prof. J. W. Mitchell, Provincial Live Stock Commissioner, Fredericton, is inviting all who want stock and all who have it for sale to correspond with him.

These, I believe, to be ome of the lessons of the times and the duties of the hour to be observed and acted upon in New Brunswick to-day, if we are to do our part in Winning the War.

W. W. HUBBARD,
Supt. Dom. Exptl. Station,
Fredericton, N. B.



The manner of joining the drag-bar to the main frame insures that the inner wheel will stay on the ground at all times, providing good traction in tough cutting.

Deering—The Light Draft Mower

HAVE you ever noticed the extra long drag-bar of the **Deering** mower, its connection to the frame, and the way it supports the cutter bar? It is one of the exclusive and outstanding good features of the **Deering**, and an important reason why this mower has built up a reputation for light draft and great cutting power.

Through the use of the continuous dragbar, the cutter bar has a flexible movement and floats lightly over even and uneven ground. You can test this by taking hold of the end of the **Deering** cutter bar and noting how easily you can lift it.

The weight of the cutter bar being entirely on the wheels, the traction is increased and the wheels prevented from slipping or being lifted from the ground.

The **Deering** mower has many other good features. You should write for complete description, or better still, examine the mower. Made in the desirable sizes.

Deering rakes, tedders, International side delivery rakes, loaders, and hay presses are machines that save time and labor in the hay field. Write for complete information.

The normal child is of an enquiring turn of mind, and if properly directed, quickly becomes interested in nature, in the common things of the neighbourhood, which are inseparably linked up with life in the country. It is education for the great majority. "Nature is never special, and a knowledge of her laws may form a sound Grecian foundation upon which to build the superstructure of a life as useful to the state, and as satisfying to the inner needs of a man, as if the groundwork were classics and literature. The two, indeed, cannot be separated."—W. R. Reek, B.S.A., in Report, P.E.I. Department of Agriculture.

THE HORSE

EDUCATING THE COLT

Editor The Maritime Farmer:—

Some years ago one of our Canadian Farm Journals gave prizes for the best method of breaking or training young horses to work. The winner of this contest described his method as "Educating" the colt, rather than breaking him, and in detail described his method of handling these youngsters from birth, all of which was wise and proper, if a farmer or breeder could give the time necessary to carry out his full corriculum, that began at weaning and continued almost daily until he reached the age of service.

For the busy farmer this idea is not practical. Few could find time to attempt to carry out his directions. The usual custom is to neglect handling the youngsters until we are forced to put them to work and then the fight is on.

I always considered any man with ordinary "horse sense" should have no difficulty in putting a colt of one of the draft breeds to work. They are usually quite docile animals and not inclined to put up any valient opposition to being hitched; but when we breed colts from Standard or Thoroughbred parents, we should expect these hot blooded, highly intelligent animals to resent rough or ignorant handling. Only a real "horseman" should attempt to break a horse known to be from spirited parents. "Horsemen" like artists are born not made, the former understand horses, are close observers, and a good man can break any colt without having serious trouble if he, with the knowledge of the true horseman, has patience. A quick, passionate man should not attempt to break a young high-spirited colt.

I am satisfied that no horse living would be a balker or kicker if he were properly handled in his youth. In fact, I will wager to break any colt that has not been bridled or spoiled in a few days, and the breaking is not difficult if we go about it the right way.

I don't have time to handle any young horses before working age, much as I know it would be wise to do so. Furthermore, I have no time to loose over them afterwards.

We raise one or two Standard bred colts (or colts of that and Thoroughbred breeding) every year. At present I am using a good mare of rather erratic temperment, which some men would call a bad acter. The fillies from her are high strung and ready to fight at the least provocation; but it does not matter how they are bred, how nervous or high strung they may be or difficult to even handle in the stable, we can easily bring them to reason when we decide to put them to work.

I never attempt to hitch a colt singly, nor even with one horse, although they may be handled that way. After they have worn harness for a half day or so in the stable, we then prepare to hitch them with two well broken horses in a cultivated field to an implement with a seat and operated with a lever, so that the draft can be applied and relieved as necessary. Have the two older horses completely harnessed and everything in readiness to hitch as quickly as possible. Then with an attendant endeavour to get the colt attached to the implement and horses as quickly as possible. This may take some skilful jockeying, but patience must be exercised. Under no circumstances should a colt be struck, as they are otherwise scared enough. This is what we endeavour to overcome, and we can in a short time, with patience and kindness, get the youngster securely hitched. Then cut them clear and let them go. I never attempt to hold them hard enough to risk a stop, but keep going, putting the draft off and on as I think necessary. I take long turns so the traces do not touch them. My idea is to keep the colt going and pulling in the soft ground steadily so as to tire it as quickly as possible. This is generally brought about in an hour or two. Only in bad cases is it necessary to sweat a colt very badly. It is wise to fit the collar with a soft sweat pad to guard against galling, for it is absolutely necessary with some fillies to keep going until they are completely leg-weary.

After they begin to show weariness, I endeavour to teach them to rein and to turn short, letting the traces rub against their legs and handling them. I keep going the first time until they are perfectly docile and it is really surprising how soon they will quiet down. I never let them out of harness until I can handle them alone and unyoke them myself. This may read like a simple and easy method, and it is, but a little harder to carry out by some men than it may appear. Patience, kindness and quickness are necessary, and any good reinsman can break any colt living if it has not been previously spoiled.

I never attempt to hitch a colt the first time alone. In fact, my method is to drive a colt double in a light surry, after being worked on soft land as above described, for the first summer while they are running on grass. We can get a little use out of them in this way and the double work breaks them perfectly.

I have never had a balker or bad acter in any single instance, although I raised three colts from a hot headed mare that never drew anything heavier than a driving carriage or sleigh until she was twelve years old. For this reason I bought her for a trifle, and while her colts inherited her disposition, all of them were in this way, broken to be perfectly mannered mares.

Usually it is not necessary to repeat this sort of team work more than once or twice, but in handling colts it is always better (if you have them) to hitch with two other horses, put them on the outside clear of a pole. Always yoke the colt last and unyoke it first, to avoid accidents. Keep constantly in mind that it is young and liable to unreasonable fright and that horses have remarkable memories. Any little accident or mix-up may teach them some trick they may never forget. I am satisfied that all the foolish little freak tricks that so many driving horses retain to maturity, were taught them by careless or ignorant handling when young.

Many otherwise good carriage and road horses are badly discounted in value by having some of these nasty habits. Every breeder of such horses should take special care to see that they are handled carefully when young. I usually hitch a colt, if well matured and fed at two years of age, and use them occasionally after taking great care that they are not over driven or worked in this way. We can get considerable use of them at an early age and guarantee securing a good mannered, useful horse at maturity

W. M. LEA.

NO HORSE CAN DO HIS BEST WITH BAD FITTING HARNESS

Both for comfort and real good service there is a great deal in having properly fitting harness on work horses. It is quite a simple task to fit a harness properly. I would never tolerate any departure from a reasonably perfect fit for it is often a cause of accidents; besides a harness which is too tight or too loose lessens the working capacity of the horse.

When the bridle is put on the horse consider it critically. Is the browband of the proper length? Most browbands do not fit as they should but are too loose and cause the sensitive ears to be painfully pinched. Blinkers, those abominations to the horse are bad enough when in good condition but carelessly kept they become warped and seriously obstruct the vision. If they flare or the cheek pieces are too loose they lose their effect in the one instance and are dangerous as affording flecting glimpses of following vehicles in the other.

The cheek rein needs most careful adjustment. If the horse is compelled to hold his head too high he loses in power, but to have the check just right gives him a chance to rest his head and neck. Bits are often too wide rather than too narrow. I want the throat latch always to be quite loose.

It is important that the collar fit perfectly. Sore or chafed necks are the outcome of collars which are too much bent at the top. Collars should not be too broad in the tree, especially if the horse has a thin neck or is somewhat thin in flesh and the ridge of the neck suffers unless a housing is worn. They generally fit better when placed well back and the girth does not get a chance to chafe the skin at the elbows.

The breastplates should not be allowed to dangle aimlessly about as they have vitally important duties to perform in handling the load. Backbands should not be too tight as when tight they are inducive to kicking. Tight girting is never necessary. The breeching should hang in the right place and be just tight enough to come into play when the tugs or traces slack.

Very often a mistake is made in adjusting the inside reins on a team. As a rule two horses work better together if they are not worked too closely. The outside rein should be adjusted more tightly than the inside one. Then the horse on the side to which the team is to turn will receive the signal first and his movement in that direction will bring the other horse around without jerking him out of his course. A team drives much more easily and with greater efficiency when the reins are adjusted in this manner.

The neck straps and neck yokes need proper adjustment. The ordinary neck yoke strap that runs through the neck yoke ring in the form of a triangle does not make it possible for the horse to give all of his strength to backing. If possible, straps should be so adjusted to the neck yoke that they will connect directly with the breeching on each side. Thus the horse pulls with two tugs or traces and backs with two straps in the same way.

Not more than half an hour is required to properly adjust the entire harness and when it is once adjusted it need not be re-adjusted as long as it works well and is used only on one horse. No horse can work to his greatest efficiency unless the harness is so adjusted that every movement counts for work.

W. H. UNDERWOOD.

SHOEING OF FARM HORSES

Farm horses are generally all-round-purpose animals, and, for this reason, they must be kept well shod. Some horses demand more frequent shoeing than others, but the average is once every four or five weeks where the animal is constantly on the road. As the shoe protects the part of the hoof which it covers, while the remainder is constantly wearing away, it becomes necessary to remove it occasionally, and, by paring the more rap-

idly growing parts; to bring the different portions into their proper relative positions. If the shoes are allowed to remain on an animal's feet much longer than five weeks without refitting, a deformity of the whole foot may result. Of course where a horse is not worked constantly, it is not necessary to have him shod so often as this. Shoes should never be allowed to remain on a horse after he once begins to limp. Remove the shoes at once and either have them refitted or give the animal a short rest. If a horse can be kept off the road during the summer, remove the shoes and allow the feet to come down to the ground and get the natural frog pressure.

Many farmers throughout the country effect a considerable saving of time and money each year by having a set of horseshoeing tools and doing their own shoeing. Especially during the busy summer months time is often saved if the equipment is at hand for replacing a loose or lost shoe on an animal. It often happens that a horse pulls oc a shoe and must be taken several miles to a shop on the busiest day of the week. With a set of shoeing tools and a little practice any farmer possessing a fair degree of mechanical skill can set the shoe at home in a short time, thereby saving the trip to town. A set of shoeing tools which includes a forge, hammer, pincers, paring knife, rasp and clinch iron can be bought for less than $10. It is best to buy the new shoes and calks at the hardware store and fit them up at home during spare time. A set of blacksmith's tools are also very useful in repairing the farm machinery from time to time. A small portable forge will answer every requirement in doing such work and it takes up but little room in a corner of a shed.

The first step in shoeing a horse is to remove the old shoe or shoes. Cut off the nail clinches close to the hoof with the cutting nippers, then with the pincers grasp the shoe on one side and, holding the foot as securely as possible, wrench the pincers towards the other side of the foot and downward towards the toe at the same time. This will loosen the shoe on one side, then do likewise with the other side and the shoe is off.

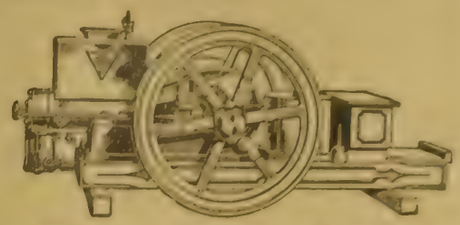
With the cutting nippers now cut off the outgrowing irregularities of the hoof, taking care to trim the hoof least where the shoe shows least wear. This precaution should be exercised at each shoeing in order that the ground level of each hoof may be maintained. Care should be taken not to trim the hoof too deep at the heel. Horses differ widely in form and growth of hoof, but the general rule is to trim off as little of the heel as is necessary to get a good foundation for the shoe, and enough of the toe to maintain the "ground level." To preserve the hoof in a natural and healthy condition should be the standing rule. Paring away the sole is a bad practice which is largely based on error. The sole is not constituted like the hard outer crust or "wall", which grows out indefinitely unless reduced by the shoer's instruments or worn off by contact with the ground.

Having clipped the hoof, take the farrier's knife and smooth down the shoe foundation. Afterward true the bottom of the hoof with the rasp. Care should be taken that all parts of the shoe foundation are in the same place, unless a part of the hoof is tender and must be protected; otherwise the shoe will rock and the nails will work loose.

With the above facts in mind, in regard to trimming the hoof, always fit the shoe to the foot, not the foot to the shoe. Heat the shoe uniformly until nearly red hot, then with the tongs hold it in its future position and fit it until it touches the hoof at all points on its foundation, thus insuring a perfect fit.

"The greatest convenience on the farm"—

that's what farmers who own them say about



Alpha Gas Engines

AND that is what you, too, will say after you have used one and seen how much time and work it saves.

If you want to cut or grind feed, fill a silo, saw wood, or pump water, or if the women folks want to run the cream separator, the churn or a washing machine, the ALPHA is right on hand ready to do the work—and do it more quickly and more cheaply than you can get it done in any other way.

The ALPHA is a powerful, smooth-running engine which will develop its full rated horsepower on a minimum amount of either gasoline or kerosene. The sensitive governor prevents any waste of fuel from changes in load.

The ALPHA has no trouble-making batteries, but starts and runs on a reliable low-speed magneto. It is so simple that a boy or a woman can start and operate it, and this simplicity means low upkeep cost and exceptional freedom from repairs.

You need a good gas engine on your farm. Send for our illustrated engine catalogue, which describes the ALPHA in detail and tells why farmers who use it get the most for their money.

Alpha Gas Engines are made in eleven sizes, 2 to 28 H. P., and each size is furnished in stationary, semi-portable, or portable style, with hopper or tank-cooled cylinder.

The size of shoe required by a horse may be learned from a blacksmith who has formerly shod it. The shoe should be slightly narrower than the hoof to allow for finishing the hoof to the edge of the shoe. It should not be too long, for then it is very apt to be stepped on and torn off. Each farmer should study his horses' feet, examine the hoofs and become acquainted with the sort of shoe that each animal demands. It may be said that, in general, the farm horse should be shod with a moderately heavy shoe, one that will be durable and will protect the feet. But since a heavy shoe is much more likely to come off and be lost, and also because it greatly increases the labor of the horse in traveling, as light a shoe as will fill the requirements, one proportioned to the weight of the animal and the nature of its work, is infinitely preferable to an excessively heavy shoe.

One part of shoeing which usually perplexes the beginner is that of driving the nai ls so they will come out at the proper height on the hoof. The nails must not come out too low, else

POULTRY.

HOW TO RAISE CHICKENS

Thee are several factors which influence the cost of production of chickens regardless of the breed or the variety, and among these are the age of the parent breeding stock, both females and males, the management of the breeding stock, the incubation, the brooding, and the rearing.

First, let us consider the age of the breeding stock. Many people go on the assumption that it is never good business to breed from pullets. But this assumption is incorrect. It is good business to breed from pullets, providing the pullets are mature, that is, providing the pullets mature and get to laying by the middle of November. If such pullets as these are used, they will produce cheaper chickens, because in the first place they will produce more eggs from which to hatch chickens, and this is a big item. Then again, these birds are right in the prime of their youth and are strong, and full of vigor, and will impart these qualities to their chicks, and the hatchability of the eggs and the livability of the chicks will be greater, thus we get a cheaper chicken.

Let us consider now the male. It was formerly thought that a cockerel should seldom or never be used in a breeding pen, but it has been demonstrated with several thousand birds that the cockerels will produce 20 per cent. more chickens than the cock bird, and when we consider these figures, it certainly looks as though the cockerel would produce a cheaper chicken than a cock bird.

In regard to the management of the breeding stock, it might be said that much of the fertility and the hatchability of the eggs depends on how the stock is handled. If the male is allowed to run with too many females, the germs will not be as strong, and while the fertility appears high, yet the hatchability will be low, and this state of affairs is against the production of cheaper chickens. If the breeding stock has become too fat, then of course not as many eggs will be produced as should be, and these eggs will not be as hatchable as they would have been had the stock been kept in good condition, and this is also against the production of cheap chickens.

There is an item of feeding which should be mentioned here, and that is the feeding of wheat. During the past year or more since wheat has been abnormally high, there has been much discussion and many questions asked as to the economy of feeding wheat. It is my opinion that we cannot afford not to feed wheat, and this applies particularly during the breeding season, because if wheat is not fed, I believe that the egg production will not be as great as it would if wheat were fed, and I believe that the eggs will not hatch out as many strong, livable chicks as they would if wheat were fed, and this has quite a bearing on the cost of our chickens.

The next question is the one of incubation. So much depends upon the length of time which eggs can be held and the temperature at which they are held, that it is worthy of mention here. If the eggs are ot held over a week or ten days, and are held in a comparatively moist place and at a temperature below 68 (because the development within the egg begins if the temperature is raised to 68-70), then if other conditions are correct, they will hatch nearly as well as though they were fresh; but not quite as well, so if we are to get the greatest possible hatch from our eggs, they must be incubated as soon as possible after they are laid. The actual incubation itself, of course, has a great influence on the per cent hatched. If the temperature is too low, or if it is too high, or if it varies, then the hatch will be impaired, and when the chicks come out they will have cost us a great deal more than they should.

If the eggs are brooded by the hen, then we must see to it that the hen does not come off her nest too frequently, and that she does not stay off too long; and then again, we must see that she comes off as often as she should (because many hens will sit too closely). If any of the eggs become broken, we must wash the remainder so that they will not be ruined by the contents of the broken egg, being smeared over them. All these factors have a bearing on the per cent hatched, and govern the price of our chickens.

The question of brooding chickens, especially in large numbers, has been greatly simplified by the use of the coal-burning brooders. These brooders will brood from 300-500 (though I think that 300 chicks in one flock is enough), and the brooder is as easy to care for as an old kerosene brooder with a capacity of 50-75, and is much safer. The chicks get a better supply of fresh air, since the circulation under the coal-burning hover is a great deal better than the old kerosene-burning hovers and the very fact that the chicks do get much more fresh air, which is so essential to their life and growth, the mortality is much less, and of course the cost of chick is much less. There is a question of labor in caring for the brooder, and here the coal-burning brooder is far superior to the old kerosene brooders. Because a man can care for one coal burner in the same length of time that is required to care for a kerosene burner, and the capacity is at least five times as great, and the labor cost must be reckoned with when we consider the production of cheaper chickens.

The rearing of the chicks has a great deal to do with the economy of the production. If the chicks are kept growing all the time, they are going to be grown more economically than as if they have stunted periods, and they can be kept growing better if there is a constant supply of dry mash before them all the time much better then they can if they are fed on wet, sloppy foods. If they have plenty of yard room where they can run, where they can search out grubs, bugs, worms, and the like, they will be grown cheaper than if confined closely. If an abundance of shade is furnished them, it will make a great difference in the growth, because the extreme heat of July will sap the life and strength right out of the little chicks, especially those hatched late and not fully feathered. So in order to overcome this extreme heat, we must provide some sort of shade.

One last thing I wish to mention in the production of cheap chickens, and that is the individual himself. If he does not have the mother love for the little chicks, nor a faculty of keeping the loose ends picked up, and does not pay the strictest attention to details, then he will never be able to produce chickens cheaply.

A. W. Richardson,
Poultry Division, U. of M.

FEED CHICKENS WELL FROM TIME THEY ARE HATCHED.

Hatching chicks, either by the use of hens or with incubators, is an easy matter compared with getting them well started toward early maturity. To rear a fair percentage of young chicks one must have a thorough knowledge of the requirements necessary for their growth and development.

During the first week or ten days after they are hatched special precautions must be taken to guard against bowel trouble. Withhold food for the first forty-eight hours and give them no water until a few hours after the first food is given them, but after that time a supply of fresh water should be kept constantly before them. As a general proposition dry feeds are preferable, the feeding of soft mashes prevents the chicks from securing as much exercise as is necessary for their proper growth and development, besides eating soft food too greedily and standing around has a tendency to weaken their digestive organs and powers to resist disease. Young chicks that are fed a mixture of small grains scattered in a litter of cut clover or alfalfa keep busy for two or three hours scratching and hunting for the grain, thus securing the necessary exercise.

Oat meal, cracked kaffir corn, millet and grit are excellent materials to use in the young chick's ration. We feed our chicks twice the first day they receive grain, three times the second day and four times a day after that until they are six weeks old. It is a mistake to feed too heavy rations mornings and noons. The chicks thrive better when they are allowed to become hungry for the evening meal so that they will eat enough to last them until morning. After they begin to scratch in the litter for the grain feeds we substitute cracked corn, whole wheat and buckwheat for the ration fed at the beginning.

Pure fresh water is just as important as clean and wholesome food and should be kept constantly before the chicks after they are three days old. The drinking vessel must be kept clean, for filthy water means sick chicks, and is a prolific source of disease germs that work havoc in the flock.

On the average farm there is little to be gained by hatching the chicks too early. The ideal time for young chicks to come is about April 20. Then by the time they are two weeks old the weather conditions are usually favorable for allowing them to run outside for a short time each sunshiny day. Never allow them to hump up outside and become chilled, but so long as they are running around looking for choice bits of food they will not be injured by the exposure. The run in the open air where they can exercise their instinctive choice of grit and bits of food causes them to eat larger quantities and to assimilate it better. Then too, the chicks that run outside gather green food, and insects too, add to the variety of the rations.

Green food and meat are necessary. No prepared feeds can take the place of the tender bits of grass and small insects. Chicks that run out a few hours each day on a good range have a decided advantage over those that are started earlier and fed succulent vegetables and meat scraps. Of course, these feeds are valuable and must be fed if the chicks are hatched early, or when they are reared on a small lot, but it has been my experience that pullets of the American breeds hatched before the first of May and given proper treatment and plenty of range will be sufficiently developed to begin laying before cold weather comes. The Mediterranean breeds hatched two or three weeks later will be ready for laying late in the fall. When one desires earlier hatches, and has the equipment necessary for successful brooding during the cold weather, it will pay to hatch early chicks, but it is a mistake for the average farmer to attempt to imitate the experienced poultryman, unless he has adequate equipment and a fair knowledge of mechanical brooding. It is not the number of chicks we can hatch out during the proper season so much as it is the number that we can rear and develop into efficient producers before winter comes.

Care must be taken to keep coops, brooders, mother hens and all of the equipment clean. The chicks must be examined closely at short intervals for lice, and if they are found, or there

IF YOU ARE THINKING OF ATTENDING

Fredericton Business College

next term, NOW is the time to send to us for full particulars, which will be supplied on application.

There is a great demand for young men and women to take the places of those who have gone to the firing line. Address:

W. J. OSBORNE, Prin.
FREDERICTON, - - N. B.

Try an Ad in the FARMER

are any signs of their work, the chicks should be greased on top of the head and under the wings with melted lard twice a week until the pests are destroyed. The coops and brooders should be disinfected once a week with crude carbolic acid or some good commercial disinfectant, to keep away disease germs.

W. KELLY,

PRESERVING EGGS.

March, April, May and June are the months when the hens of the country produce about 50 per cent of the lay of the whole year. These are the months, also, when the thrifty housewife, who has her own hens, or who can draw upon the surplus supply of a nearby neighbor, puts away in waterglass, or limewater, eggs for next autumn and winter. To ensure success, care must be exercised in this operation. The following directions are from the United States Department of Agriculture:

In the first place, the eggs must be fresh, preferably not more thn two or three days old. This is the reason why it is much more satisfactory to put away eggs produced in one's own chicken yard.

Infertile eggs are best if they can be obtained; so, after the hatching, exclude roosters from the flock and kill them for table as needed.

The shells must be clean. Washing an egg with a soiled shell lessens its keeping quality. The protective gelatinous covering over the shell is removed by water, and when this is gone, the egg spoils more rapidly.

The shells also must be free from even the tiniest crack. One cracked egg will spoil a large number of sound eggs when packed in waterglass.

Earthenware crocks are good containers. The crocks must be clean and sound. Scald them and let them cool completely before use. A crock holding six gallons will accomodate 18 dozens of eggs and about 22 pints of solution. Too large crocks are not desirable, since they increase the liability of breaking some of the eggs and spoiling the entire batch.

It must be remembered that the eggs on the bottom crack first, and that those in the bottom of the crocks are the last to be removed for use. Eggs can be put up in smaller crocks and the eggs put in the crock first should be used first in the household.

Waterglass Method.

"Waterglass" is known to the chemist as sodium silicate. It can be purchased by the quart from druggists or poultry supply men. It is a pale yellow, odorless, syrupy liquid. It is diluted in the proportion of one part of silicate to nine parts of distilled water, rain water, or other water. In any case, the water should be boiled and then allowed to cool. Half fill the vessel with this solution and place the eggs in it, being careful not to crack them. The eggs can be added a few at a time until the container is filled. Be sure to keep about two inches of waterglass above the eggs. Cover the crock, and place it in the coolest place available from which the crock will not have to be moved. Inspect the crock from time to time, and replace any water that has evaporated with cool boiled water.

How to Use the Preserved Eggs

When the eggs are to be used, remove them as desired, rinse in clean cold water, and use immediately.

Eggs preserved in waterglass can be used for soft boiling or poaching up to November. Before boiling such eggs, prick a tiny hole in the large end of the shell with a needle, to keep them from cracking. They are satisfactory for frying until about December. From that time until the end of the usual storage period—that is, until March—they can be used for omelettes, scrambled eggs, custards, cakes and general cookery. As the eggs age, the white becomes thinner and is harder to beat. The yolk membrane becomes more delicate and it is correspondingly difficult to separate the whites from the yolks. Sometimes the white of the egg is tinged pink after very long keeping in waterglass. This is due, probably, to a little iron which is in the sodium silicate, but which apparently does not injure the egg for food purposes.

Limewater Method.

Limewater is also satisfactory for preserving eggs and is slightly less expensive than waterglass. A solution is made by placing two or three pounds of unslaked lime in five gallons of water, which has been boiled and allowed to cool, and allowing the mixture to stand until the lime settles and the liquid is clear. The eggs should be placed in a clean earthenware jar or other suitable vessel and covered to a depth of two inches with the liquid. Remove the eggs as desired, rinse in clean, cold water, and use immediately.

DUCK GROWER GIVE HINTS.

I find it easier and less expense to raise ducks than chickens, and they do lay nice eggs. They are not bothered with lice or mites and do not get sick. In a small yard inclosed with poultry wire, I can raise 95 per cent. of all ducks hatched. Rats are the only thing that has killed any of mine. As soon as I found out how well the rats liked the young ducks, I fixed my roosting coops so they could not get in. Take four planks a foot wide of any length and fasten them securely at corners, making a door in one side. Then cover both top and bottom with fine wire netting, but do not cover with boards. In bad weather I throw an old sack over one end.

I feed a mixture of one cup corn meal, one cottonseed meal and three wheat bran, moistened with water. Then I sprinkle sand over the top. They like this and grow well. I feed the same to laying ducks. For the first two weeks I do not let the little ducks get in the water, but after this I give them deeper water. They do not need water for swimming. Keep plenty of sand around their drinking place, and have water deep enough to dip their heads under, as they sometimes get food in their eyes. For this reason I do not give milk to drink.

If there is no grass in their runs, cut up lettuce leaves and onion tops in their food. If they are without water all night, they will drink too much in the morning and have "colic" unless you give food first. Always let them have water to wash down the food.

I begin to set eggs in March and continue until July. They do not hatch so well after the weather gets hot and dry. The eggs need to be wiped off with a warm, damp cloth every other day for the last two weeks of incubation. It takes four weeks for them to hatch.

A WAR MEASURE.

Poultry keeping at all times is a pleasant and profitable industry. Just now it might be looked upon as something more—a patriotic duty—a war measure. More eggs are required by the Motherland. While she is compelled to exclude some imports for a time, she welcomes eggs. Poultry pays. In spite of high prices, eggs are a necessity. Larger flocks and increased production could be brought about without undue expense. Poultry keeping is an industry that can be carried on with the lighter kind of labour. It can be made a success when only the older people or the younger members of the family are available for the work. Poultry thrives in every climate under almost any condition; little expense is required to start; returns come quickly, and every month should see some cash receipts.

In all probability there are not as many breeding hens in Canada this spring as there were a year ago. Because of the high price of feed, too many layers and breeders were sold last fall. For the same reason, many hens are not in prime laying condition this spring. To meet the situation as many eggs as possible should be hatched. Every breeder who has good fertile eggs for sale should make an effort to place them in the hands of those who will have them hatched rather than send them to market.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

MAY

By Alexander MLauchlan

The cataract's horn
Has awakened the morn,
Her tresses are dripping with dew;
Oh, hush thee and hark!
'Tis her herald the lark
That is singing afar in the blue:
Its happy heart's rushing,
In strains mildly gushing,
That reach to the revelling earth,
And sink through the deeps
Of the soul, till it leaps
Into raptures far deeper than mirth.

All Nature's in keeping,
The live streams are leaping,
And laughing in gladness along;
The great hills are heaving,
The dark clouds are leaving,
The valleys have burst into song.
We'll range through the dells
Of the bonnie blue-bells,
And sing with the streams on their way;
We'll lie in the shades
Of the flower-covered glades,
And hear what the primroses say.

Oh, crown me with flowers
'Neath the green spreading bowers,
With the gems and the jewels May brings;
In the light of her eyes,
And the depth of her dyes,
We'll smile at the purple of kings!
We'll throw off our years,
With their sorrows and tears,
And time will not number the hours
We'll spend in the woods,
Where no sorrow intrudes,
With the streams, and the birds, and the flowers.

Had Fourteen Fits In One Afternoon

BUT IS MADE WELL AND STRONG BY DODD'S KIDNEY PILLS

Mr. R. J. Thompson, of Uxbridge, Tells the Story of His Terrible Trouble and Almost Miraculous Cure.

Uxbridge, Ont., May 7th, (Special.)—Mr. R. J. Thompson, living near here, had fourteen convulsions in one afternoon. The doctors did not think he could live. To-day he is well and strong. He says Dodd's Kidney Pills did it. But let him tell his own story:

"I am delighted with Dodd's Kidney Pills," Mr. Thompson states. "I have only taken eleven boxes and I feel like myself again.

"I was taken ill very suddenly. I ate my dinner and went to take a man home. I just got about three-quarters of a mile when I was taken with a convulsion fit. I had fourteen that afternoon and the third day I had nine more.

"The doctors said I could not live and if I did I would never be able to do anything again as I had hronic Bright's Disease. But, thank God, I am doing my own work once again, by the use of Dodd's Kidney Pills."

Bright's Disease is the most advanced stage of kidney disease. It can be avoided if the earlier stages of kidney trouble are remedied by the use of Dodd's Kidney Pills.

SAMPLE PROGRAMMES FOR WOMEN'S INSTITUTES

June—Roll Call. Membership fee for ensuing year paid to the secretary-treasurer.

Address by President.

Secretary's Report.

Anniversary Tea.

July—Roll Call. One way I have benefited by last year's Institute meetings.

"Health and good humor are to the human body like sunshine to vegetation."

Paper: Health Hints for Summer.

August—Roll Call. Ways to Entertain Children.

"Association molds the Character."

Paper: Children's Environments.

Final arrangements for Vegetable Fair in September.

September—Roll Call. An Economy for War Time.

"Women are the books, the arts, the academies, that show, contain and nourish all the world."

Paper: Women's Responsibilities of To-day.

Winners of prizes for best grown vegetables at Fair announced and prizes awarded.

October—Roll Call. One of New Brunswick's manufactures.

"Know most of the rooms of thy native country,
Before thou goest over the threshold thereof."

Paper: The Beauties of Our Province.

November—Roll Call. One way to Conserve Our Strength.

"Evening meditation is less important than morning preparation.
Well begun, is half done."

OUR CHILDREN'S TABLE MANNERS

Table manners, like most of the conventions are not arbitrary rule they are based upon common sense. Back of every branch of table etiquette lies either a practical or an esthetic objection. A cup with a spoon left in it is apt to tip over. Biting one's bread instead of breaking it is suggestive of animals and therefore not pleasant to see.

How many parents teach the children not to smack their lips, not to lean their elbows on the table, not to be noisy at meals, and let table manners go at that. And when those children grow up, they learn the conventions at the cost of painful embarrassment and agonized self-consciousness.

A child of two is not too young to acquire the first principles of table etiquete. Explain to him the common sense of everything he must and must not do, and if, for one reason or another you allow him to break the rule, be sure that he understands what the proper thing really is.

All our teaching will be of no avail if we do not set him a good example. Grown-ups fall too easily into careless habits, secure in their knowledge that they know how to eat when they "go out!" But the youngster carries his bad home habits with him.

There are children who seem absolutely incapable of keeping their fronts clean, without the aid of a napkin ticked in the collar or tied around the neck. If such be the case the mother is only courting trouble if she insists that he spread the napkin in his lap. Tell him that he must wear it "baby fashion" until he has learned not to spill his food; as soon as he can eat nicely, he may spread the napkin, folded once, on his lap, in the proper grown-up way. This furnishes him an incentive for good manners.

Children fall into the habit of cutting up their meat into small pieces before beginning to eat, because, when they are very small, this is done for them by their parents. But as soon as a child can manage his knife, let him learn to cut off only one piece at a time, "as mother and father do." It will save him embarrassment in later years.

In the same way, a child learns to butter a whole slice of bread and bite into it. When mother stops buttering it for him, he imitates her method. Bread should be broken, not bitten off, into mouthfuls, each morsel buttered separately. This is not difficult for children to learn. It is based on good sense—for a bite into a buttered slice is likely to leave greasy traces around the mouth.

In a large family of children, where there is much passing of plates for a "second help" from one to another, it is often the better part of valor to allow the owner of the plate to hold his knife and fork in his hand. A wise mother, however, will begin early to teach youngsters that the proper way is to leave the knife and fork resting on the plate, for well mannered people can supposedly pass the plate without accident. Let the kiddies look upon this, and other points, as a grown up privilege to which they may aspire, and they will need little urging to do their best.

When a knife or fork is not in use, it should rest wholly on the plate. At the end of the meal the knife and fork should be placed together, the ends touching on the plate, but not crossed.

The child should not be allowed to leave the spoon in his cup, for this is a bad habit easy to acquire. Remember that everything you can drill into him now will save him future embarrassment. If for lack of patience, you have failed to teach him good manners. Be sure that he will blame you at some later date.

Eating soup noiselessly is easier when the liquid is taken from the side of the spoon than when sipped from the end. Also, it is not good manners to place the whole spoon in the mouth, which the child is likely to do when eating from the tip.

A child should learn not to pat his food, or to move it about unnecessarily on the plate, for this is also a difficult habit to break, and one annoying to others at the table.

"I DON'T SUFFER ANY MORE"

"Feel Like a New Person," says Mrs. Hamilton.

New Castle, Ind.—"From the time I was eleven years old until I was seventeen I suffered each month so I had to be in bed. I had headache, backache and such pains I would cramp double every month. I did not know what it was to be easy a minute. My health was all run down and the doctors did not do me any good. A neighbor told my mother about Lydia E. Pinkham's Vegetable Compound and I took it, and now I feel like a new person. I don't suffer any more and I am regular every month."—Mrs. HAZEL HAMILTON, 822 South 15th St.

When a remedy has lived for forty years, steadily growing in popularity and influence, and thousands upon thousands of women declare they owe their health to it, is it not reasonable to believe that it is an article of great merit?

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential), Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

At many tables, chicken bones, chops, etc., are taken up in the hands. This is quite permissable at a family meal, but it is well to train the youngsters into asking permission to "take it up in my hands" so that he may regard it as the exception, not the rule.

A child should learn to cut lettuce with his fork, without aid of his knife. He should learn not to scrape the bottom of a cup, not to clash his spoon or fork against a plate in an effort to clean up every vestige of some favorite dish. If he must use a "pusher", let it be a piece of bread, not his fingers. He should avoid the habit of suspending a fork or spoonful in mid air while he talks. When food is taken from the plate it should be carried directly to the mouth. At the close of the meal he should fold his napkin and ask to be excused.—The Woman's Magazine.

WAR TIME RECIPES

Left Overs

Every household at some time has remaining from the usual meals, portions of fruits, vegetables, fish, meat, bread, cake, etc., which if wisely used serve to decrease the cost of living, from such odd bits may be made scallops, salads, soups, desserts, etc.

We should each one learn to combine acceptably whatever material we have on hand, taking care to make the dish look attractive. Skill in using up left overs provides many a dainty and saves many a dollar.

The following recipes were used at the Women's Institute Home Economics Courses.

Cream of Pea Soup.—Liquid from one can of peas. 1 small onion.

Cook liquid and onion. Melt 2 tbsp. butter, add 1½ tbsp. flour, salt and pepper. Add liquid to this, cook. Before serving add 1 pt. of scalded milk and a shake of celery salt.

Mulligatawny Hash.—2 medium onions, 3 eggs, 4 tbsp. butter, 6 or 8 potatoes, salt and pepper.

Fry onions in butter, add eggs and seasonings, cook, add sliced potato. Heat thoroughly. Serve as a main supper dish.

Potato and Cheese Scallop.—2 c. riced potatoes, cayenne, 1-3 c. grated cheese, few gratings nutmeg, 2 tbsp. butter, ½ c. milk, salt, 1 egg.

Mix potatoes, cheese and butter and beat until smooth; add seasonings, milk and egg. Place in scallop, cover with crumbs and bake.

Potato Puffs.—Season 2 c. potatoes with salt, pepper, celery salt. Add beaten yolk of one egg and milk, so as to roll on floured board. Roll ¼ inch thick, cut in squares. Place 1 tbsp. well seasoned, chopped cold meat on each square, fold and press edges together. Fry in deep or shallow fat.

Baked Meat and Potatoes.—Melt 1 tbsp. butter, add 1 tbsp. onion and 1 tbsp. flour, mix well, add 2-3 c. milk or water. Season with salt and pepper and allow to heat, then add 1 c. cold meat finely chopped. Heat thoroughly and turn into well buttered baking dish. Spread hot or cold cooked potatoes over it and cook for 15 or 20 min. until potatoes are brown.

Casserole of Rice and Meat.—2 c. chopped, cooked meat, 1 tbsp. parsley, 1 tsp. salt, 1 egg, pepper, ¼ c. fine bread crumbs, 1 tsp. onion, 4 c. cooked rice.

Season the meat, mix with crumbs and beaten egg and add enough meat stock or boiling water to make mixture pack easily. Line a greased mould with 3 c. cooked rice, fill with meat, cover with the remainder of rice, cover tightly and steam 45 min. Serve with tomato sauce.

Fish Loaf.—2 c. cold flaked fish, 2 eggs, seasonings to taste, (curry pepper, Worcestershire sauce), 1 c. soft bread crumbs.

Add crumbs to fish, stir in eggs and seasonings. Place in greased mould and steam 30 min. Serve with sauce.

Chocolate Oatmeal Pudding.—1½ c. oatmeal, cooked, 1-3 c. sugar, 2 c. scalded milk, salt, 1 egg, 2 tbsp. cocoa, 1 tsp. vanilla.

Beat egg, add sugar, cocoa and salt mixed. Add scalded milk to this, then oatmeal and flavoring. Turn into buttered pudding dish, place in pan

A New Dress For Your Home

Cover the scars of wear and tear on walls and floors and furniture.

A wall re-tinted—a floor varnished—a hall painted—a chair or dining room set re-stained—the whole house made fresh and bright, spic and span. There are

SPIC AND SPAN FINISHES

for every surface—for everything you want to "do over":

"NEU-TONE"—the washable sanitary, soft tone Wall Finish, in pleasing tints.
"WOOD-LAC" Stains make soft wood look like expensive Mahogany, Walnut, etc.
"MARBLE-ITE" Floor Varnish—for hardwood floors. Won't mar or turn white.
"LIQUID WAX"—for floors. Easily applied, Dries hard, Shines easily.
"SENOUR'S FLOOR PAINT"—the hard-drying paint for the floor that wears, and wears, and wears.
"VARNOLEUM" brightens up and protects Oil Cloth and Linoleum.

These Finishes have proved their worth and wear and economy in a great many homes. We have handled them for years and can guarantee results

FRUIT JAR LABELS FREE—a handy book of them—printed in colors and ready gummed, given away. Write for them. 104

The MARTIN-SENOUR Co.
LIMITED

The Best Sugar Bought in the Best Way

Royal Acadia Sugar is "Every Grain Pure Cane." The raw product is brought direct from the West Indies to our modern refinery at Halifax

The 100 pound bags offer the best manner of purchasing—best from the point of view of convenience and more economical, especially in these trying war times.

Also obtainable in the following sizes: 2 and 5 pound cartons, 10, 20 and 100 pound bags, half barrels and barrels.

ACADIA SUGAR REFINING CO., Ltd.
Halifax, N. S. - - Canada

of hot water and bake in moderate oven 1 hour. Serve with sugar and cream or butter and sugar.

Chocolate Cream of Wheat.—2 .c. cooked cream of wheat, 1 c. milk, 2 tbsp. cocoa, ¼ c. sugar.

Mix cocoa and sugar, add to milk, when heated add cream of wheat and cook in double boiler until mixture thickens. Mould. Serve with cream.

THINGS ESSENTIAL TO HAPPY HOMES

It is said that home, mother and heaven are the three sweetest words in the English language, and home is placed first for it really embodies both mother and heaven. What is home without a mother and what is heaven but our future home?

In the well organized and happy home there are several things essential. First, there must be harmony. The parents may not always see things alike, for two people seldom do, but each parent must be willing to compromise. If each determines to have his or her way, a discord arises and dissatisfied feelings are the result. The children of the household soon catch the discontented strain and will unconsciously seek a more congenial atmosphere; the father does not find pleasure in remaining with his family in the evenings and the mother loses her influence as the guardian angel.

There must be co-operation. Each member of the family must enter heartily into the plans, the pleasures and troubles of the others. The father must take time to enter into the plans and pastimes of his boys. He must even take part in their games and make their friends his friends, if he wishes to keep their love and respect which is so precious. The sons of such a father will not prefer "the boys" to an evening around the family table.

Many mothers become so absorbed in building the material part of the home that they allow their confiding young daughters to drift entirely away from the influence of the home. Every mother must cultivate the confidence of her daughter. If a girl does not find confidence in her mother she will find it somewhere outside of the home, often to a mother's sorrow. There must be love in every true home. In fact love is the keynote to all the other essentials. The home must be organized and regulated by it.

The literature that enters the home must be carefully watched. There is nothing that so shapes the character and destiny of growing children more than the literature they read. If a parent has to deny the household other things in order to place good reading in his home, he must do so. It is well guided economy.

The amusements of the home must be helpful and refining. If possible there must be music, as there is no amusement more uplifting.

It may be only a humbled little cottage nestled under the trees by the roadside, but if the father and mother are patient, kind, gentle and forgiving it is a sweet home. There is many a stern-faced man today who is battling with a nation's serious problems, but who when he would rest allows his mind to wander back to where a tired but sweet-faced mother sang "In the Sweet Bye and Bye." And in the twilight she taught his baby lips to lisp the words "Now I lay me down to sleep,". then tucked the patchwork quilt gently around him as she knelt by his trundle bed.

FROM ALL FABRICS REMOVING STAINS

To remove stains successfully from all kinds of fabrics without injuring the fabrics themselves, it is necessary to know that animal fibres are readily destroyed by alkalies, while vegetable fibres are attacked by all but the weakest acids, but are not affected by alkalies.

To remove stains from cotton and linen then it is quite safe to use the rather strongly alkaline Javelle water. This is prepared by placing one-pound of washing soda in a porcelain-lined kettle and adding one quart of boiling water. To this add the clear liquid which separates off when one-half pound of chloride of lime is stirred into two quarts of cold water and the mixture allowed to settle. This solution should be bottled and kept in a dark place. To remove stains, dilute the Javelle water with an equal volume of hot water, and soak the stain in the solution until it disappears.

Probably the best reagent for removing stains from silk and wool is three per cent. hydrogen peroxide to which is added four volumes of water and one volume of ammonia. The stain should be soaked in this mixture for a few minutes, then dipped in a ten per cent. solution of sodium bisulphide. If the stain is persistent, it may be necessary to repeat this treatment several times, exposing the fabric to the sun and air between treatments.

Bleaching solutions can be used with white goods only, as any reagent which will remove stains will also remove colors.

RECOGNITION OF A CHILD'S WILL

Mothers, be sure that your child has a will of his own, and is not merely day after day following the dictates of yours. Has he an interest in life all his own, individual, personal to himself, different entirely from the interest that you have; or is he merely a little replica of yourself, thinking as you think, doing as you do or command, never making a choice for himself? Has he strong likes and dislikes of his own, and the strong desire and determination to cling to the thing he believes to be of greater value; or have you so discouraged him in choosing and clinging to his choice that he is ready to give in at your word, or relinquish it at a frown or a warning word from you? Perhaps you think it is a good trait that he is gentle and yielding, that he lets you decide for him, and never opposes his will to your own; but does it not occur to you that later this tendency to yield and to let others think for him may be a danger and a menace to his life? So long as you do his thinking for him, perhaps he is safe, but what about the day when he will yield weakly to the wishes and opinions of others who are perhaps not trustworthy? You will blame him then for having so little will of his own; yet the blame after all will rest upon you who taught him in his early days that it was a virtue to let others think for him, instead of helping him to think and decide earnestly for himself.

One of the most practical ways of developing a well-balanced will in a child is to begin as early as possible to give him a choice, to help him to make a wise choice, and then to help him stick to that choice. He should be taught as early as possible that he is here to be controlled by his elders only until he can learn self-control. He must be taught to think of self-control not as a gloomy thing, but as a joyous thing rather, and the only true freedom; a freedom to which it is his privilege to attain.

THE REPAIRING OF TORN WALL PAPER

House cleaning time brings with it many unthinkable tasks for the housemother. She must make herself into scrub-woman, painter, decorator, etc., but it may become a pleasure to repair even the wall paper. This, we are told, is a simple matter, though we get the impression that we have a difficult task before us, and feel nervous when thinking of what is to be done.. It does look very bad to see the wall paper torn, whether it is little or much. And if this is the case in more than one room, and the rest of the paper is good it would be a great saving to care for it before the place gets beyond care

A professional decorator has said that mending paper may be done with little expense and trouble if done in the right way, and advises this: "A very thin steel knife must be inserted very carefully under the torn part to loosen the entire sheet, or the portion that is to be pasted. The paper and dirt must be scraped off the wall, then the paste is taken from the paper with a soft cloth. The surfaces are then ready for the first coat of paste which is made from three tablespoonfuls of flour stirred smooth in cold water. The boiling water is then added while the flour is being stirred. After this has been allowed to cool it must be applied to both paper and wall and left to stand for ten or fifteen minutes. Apply the second coat to the wall and paper, then press both surfaces together and pat on with a dry, soft cloth. Should air bubbles make an appearance, work them carefully to the edge and you will have a perfectly smooth surface.

CELLARS SHOULD BE KEPT CLEAN

The cellar as a storehouse for canned goods and vegetables should be kept scrupulously clean, as authorities state that disease may occur because of the impure air which gathers in some cellars. The cellar that contains impure odors should be thoroughly aired regularly. The floor should be swept and mopped, and all cobwebs brushed down from the walls and ceiling.

One method of removing odors in a cellar is to fill a bowl with lumps of quicklime, over which a few grains of dry copperas have been scattered. Slack the lime thoroughly, and the steam arising from the mixture will remove bad odors in the cellar. Powdered borax is a good disinfectant to scatter around the floor and corners of a damp cellar. Chloride of lime is an excellent deodorizer, and an inexpensive substance to use for purifying the air in damp, ill-smelling places. Charcoal has great powers of absorption, and a few bags hung up in the cellar will act as a deodorizer and absorb moisture. Powdered slack lime will also prevent the musty and mouldy odors which are prevalent in many damp cellars.

Because of the cellar being out of sight the condition there may become very bad before demanding attention. Such conditions should not be tolerated, especially when the room is used

What Will I Look Like in Ten Years from Now?

What woman hasn't asked herself this question? How often have you worried about it? You have heard it said that "beauty is only skin deep". Don't believe it. The key to good looks is health, and the first essential to good health is to keep the digestive organs in perfect working order. For this purpose nothing is so helpful as Chamberlain's Tablets. An occasional dose will prevent or relieve constipation, indigestion, biliousness, sick headache, and all their train of attendant evils.

DON'T BUY FENCE IN THE DARK!

Know What You Are Getting

WHEN you buy FROST FENCE you have the privilege of going to your dealer and examining the fence before you pay out any good money for it. This method is much more satisfactory to you than ordering by mail, or "buying in the dark."

LOOK FROST FENCE over before you decide to take it—see the rigid manner in which the **Frost Lock** grips the line wires and stays but does not kink or weaken them. You will see that the entire fence is made from full No. 9 gauge wire—evenly and heavily galvanized.

SURELY you will appreciate the value of being able to examine fence thoroughly before buying—this is the **Frost** method of doing business.

COMPLETE fencing supplies—We make all styles of farm fence also lawn fence both iron and wire; gates all styles and sizes; coiled and soft wire; galvanized and bright wire, hay wire, bale ties and staples. Our complete wire output is drawn, galvanized, and made into finished materials in our own wire mills at Hamilton.

as a place for storing food products. A few hours' time can be very profitable used in protecting the food stored in the cellar as it undoubtedly bears a great influence on the general health of the family.

HOW TO REPEL THE CLOTH MOTH.

Most people are familiar with the injury done to woolen fabrics and furs by the cloth moth. This insect does not confine itself to the house-hold pest, but it can also be found in clothing and dry goods stores. The adult is a small buff-colored moth about three-fourths of an inch in length and is harmless, all the depredation being confined to the larvae stage.

The larvae are case-borers and are never seen away from their movable clases. In appearance these cases appear as matted masses of wool having the same general color of the substances from which they are constructed, hence they are somewhat difficult to detect.

The adults appear from July to September and deposit their eggs upon some woolen fabric or furs for the succeeding generation.

Unfortunately, there is no effective method of preventing the damage done by these insects. Consequently in infested quarters frequent inspections are demanded wherever these insects become troublesome. It is generally assumed that the various repellants, such as tobacco, camphor, moth-balls, etc., will free garments of this pest. The above mentioned repellants are useful inasmuch as they will prevent the moth from ovipositing where they are placed, but they do not prevent the developments of eggs or larvae on infested goods. The most effective method for this pest is to thoroughly sun and brush the cloth desired to be laid away. Then place in a tight box or trunk with a goodly supply of one of the above mentioned repellants. This will prevent reinfestation.

TO BRIGHTEN CARPETS AND RUGS

There is nothing that mars the appearance of a living room more than a soiled, faded rug or carpet on the floor, and yet the house-wife does not always feel able financially to replace the old rug or carpet with a new one.

I find a solution made of soap, water, and salts of tarter, which may be secured at any drug store, makes an excellent cleaning agent for soiled carpets or rugs. Shave one-half pound of soap in one quart of water and boil until dissolved. Then add to this mixture one gallon of hot water and one ounce of salts of tartar, and mix thoroughly. Apply the mixture to the carpet or rug with a stiff brush, scrubbing briskly one breadth at a time. When the carpet is scrubbed sufficiently with the solution, wipe it with a cloth wrung out of cold water. If there is much green in the carpet, add one cup of vinegar to the solution and it will preserve the color. This quantity will clean a large carpet.

Rugs and carpets may be freshened by wiping them with a cloth wrung out of warm water, ammonia, and kerosene. Use one teaspoonful of ammonia and one table-spoon of kerosene to one gallon of warm water. Also the colors in rugs and carpets may be brightened by using a solution of alum water. Apply the solution to the carpet or rug with a cloth, and wipe thoroughly. If the colors are faded they may be improved by touching up all faded designs with commercial dye, or a mixture of oil paint and gasoline. Use a small brush when applying the color.—

Senator—Don't you think that the country should spring to arms?

Citizen—Not until it arms to spring.

BRONCHITIS
WAS SO BAD
Coughed Every Few Minutes.
DR. WOOD'S NORWAY PINE SYRUP
CURED HER.

Bronchitis starts with a short, painful, dry cough, accompanied with a rapid wheezing, and a feeling of oppression or tightness through the chest. At first the expectoration is a light color but as the trouble progresses the phlegm arising from the bronchial tubes becomes of a yellowish or greenish color, and is very often of a stringy nature.

Bronchitis should never be neglected. If it is some serious lung trouble will undoubtedly follow.

Get rid of it by using Dr. Wood's Norway Pine Syrup. This well-known remedy has been on the market for the past 25 years.

It cures where others fail.

Mrs. Geo. Lotton, Uxbridge, Ont., writes: "I have had bronchitis so bad I could not lie down at night; and had to cough every few minutes to get my breath. I had a doctor out to see me, but his medicine seemed to do me no good. I sent to the druggist for some good cough mixture, and got Dr. Wood's Norway Pine Syrup. One bottle helped me wonderfully. I stopped coughing, and could lie down, and rest well at night. I cannot praise it too much."

Dr. Wood's Norway Pine Syrup is put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by THE T. MILBURN CO., LIMITED, Toronto, Ont.

TEACH CHILDREN ECONOMICAL HABITS IN CHILDHOOD DAYS

Many centuries ago one who knew and one who had had a wide experience in connection with the problems of life and since that time has been looked upon as the wisest man of all generations said, "Bring up a child in the way he should go and when he is old he will not depart from it." No law or rule that can be broken will hold good in every instance, but that fact does not prove the rule to be wrong; where the contrary is the exception the rule soon becomes established. All educators, institutions of learning, churches and societies unite their evidence in support of the truth of this general rule. The reason is not far to seek. The mind of the child is in that plastic condition which receives impressions easily. It is much like the tender young shoot that in the early days of its growth can be twisted and turned to conform to almost any desired shape, but which soon becomes hardened and impossible of change.

The tendency of the child's mind is to run to extremes. One will go in one direction and another in entirely the opposite; In other words they are not well balanced. Some children are nervous and afraid, others are bold and venturesome even to recklessness; others are timid, modest and quiet, while many are boisterous, coarse and rude; and again there are those who are miserly and selfish while their mates are generous and would give away all they had to others. All of these may be made to conserve useful ends if the training of the child is such that extremes will be guarded against in any direction. This may be done by adopting such practises as are wise and useful and by developing these other undesirable characteristics naturally become weakened and assert themselves only when needed to round out a full and well balanced character.

In the matter of instilling habits of economy into the child's life, great care should be exercised that the other extreme be not reached. It is no more desirable that a child adopt extreme and miserly habits than that they should be somewhat prodigal with their money or even spendthrifts so long as it does not induce vicious habits as the former is likely to dwarf the character and lead to even more contemptuous vices than the latter.

Since as has been noticed the mind of a child is plastic and open to impressions it would seem to be the part of wisdom for parents and guardians of children to put into the hands of a child a little money each week and then teach them the proper use of it.

There are many claims upon the individual and these should be taught to the child. There are the claims of the church, which may or may not include that of charity, benevolent institutions, etc. A part may be allowed for personal use such as clothing, a small amount for spending money and a part laid away regularly for a rainy day. For the latter purpose, no doubt a savings bank account will be the best plan, for this will not only be of real interest to the boy or girl but at the same time will have the effect of educating them in modern business methods which will be useful to them in later experiences.

Just what amount should be put into the hands of a child will depend upon circumstances and the age of the boy or girl. Up to a certain age they will be wholly dependent, but as soon as they are able to earn something they had better be paid for certain services, but not all, as they must realize their duty in the family circle and this must be freely bestowed without money and without price. When this time comes they should undertake the purchase of their own clothing under advice of the parents. Good judgment is greatly needed in the amount allowed a boy or girl for spending money. Supplying either with all they want is a dangerous proceeding and many a one has formed bad habits induced from this cause.

If careful practices are employed in the handling of money by children there seems to be no good reason why the words of wisdom previously quoted should not apply in this particular as well as in any other phase of child education and the development of economical habits proceed along worthy lines without the danger of leading them to extremes in any way that would be undesirable and which would greatly mar their usefulness as Canadian citizens.

FRESH FRAGRANT FLAVORFUL

EQUIPPING BED IN SICK ROOM

The bed in the sick-room should be somewhat higher than the beds in ordinary use, thus, if much treatment has to be administered, saving the backs of the nurses and doctors.

A low bed may be elevated by procuring fro ma carpenter four blocks of wood sufficiently thick to make the bed the required height. The centre of each block should be hollowed. Having removed the casters, place the legs of the bed in the hollows.

The iron-frame bed, three feet wide, six feet six inches long, with high head-and-foot pieces (the latter to be used as a frame in the construction of croup-tents, in making cradles for operative cases, or in arranging for vapor baths), with a woven-wire mattress, on which should be one firm hair mattress, is the bed par excellence for the sick room.

The bed should be so placed as to be easy of access from at least three sides, with the light at the back. The light should be shaded at night by a square of bristol-board, fastened by a cord, so as to completely shield the eyes of the patient. If there is a mirror in the room, see that the patient is not getting a reflection from it.

If available, a quilted protector should be placed over the mattress. Cover this proctector with a large sheet, which should be tightly drawn and tucked well under on every side. Across the middle of the bed place a rubber sheet, one yard in width and long enough to tuck under the mattress. Over the rubber sheet place an old sheet, so folded that the hem comes at the lower edge, and this, too, must be drawn tightly and tucked under on both sides.

Put on the upper sheet, tucking it in well at the foot, being careful to have the wrong side of the hem up and allowing enough extra length to turn well over the blankets, which should be soft and of light weight.

Should the patient sit up while the bed is being made, do not, when it is in readiness for him, toss the upper covering carelessly over the footboard, but fold the sheet and blanket accordion-wise nearly to the foot, or, in the case of an ether patient, quite to one side (the folds in the latter case being lengthwise); then, when the patient is placed in bed, the clothing may be drawn carefully over him.

A weakened patient will not infrequently be bathed in a profuse perspiration after sitting up for a while, and a brisk rubbing, with a warm Turkish towel; will be necessary.

A word about hot-water bottles: Too great stress cannot be laid on the

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

MRS. M. SUMMERS, Box 309
Windsor, Ont.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight aud dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

Windsor, Ontario

necessity for protecting the patient from burns. The bottles should never be placed close to the body of an etherized or helpless patient; and, in any event, they should be well covered and carefully watched.

When the patient is compelled to lie on his back, a large pillow placed under his flexed knees will rest him wonderfully.

When he is turned on his side, very likely his knees will interfert, the one with the other, and a small pillow placed between them will be a comfort.

A pillow of excelsior stuffing makes an excellent support for a patient who is turned on the side, but who lacks the strength to remain in that position unless firmly supported.

While the patient is on the side, seize the opportunity to gently massage hips and back. Use alcohol, as it serves to harden and tone the tissues. Dust such portions freely with powder, and be ever on the watch for a bed-sore; for if one is ever started, it is very difficult to eradicate it.

HOW TO TREAT CORNS, BUNIONS AND OTHER AILMENTS OF THE FEET

One of the first requisites for mother's comfort is to be properly shod. The house shoe should be of soft pliable material with low heels, capped with rubber. Much care must be exercised in the fit of shoes, as shoes too large or too small will either one cause corns. If corns should appear they may be removed by binding on a thin slice of lemon renewing when it begins to dry out; night and morning should suffice. Keep on till the corn can be removed; it may require two or three days' treatment. This remedy often cures a corn and always gives relief.

An old orn and bunion remedy was made by soaking bread crumbs in vinegar and binding on the affected toe. The same remedy is also excellent for frost-bitten feet. Rubbing corns and bunions with old of cedar wood will relieve pain and burning. When bunions are swollen and inflamed an occasional painting with tincture of iodine will alleviate the suffering. Pouring water as hot as can be borne from a height upon bunions will reduce the swelling of the joint. Borax or a generous amount of sea salt in a warm (not hot) foot bath are very beneficial to the feet, after which rub them well with a rough towel, dust well with talcum powder; slip on clean hose and a change of shoes and you will experience a satisfying sense of refreshment.

Feet that perspire exessively will be made more omfortable by adding a half teaspoonful of formalin (formaldehyde) to the foot bath. Do not try to relieve aching or burning feet by bathing in hot water; this makes them tender. Instead bathe them in lukewarm water, then throw cold water over them and rub perfectly dry with a rough towel.

Where one must stand for long periods, rugs will contribute much toward the comfort of the foot. Mother or anyone in fact should never slight the feet of proper care and shoeing, for ill-treated feet cause much discomfort and handicap one of worthwhile efficiency. It is advisable to have several pairs of shoes, as a change of shoes is a wonderful means of rest to tired feet. When the feet are very tired, from long continued standing or long walks, take off the shoes if possible, lie down and elevate the feet on several pillows, so the blood will not rush into them for a few minutes. You will find a few minutes, resting the feet this way, a great help to them.

When one finds that a wrinkle or hole in the stocking is causing discomfort the shoe should be taken off and the cause removed at once, instead of walking around in misery. A few minutes spent in making the feet comfortable will keep frowns away and help keep us cheerful. M. A. K.

"You waste your time painting pictures."

"You are wrong—I sell my pictures."

"Which fact convinces me you can sell anything. Why not take up insurance, or motors, or something with big money in it?"

Best Nerve Specialist in England Was Consulted

Nervous disorders frequently result from injury to the nerves in accidents or because of the shock to the system.

The writer of this letter was corralling a bunch of colts when his horse fell over a barbed-wire fence, and he was carried to the Royal Inland Hospital, Kamloops, B.C., in an unconscious condition, remaining in this state for three weeks.

Not being able to obtain restoration of the internal nerves which control the action of the digestive and other vital organs, he travelled to Europe and consulted England's greatest nerve specialist, Sir Victor Horsley. Relief was only temporary, in spite of many treatments used.

His letter gives the facts briefly, and tells how he was finally cured by using Dr. Chase's Nerve Food. Can you imagine any more severe test of this great nerve restorative ?

Mr. Henry F. Venn, Cefu Ranch, Malakwa, B.C., writes: "Dr. Chase's Nerve Food has restored my nervous system and given me new health. Having met with a severe accident seven years ago, from which I was unconscious, and which left my nerves in a very sore plight, I was treated by doctors galore, and consulted one of the greatest nerve specialists in England, but nothing seemed to do me much good. Hypophosphites and, in fact, all and every kind of nerve mixture in almost every form was used, but never with more than temporary benefit.

"But Dr. Chase's Nerve Food has acted very differently, for it has built up my nervous system until I feel like my old self again. If this medicine will do for others what it has done for me I shall not regret having written this letter. I have recommended the Nerve Food personally to many, and shall always esteem its great restorative value."

50 cents a box, all dealers, or Edmanson, Bates & Co., Ltd., Toronto.

PROPER FOOD FOR YOUNG CHILDREN

Food for children between three and six years of age, says Miss Caroline L. Hunt, scientific assistant of the Office of Home Economics, should be chosen with reference to their bodily needs. A little child who is carefully fed in accordance with his bodily needs receives every day at least one food from each of the following groups:

1. Milk and dishes made chiefly of milk (most important of the group as regards children's diet); meat, fish, poultry, eggs and meat substitutes.
2. Bread and other cereal foods.
3. Butter and other wholesome fats.
4. Vegetables and fruits.
5. Simple sweets.

Milk is the natural food of babies and the most important food for young children. A quart of milk a day is a good allowance for a child. The greater part of this is usually given as a drink or served on cereals or in the form of bread and milk. Milk may also be served on fruits that are not very acid (baked apples or pears, berries, and others), in soups, gravies, custard, junket, and other puddings and may be used in place of water in cooking cereals.

Good whole milk is desirable, but if a mother is obliged to choose between clean milk and rich milk, she had better take the clean milk. Best of all, of course, is clean whole milk, but if that can not be obtained it is better to use clean fresh skim milk than dirty or questionable whole milk. A quart of skim milk, even separator skim milk, contains about a third of a cupful of solid food, which is nearly all there was in the whole milk, except the butter fat. Compared with most other foods milk contains much lime but very little iron, Spinach and other green vegetables and egg yolks are, on the other hand, very rich in iron. This is one reason why combinations of egg yolks and milk and of vegetables and milk are mentioned so often as fit food for children.

Cereal foods of some sort are used by children practically all over the world. Bread is the commonest cereal food in this country, though cereal mushes are also very generally used. Well-baked bread and thoroughly cooked breakfast cereals are both good for children and with milk should make up a large part of the diet. Bread may take the place, to a certain extent, of cereal mushes or vice versa, but neither can take the place of milk, meat, fruits and vegetables.

Fat is an important part of the food of children . Butter, which consists of separated milk fat, and cream, which is rich in milk fat and also in the other nourishment substances of milk, are both wholesome. Salad oils of various kinds may be given to children in small amounts. Bacon or salt pork, cut very thin and carefully cooked, may be given occasionally, but thick pieces with much lean are not desirable.

Vegetables, an important but often a neglected part of a child's diet, should be served at least once a day, as they help to keep the bowels in good condition. They may be used as flavoring for soups and stews, or served with meat gravy. Young children may be given the young and tender parts of celery and lettuce, a satisfactory way of serving being in the form of sandwiches.

Fruits are also very important in the child's diet. They supply mild acids and are important for their flavor, laxative effects, and no doubt for other reasons also. The laxative effect is well recognized in the very general use of orange juice, prunes, and apples, Then too, the fruits, like vegetables, have mineral elements which the body requires.

Simple sweets—lump sugar, maple sugar, syrups, honey and plain candy —are a desirable part of the diet. Sweets should not be given between meals or during the first course of a meal. Careful mothers who forbid their children eating candy at odd times sometimes give one or two pieces of wholesome candy as a "treat" with dessert at dinner.

NOVEL METHOD TO LAUNDER CURTAINS

Laundering curtains is a dread to some women. Yet if gone about in the easiest way it is not such a task. Lace does not require a stretcher. In fact, it makes the job more tedious in my opinion. First shake off the loose dust as soon as the curtains are taken down. The fold lengthwise two or three times according to width. Now fold the other way loosely back and forth while holding the free end in the hands, so the result is a practically square parcel which can be easily handled by lifting the upper fold without disturbing the lengthwise folds, curtains each being folded as explained permits handling without danger of tearing as the strain when lifted does not come on any one spot.

Next put the curtains to soak one on top of the other, in warm soapy water. Let stand several hours, or over night, to loosen the dirt, then gently squeeze each one and remove to another warm suds, but do not disturb the folds. Change the water repeatedly until the fabric is clean. Bluing will be added to the last water, then starch lightly. Up to this point no wringing is needed. After starching, squeeze as dry as possible but do not wring, as a lace curtain is easily ruined in that way. Now comes the stretching, which is done on the floor. Sheets or papers may be laid down in some unused room for this, but take it from one who ventured, that no bad results will come to curtain or carpet if pinned directly to the floor covering. The curtains will dry rapidly and can be taken up in a short time. Pin straight by breadths of the carpet, stretching to the original measurement.

All things considered, this is the most satisfactory way of washing lace curtains. There is no danger of injury to the fabric when handled in the folds and while some benefit might come from bleaching on the stretcher in the sun, no difference in effect is visible when the curtains are hung. They can be pinned to the floor in half the time required to get them on the frames, an operation often requiring four hands instead of two.

For scrim, madras or muslin, the folding method is also desirable, although not quite so important, as the fabric is stronger than lace. It saves time to square the pieces as nearly as possible when hanging to dry, and of course care should be exercised to iron them straight. With this class of curtains it is advisable to make top and bottom hems alike and turn end for end every time they are washed. This adds half to the wear of any curtain as the lower part is the first to give out.

DON'T PEEL POTATOES, FOOD EXPERT'S ADVICE

Probably no foodstuff loses so much in the hands of the cook as the potato. The vegetable is peeled and hacked until the part that appears on the table is but a small proportion of the root as it reached the kitchen.

"Don't peel your potatoes; cook them in their skins," is the advice of a food expert. Paring and boiling potatoes is most wasteful because:—

(1) Not only the skin, but the surface layer and perhaps 10 per cent. of the flesh are removed by thick paring, and the total loss may amount to as much as one-fifth of the whole root, or 1 lb. in every 5 lb.

(2) The surface layers which are wasted contain a larger percentage of solids than the remainder.

(3) The subsequent boiling dissolves out soluble ingredients of the potato, and also breaks down the surface into the water, which is thrown away.

Potatoes peeled and put into cold water and boiled have been shown by experiment to lose:—
Flesh-formation substances, 15.8 p. c.
Ash or mineral matter, 18.8 p. c.
Carbohydrates or starch, 3 p. c.

Boiled or steamed in their jackets they lose only:—
Flesh-forming substances, 1 p. c.
Ash or mineral matter, 3 p. c.
Starch, practically none.

Steaming is preferable to boiling, and the advantage of this method over that adopted by the "plain cook" is not only that a great economy is effected, but that all the flavor of the vegetable is retained. In steaming potatoes in their jackets a cut should be made in the skin at each end, to allow the steam to escape and prevent them becoming stodgy.

"Nothing can be done to safeguard the supply now," said a well known dealer, "but to cook the potatoes in their skins."

"That is a capital idea," said Mrs. Eustace Miles. "I should like to tell everyone, 'Don't waste potato peel.' For years we have served potatoes in their skins, and every day the number of people who ask for them so increases. Cooked in a double pan with

When You Paint Your Home

BE sure to buy a paint that measures up to highest standard in Appearance, Durability and Covering Capacity. If it lacks these qualities, you'll be disappointed in the job and soon will have to do it over again.

Run no risk. Be certain of the result before spending your money. Use

B-H "ENGLISH" PAINT

It contains 70% Brandram Genuine BB White Lead and 30% Pure White Zinc, mixed in pure Linseed Oil and ground to exceeding fineness in our modern plants. Science and extended tests have proved that this combination produces a paint of great Covering Capacity and Durability,—one that will protect your home against the destructive weather of Canada's changeable climate.

Other B-H. Products

hot air, and not baked, the skin itself can be eaten with perfect enjoyment. Indeed, you don't really know you are eating a potato until you eat the skin. Not only do you get greater nutriment in this way but you eliminate all waste and your potatoes go every much further."

THE GARDEN ON THE FARM

Very few people, whether living in the country, or in towns, or in cities, fully realise the possibilities of the small piece of ground represented by the back-yard of the ordinary city lot or the garden plot on the farm. The farm garden does not receive the attention of the farmer himself to a sufficient extent, and is often left entirely to the care of the farm women. More vegetables in the diet mean better health and cheaper living. This applies to the farmer as well as to the other members of the family.

Planting. If the farm garden is properly arranged, it can be worked with a horse and horse-cultivator, thus eliminating much of the drudgery. A plan should be made of the garden, preferably on paper, but at least in mind. This plan will be very useful when purchasing, planting and recording the dates of planting.

Soil Preparation. The soil should be thoroughly prepared. All rubbish and clods should be thoroughly cleaned out, and the coarser lumps of soil finely pulverized. If there is any doubt as to whether the soil is sufficiently prepared, give the garden the benefit of the doubt, and put a little more work on it. Well prepared soil means a proper seed-bed and better germination of the seed when it is planted.

Varieties. It is better to grow a few of the standard varieties of the more common vegetables than to attempt too many novelties.

Seeds. When buying seed, it is well to remember that the best are the cheapest. Deal with reliable seed firms and place orders for the seeds early.

Sowing. The seeds of such hardy plants as peas, spinach, radishes, lettuce, carrots and onions may be sown as soon as the ground is in proper condition. The seeds of tender crops, such as cucumbers, corn and beans, should not be planted until danger from frost is past.

There is no reason why there should not be a good and productive garden on every farm. It is a profitable undertaking and will give good returns. The time will be well spent and much may be accomplished in the time that the busiest farmer and his family can easily find if they have an appreciation of the importance of the garden and a disposition to undertake the work—F. C. N.

FEEDING YEARLING BEEF

The production of yearling beef or baby beef as it is commonly called, is never likely to be overdone, no matter what happens in the other lines of meat production. The difficulties of growing it and the fact that comparatively few feeders will become successful yearling finishers is the assurance that it will never be possible to create too many of these fat little market toppers. Yearlings to make the necessary weight at selling time, say 1100 pounds at the age of 15 months, must first of all have breeding. Spring calves will not make from 500 to 600 pounds in weight by November unless they have the building. They will not feed to the required 1100 pounds at marketing age if they are not naturally gifted in the art of transforming feed into flesh. Yearling feeders must be well bred steers, well grown for their age at weaning, carrying lots of calf fleshing. This calf fleshing must be kept on them, for its loss cannot be made up by anything the feeder may subsequently do. Therefore it is much more satisfactory to raise this class of feeder than to buy it. Calves cannot be bought in the market and brought home to the farm without loss of weight. Under feed they must be brought gradually to full ration. Full feed should not be reached until at least two months after the feeding has started. It is impossible or practically so to make anything of a steer that goes off feed. He will not lay on flesh afterwards and if the feeding in the early stages is overdone and some of the cattle affected, it is economy to remove them from the feed lot. They will not do right afterwards and will never make first class yearling beef Calves should double in weight between weaning and marketing. To do it the breeding has to be right and the ration adequate.

DINING CAR SERVICE ON OCEAN LIMITED

In placing the Ocean Limited again on the route between Montreal and Halifax, the Canadian Government Railways has paid particular attention to making the dining car service of this premier train meet the needs of its patrons.

Leaving Montreal at 7.15 p. m., the Ocean Limited carries a diner as far as St. Leonard Junction, serving dinner. This is proving a great convenience, especially to passengers arriving from Ottawa and Toronto to make connections for Eastern points.

This diner is picked up at St. Leonard by the Westbound Ocean Limited in the morning, and breakfast is served to passengers before the arrival of the train in Montreal.

The dining car service on the C. G. R. trains has reached a high state of efficiency, and is widely praised by experienced travellers.

McLAUGHLIN

EASE OF CONTROL

THE increasing number of lady drivers brings added popularity to the McLaughlin. Ladies, as well as discriminating men, like the beauty, style and comfort of the McLaughlin. But they like especially the *ease of control* —the quick response—the smooth flexible power, the safety and simplicity of operation of the McLaughlin.

The valve-in-head motor with sound engineering principles and advanced styles of coach building has established McLaughlin supremacy and won for it the appropriate slogan "Canada's Standard Car."

Our new catalogue gives descriptions and specifications of the 1917 McLaughlin series in Roadster and Five and Seven Passenger Touring and Sedan bodies at prices ranging from $910.

PATENT PAINTS OF NO AVAIL IN CONTROLLING ORCHARD PESTS

Widely advertised products for the control of blight, scale insects, plant lice, etc., upon orchard trees have been tested at the Colorado Experiment Station to determine their efficiency, and many observations have also been made in orchards where the paints have been used by fruit growers

We would hail with delight any preparation that would produce the results that are claimed for these products, but so far as our experiments and observations go, the indications are that such materials are useless for the control of blight in pear and apple trees, the San Jose scale, and the plant lice such as the woolly aphis, green, apple aphis, rosy aphis, etc. We are also unable to learn of any experiment station that has reported favorably upon the use of such products.

Fruit growers should not allow themselves to be influenced to purchase proprietary compounds that are being advertised for the control of insects and plant diseases without first consulting with the men at the Experiment Stations whose business it is to keep posted upon the value of preparations of all kinds that may be used for the control of disease and insects that infest orchard and shade tree.

Sows brought in to farrow after running outside all winter are liable to become constipated by the change of feed and closer confinement. If they do, trouble is likely to occur when the litter comes. To prevent this disorder feed the sow rather lightly and let a part of her diet be bran. Also roots, if any are to be had, and never fail to let her have access to soil. Soil to eat and root in is the cheapest hog medicine there is.

PALPITATION
OF THE HEART
SHORTNESS OF BREATH
CURED BY
MILBURN'S
HEART AND NERVE PILLS.

Mrs. S. Walters, Matapedia, Que., writes: "I wish to let you know how much good I have received by taking your Heart and Nerve Pills. I was suffering from palpitation of the heart and shortness of breath. The trouble with my heart was caused by stomach trouble.

I had tried all kinds of medicine, both patent and doctors', but I found none relieve me like Milburn's Heart and Nerve Pills. I believe anyone suffering like I did should use them. I only used four boxes and I now feel like a different person."

Milburn's Heart and Nerve Pills have been on the market for the past twenty-five years and have a most wonderful reputation as a remedy for all heart and nerve troubles.

Price 50 cents. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

WINNERS OF SPECIAL PRIZES

$5.00 donated by Fraser Lumber Co., for 1st col. of potatoes, Arch. Smith.

$3.00, donated by J. F. Tweedale, for 1st ol. of potatoes, Arch. Smith.

$1.00 donated by J. W. McPhail, for 2nd col. of potatoes, F. E. Henderson.

$2.00, donated by Mason Johnston, for 1st wheat, White Russian, H. G. Ervine.

$1.50, donated by M. L. Wright, for wheat, Marquis, J. R. Turner.

$1.00, donated by H. Stewart, for oats, Russian, F. E. Henderson.

$1.00, donated by R. Crawford, for oats, Swede, Walter Brooks.

$1.00, donated by D. R. Bedell, for oats, Early Yielder, H. G. Ervine.

$1.00, donated by J. W. Niler, for oats, Banner, J. W. Stevenson.

$1.00, donated by N. J. Woottin, for oats, Black, J. W. Stevenson.

$2.00, donated by G. B. McLaughlin, for barley, 2 rowed, J. W. Stevenson.

$1.00, donated by C. H. Elliott, for barley, 6 rowed, J. W. Stevenson.

$1.00, donated by H. Inman, buckwreat, rough, J. R. Turner.

$3.00, donated by R. W. Estabrook, for clover seed, Asa Adams.

$1.00, donated by A. Stevenson, for timothy seed, J. W. Stevenson.

$1.00, donated by G. T. Baird Co., for yellow eye beans, J. W. Stevenson.

$1.00, donated by Geo. Dionne, for peas, large white, H. G. Ervine.

$1.00, donated by A. E. Kuphey, for corn on cob, D. Curry.

ANNUAL SEED FAIR OF VICTORIA CO. SEED ASSOCIATION

The Annual Seed Fair of the Victoria Co. Seed Association was held on Tuesday, Mar. 27th, in Perth.

There were twenty exhibitors, but a number were unable to get there, as the roads were very bad, the snow very deep.

The judges were Mr. O. C. Hicks and Mr. S. J. Moore.

Prizes awarded as follows:

Wheat, Red Fife—1st, J. W. Stevenson, $2.00; 2nd, T. Stevenson, $1.75; 3rd, J. W. James, $1.50.

Wheat, White Fife—1st, H. G. Ervine, $2.00; 2nd, F. E. Henderson, $1.75; 3rd, D. Innis, $1.50; 4th, D. Curry, $1.25.

Wheat, White Russian—1st, F. E. Henderson, $2.00; 2nd, H. G. Ervine, $1.75; 3rd, Arch. Smith, $1.50; 4th, W. Brooks, $1.25.

Wheat, any other variety—1st, J. R. Turner, $2.00; 2nd, J. W. Stevenson, $1.75; 3rd, T. Stevenson, $1.50; 4th, Walter Brooks, $1.25.

Oats, Banner—1st, J. W. Stevenson, $1.50; 2nd, T. Stevenson, $1.25; 3rd, D. Innis, $1.00; 4th, J. T. Turner, $0.75.

Oats, Russian—1st, F. E. Henderson, $1.50; 2nd, R. Henderson, $1.25.

Oats, any other variety—1st, E. H. Sisson, $1.50; 2nd, E. W. Sisson, $1.25; 3rd, H. G. Ervine, $1.00; 4th, D. Innis, $0.75.

Barley, 2 rowed—1st, T. Stevenson, $1.50; 2nd, D. Innis, $1.25.

Barley, 6 rowed—1st, T. Stevenson, $1.50; 2nd, J. W. Stevenson, $1.25; 3rd, H. G. Ervine, $1.00; 4th, D. Curry, $0.75.

Buckwheat, rough—1st, J. R. Turner, $1.50; 2nd, J. W. Stevenson, $1.25; 3rd, H. G. Ervine, $1.00; 4th, R. Henderson, $0.75.

Peas, large white—1st, W. Brooks, $1.50; 2nd, D. Curry, $1.25; 3rd, D. Innis, $1.00.

Peas, small field—1st, D. Curry, $1.50; 2nd, F. E. Henderson, $1.25.

Beans, yellow eye—1st, F. E. Henderson, $1.50; 2nd, D. Curry, $1.25; 3rd, J. R. Turner, $1.00; 4th, J. W. Stevenson, $0.75.

Beans, white—1st, J. W. Stevenson, $1.50; 2nd, T. Stevenson, $1.25; 3rd, ;. Curry, $1.00; 4th, Alvin James, $0.75.

Beans, any other variety—1st, J. W. Stevenson, $1.50; 2nd, W. Brooks, $1.25; 3rd, D. Curry, $1.00; 4th, T. H. Manjer, $0.75.

Clover Seed—1st, Asa Adams, $1.50.

Timothy Seed—1st, J. W. Stevenson, $1.50; 2nd, T. Stevenson, $1.25; 3rd, D. Curry, $1.00.

Potatoes, Irish Col bler—1st, H. G. Ervine, $1.25; 2nd, F. E. Henderson, $1.00; 3rd, T. H. Manzer, $0.75; 4th, J. R. Turner, $0.50.

Potatoes, Green Mountain—1st, F. E. Henderson, $1.25; 2nd, E. H. Sisson, $1.00; 3rd, H. G. Ervine, $0.75; 4th, W. Brooks, $0.50.

Potatoes, Bliss Triumph—1st, Arch Smith, $1.25;, 2nd, F. E. Henderson, $1.00; 3rd, D. Innis, $0.75; 4th, R. Henderson, $0.50.

Potatoes, white, any other variety—1st, J. R. Turner, $1.25; 2nd, F. E. Henderson, $1.00; 3rd, Arch. Smith, $0.75; 4th, Asa Adams, $0.50.

Potatoes, red, any other variety—1st, G. G. Porter, $1.25; 2nd, H. G. Ervina, $1.00.

SKIMMING WHEY FOR BUTTER FAT

When some people get the new bulletin of the Vermont department of agriculture entitled, Skimming whey at cheese factories, they will wonder what it is all about. A careful reading will show how Vermont alone is wasting about $16,000 every year by not skimming whey. Commissioner Brigham and his associates point out that there is quite a bit of butter fat in whey as it comes from the cheese factory. As drawn from the vat it contains about 0.3% fat. Drippings from the press are much richer. The skimming of fresh whey does not materially lessen its feeding value for live stock.

A concrete example is cited, that of Meadowbrook factory at Middletown Springs, which skims whey successfully. For the first part of the season of 1916 there were 189,000 pounds milk received. The whey was skimmed, and butter made therefrom sold at 27½ cents returned $120. The total expense of the skimming including 20% interest and depreciation on money invested in necessary machinery, was only $33. This left net receipts of $87 from this one creamery. It returned farmers 4.6 cents more per 100 pounds for milk than they would have received if the whey had not been skimmed.

In 1916 Vermont produced 25 million pounds cheese. Counting it very low 2¼ pounds butter fat may be saved from each 1000 pounds milk received if the whey is skimmed. This means a saving of at least 56,250 pounds butter fat, which, figured as low as 30 cents a pound, would return $16,750. Thus is seen the importance of the bulletin in question.

When a factory wishes to skim whey there are a few essential points for success. First, all parties concerned must be interested. Second, some provisions for the extra labor must be made. The maker should be informed, when hired, that he will be expected to do this work and his salary fixed accordingly. Third, profits must be equitably divided. The total cost of equipment for skimming apparatus in a plant with 2500-pound daily capacity is around $385, for a 5000-pound plant $499, for a 10,000-pound plant $509. Many times this cost can be reduced by purchase of second-hand equipment. Furthermore, most factories have old vats which may be used as feed and storage tanks without additional expense. Whey cream may be disposed of in the same market as ordinary cream. Local restaurants and ice cream factories are desirable customers.

In conclusion, the bulletin states: "Whey skimming is no longer an experiment, but a proved paying proposition. It would mean a yearly saving of thousands of dollars to Vermont cheese factories. The invest-

DUNLOP TIRES

First and Still First

¶ No other tire can offer you a single feature not found in Dunlop Tires—"Traction," "Special" or "Plain."

¶ We are the founders of the tire industry in Canada, and our experience is greater than that of all other Canadian tire-makers combined.

CARBONOL

A Blessing in the Home

IF there is one thing you need around the home or farm, it is Carbonol. Good in a hundred different ways. Helps housecleaning. A few drops in a pail of water makes a bucket of antiseptic, grease-killing liquid. In solution, it is wonderful for cuts on yourself or your live stock. Drives away flies, disinfects the sick room, makes barns, stables and henneries sanitary. You should not be without it. Get some now. In bottles.

Carritte-Paterson Mfg. Co., Limited
Halifax, N. S. St. John, N. B. Sydney, N. S.

ment required is small. Farmers would receive more for their milk. The feeding value of the whey would not be materially lessened. Better cheese would result since factories could afford to pay higher salaries to competent cheese makers."

A GOOD WORD FOR THE MARITIME FARMER

The Enterprise, published in the enterprising town of New Glasgow, N. S., has the following advice for the farmers of Pictou county, in which it has a large circulation.

"Every farmer should take at least "one agricultural weekly or monthly "as the case may be; in fact it would "not hurt him to take two or three "of them for that matter. Every "trade and specialized occupation has "its own weekly or monthly devoted "to the interests of that particular "trade or occupation. And if the far"mer has any interest at all in his oc"cupation; if he desires to succeed "and become successful in his line of "business, he must keep in touch with "the great agricultural world around "him; he must keep up with the pro"cession, as it were, and be informed "of all that is being done and may be "done in the development and pro"gress of agriculture, not only in his "own province, but elsewhere.

"Now is the time for every well-to-"do and progressive farmer to ask "himself: What agricultural paper or "periodical shall I take that shall "help me and my family in the vari"ous branches of farm work that we "are engaged in at present? We shall "answer that question as follows:—

After saying some good things about several of the farm papers published in Ontario, The Enterprise concludes as follows:

"Coming down nearer home, we have the Maritime Farmer published at Sussex, N. B., twice a month, in the interests of the farmers of the Maritime Provinces."

It is also a creditable publication and deserves a larger circulation amongst our country friends. The information a farmer gains by reading it carefully should be worth hundreds of dollars annually to him and his family. As it is published nearer home, it should have the first claim upon the sympathies of the farmers of Pictou County. Only one dollar a year.

Our country readers can now have their choice. Subscribe annually to one or all of these.

VITALITY OF SEEDS.

All vegetable seeds have their limit in vitality. Some retain life longer than others, depending upon the condition, and the climate in which the seeds are kept. Seeds should never be kept in air-tight receptacles, as seeds need air the same as any other living matter. We give below a list showing the life of seeds. If they are older they are worthless. Also seeds do not keep so well in moist, warm countries as they do in a drier atmosphere. It is not safe to use older seeds than the limits given.

Asparagus 2 years.
Beans, 1 year.
Cantaloupes, 3 years.
Watermelons, 6 years.
Beets, 3 years.
Cabbage, 3 years.
Carrots, 1 year.
Cauliflowers, 2 years.
Celery, 3 years.
Collard, 4 years.
Corn, (Sweet), 2 years.
Cucumbers, 4 years.
Egg Plant, 5 years.
Lettuce, 1 year.
Okra, 3 years.
Onions, 1 year.

TANKAGE

Editor Maritime Farmer:

Will you kindly let me know where tankage,—the kind made from blood and meat scraps and used for feed, is to be obtained in Canada?

If it can be obtained, I would like to know if it can be depended upon as being of good quality and as represented by the producers. I would appreciate very much any information you can give me regarding the matter.

S. McL. D.

E. S. Archibald, Dominion Animal Husbandman says: We have tried two brands of tankage, namely the Harab tankage, manufactured by the Harris-Abattoir Company of Toronto, Ont., and the Swift Digester Tankage, manufactured by the Swift Canadian Company of Toronto, Montreal, etc.

Tankage has proven satisfactory in our feeding experiments, particularly in the case of young pigs. This brand of tankage is of course refined particularly for feeding purposes.

Write the manufacturers, we believe they will live up to any agreement they may make in regard to quality of goods they have to offer.

SPRAYING MIXTURES

Editor The Maritime Farmer:—

As a reader of your valuable paper and Secretary of the Agricultural Society of this place, I would ask you to tell me through your olumns:—

1. In what proportion does Paris Green need to be diluted for spraying cabbage and other vegetables;

2. Please give an outline of how it is prepared for use. Also Arsenate of Lead for same purpse?

3. In what proportion does formalin need to be used for disinfecting seed? Newfoundland.

Answer. 1. For dusting, mix 50 lbs. land plaster, air slacked lime, road dust or some similar substance with 1 lb. Paris Green.

As a spray, ¼ to ½ pound Paris Green must be put in 40 gallons of water, to which one or two pounds air slacked lime has been added.

2. If you use Arsenate of Lead paste, use 2 to 3 pounds to forty gallons liquid spray. If dry Arsenate of Lead is used, use 1 to 1½ lbs. to forty gallons.

3. One pint formalin to 40 gallons water.

THE MASSEY-HARRIS CO'S SPLENDID CONTRIBUTION

The Patriotic Fund and the Red Cross Society joined hands recently in an appeal to the generosity of Toronto citizens and firms, asking the immense sum of $2,500,000, and that it be raised in four days. Toronto, like every other city, town and hamlet in Canada, has gone deep into its pockets to aid such worthy causes.

Not only was $2,500,000 raised in the four days, but this sum was increased to $3,350,000, thereby maintaining its place at the top of the ladder as regards free-will offerings toward the war.

The Massey-Harris Company has always shown the right spirit in its contributions toward these funds and this year was no exception, when it gave to the campaign the magnificent sum of $20,000. In this connection it might be well to say that the Massey-Harris Company bought and is maintaining a hospital in England, one of the finest in that ountry, where many a Canadian hero is receiving treatment and recuperating from the Hunnish slaughter.

The Agricultural Instruction Act's Commission Addresses the Farmers of Nova Scotia

Address before Nova Scotia Farmers' Association, at Amherst Jan. 23rd, 1917.

Mr. President, ladies and gentlemen:

When I received the kind invitation from your Secretary, to attend the Annual Meeting of your Association, I began to look forward to the pleasure of making the acquaintance of the representative farmers of this Province, and to learn more about your conditions. I did not consider, however, that my limited knowledge of farming in Nova Scotia would justify me in addressing you at great length on this occasion. For a number of years I lived in Western Canada, and while there developed antipathy for the type of man who came to Canada from the Old Land went across the country on the train, looked out of the car window, and returned home to write articles for the press, or perhaps a book on the suitability of this Dominion for immigration, and on what the people living here should do to become prosperous. Were I to address you tonight on how to improve your conditions, I might be equally open to censure.

My personal knowledge of Nova Scotia has been confined to one previous visit, covering a period of a few days, but I have had the good fortune to come in contact with a great many born and brought up in this part of Canada, who went westward and became engaged in Agriculture, or located in the towns and cities of the Prairie Provinces, there to become prosperous. In my observations, I have noticed with a great deal of interest, that many Nova Scotians have gained positions of great prominence in the educational institutions of Canada. There are more college and university presidents in the provinces of this Dominion west of here who were born in Nova Scotia, than elsewhere. Your contribution to the educational institutions of the Dominion have been very great. In other important respects, notably in the number of statesmen contributed to the nation's chief legislative halls, the name of Nova Scotia stands high not at the head of all list.

Before proceeding to discuss certain aspects of the subject of Agriculture, I desire to say that, after all, the one question of supreme importance in Canada at the present time is the prosecution of the war to final victory. Even more than ever, we now realize that it is our war. We have begun to understand its meaning; we have felt its sacrifices. After more than two years of conflict, with an unprincipled and barbarous foe, we see clearly that less than complete victory for the armies of Great Britain and her Allies would mean disaster to the Cause of Peace, to the highest welfare of the human race in the days that are to come. Fortunately, our understanding of these matters has so developed that national determination to contribute as fully as possible, and in every way that will help, is even more fixed than it was one year ago.

Second only in importance to the prosecution of the war, the re-creation of national Agriculture must be considered. The progress of the farming industry, it is now apparent to everyone has a very close relationship to our winning the war. To fight well, our armies must be well fed. If every shell is a life-saver as well as a life-taker, it is equally true that every bushel of grain, every pound of beef, mutton and pork, every consigment of cheese and flour which we can produce and spare, over and above our own pressing requirements, will help to lighten the burden, and even save the lives of those doing their part nearer the firing line.

Canada's contribution in men has been admirable, and her contribution in food supplies has been of the greatest importance. It will be of even more importance during the year upon which we have entered. There never has been a time when we could so help in the great cause for which we are fighting; never before a time when the farms of Canada could so contribute toward hastening victory as by producing an abundance of food supplies.

This war has demonstrated more than any event in history, the vast, indeed the vital importance of successful agriculture to any country. Before the conflict began, this fact was slowly becoming apparent to the commercial and financial interests of the Dominion. Business men were beginning to realize that, in the cultivation of the soil and in the production of live stock, lay not only the basic industry, but the industrial and commercial salvation of this country.

Canada is essentially an agricultural country. Its chief asset is the soil. Great though the values of the products of the sea, forests and mines are known to be, the possibilities in plant and animal production far exceed them in magnitude and importance. In order to realize the significance of this statement, it is necessary to bear in mind that during the twelve months ending January, 1916, the total exports of farm products for Canada amounted to $337,620,583, while the exports from mines, fisheries and forests showed the sum of $136,580,135. or forty per cent. of the former. Moreover, the products of the mine were taken never to be restored, and those of the forest to be renewed only after many years, whereas the farm production, where intelligently carried on, was secured without depleting to any appreciable extent, nature's storehouse of ressources.

The manufacturing industries, it is true, have come to occupy a position of importance in the country's progress, but a large proportion are dependent upon farming for their raw materials, and almost all must look to the rural districts for a large part of the market for their finished product.

Therefore, the progress of agriculture in Canada is a matter of national concern; it affects everyone. The soundness of the old maxim that when farming succeeds all other interests succeed, and that when it fails no other business can prosper, has been demonstrated frequently in this country in normal times. That it will be even more evident in the future, appears certain.

In preparing for the important period of reconstruction, which will follow the conclusion of the world war, the highest interests of Canada can be best served by the adoption of such measures as will ensure that, so far as possible, the business of farming shall be both attractive and profitable.

It has long been held by authorities in political economy that no nation can succeed indefinitely without a vigorous, prosperous and contented population identified with rural life. As the source from which has come the main supply of strong manhood and womanhood to our seats of learning, afterwards to occupy foremost places in the various learned professions and positions of trust and leadership in the councils of the nation, the country home has been most conspicuous. It has contributed far above its due proportion. In all the chief elements that make for national stability, intellectual power and moral and social uplift, the home of the country stands pre-eminent. Within it the very soul of Canada may be said to be contained.

There has been for a number of years an alarming tendency for towns and cities to increase in population at the expense of rural districts. In many of the older parts of Canada there are fewer people now living on the land than there were fifteen years ago. The census returns for the decade 1901-1911 show that, while the urban population increased sixty-two per cent. the rural increase was only seventeen. During the same period the proportion of rural population decreased from sixty-two to fifty-four per cent. of the total. Various reasons have been advanced in explanation of why agriculture did not appeal to a larger number of the new settlers during the decade in question, but after due consideration has been given to all that can be said on the subject, the fact remains that had the business of farming appeared as remunerative and attractive as other callings, the result in extent of country population would have been more satisfactory.

In view of the great importance of rural population in the building of a nation, the question of how to ensure that, at the conclusion of the war, those engaged in agriculture shall constitute a proper proportion of the total population, becomes pertinent. Land settlement is a subject now being frequently discussed, and various schemes calculated to induce rapid occupation of uncultivated land have been advanced. It cannot be denied, however, that the first step in a permanent solution of the problem lies in developing such conditions as well enable those engaged in farming to be at least as prosperous and contented as those following other occupations requiring similar skill and energy.

Having in mind the present status of agriculture and the state of rural civilization desired throughout Canada, it becomes necessary to give consideration to the needs and problems which must be dealt with in order that the chief industry may make progress in keeping with its possibilities.

These may be stated as follows:—

(1). A supply of labour, male and female, capable of performing farm and household work.

(2). An organization of the business of marketing farm produce, and the effecting of such measures of control in the various stages as will prevent an undue proportion of the value of products being required to cover the cost of transference from the producer to the consumer.

(3). A widespread application of the principles of co-operation to the activities of those engaged in the farming business.

(4). An improvement in transportation facilities, especially highways, in order that the cost of conveying produce from producing to consuming centres may be reduced and the time required for delivery lessened.

(5). A readjustment of existing financial institutions or the establishment, if necessary, of new ones in order that money may be more readily obtainable for long and short term loans, for safe agricultural projects, at equitable rates.

(6). The providing of better educational facilities in country districts.

(7). An organized influence that will promote the improvement of social conditions in rural districts, in order that farm life may become more congenial and attractive.

(8). A more intelligent appreciation by the leaders of commerce and finance of the difficulties encountered by farmers in securing adequate returns for their labours.

(9). A higher degree of efficiency in farm management.

Upon each one of the problems thus briefly indicated, I might elaborate, but time will not permit. In speaking of Efficiency, to an audience of leading and successful farmers such as you are, I always feel a great deal like a clergyman whom I once heard say, that the fellows he desired most to influence toward better living he could never get within reach of his voice unless he was preaching a funeral sermon. They did not attend at other times!

I do not believe that you who are here need a lecture on the subject of efficiency, but you have a great influence over those who labour on farms around about yours, in the communities in which you live. As I intimated previously, I am not familiar with your conditions, but I venture to say that if all farming in Nova Scotia were as efficiently carried on as by the average of you, the products of the farms of the Province would be doubled annually. It is true, in the other provinces of Canada, that if the average in efficiency could be made to equal the practice of ten per cent. of those farming who are doing the best work, production would be twice what it is at the present time.

The question of efficiency is therefore of very great importance. Farming to-day, is a complex business; it is a combination of enterprises, and the one who does not so regard it, is doomed to failure. To be a really successful operator of land, one must be proficient in many things. He requires to be a combination of the practical scientist and the business man; he must be a judge of animal form, have a thorough knowledge of the soil; a fine understanding of dairying, of poultry-raising, and of the value of fertilizers. He must be a mechanic, capable of directing the repairing of farm implements, and more than all, have executive ability which will enable him to direct the affairs of his concern with greatest advantage. Heretofore, farming as practised by many has not been so regarded. It has not been taken seriously enough.

It is not long since the man who looked into books to improve his knowledge of farming, or who studied scince for the purpose of getting greater returns from the soil, was ridiculed by practical men; but that day has passed. I know that you, the leading farmers of Nova Scotia are not unappreciative of the value of scientific training in relation to successful agriculture. When I was in this Province a few months ago, I enjoyed a visit to your beautiful, well-equipped and efficiently managed College of Agriculture. I observed the attention being paid to the science of soil management, and to the importance being placed on the breeding and management of the live stock. I know of most successful short courses in farm management that have been held from time to time in various parts of this country. Hence, I understand your appreciation of these things, and am hopeful, very hopeful, for the future.

It was because of the great importance of teaching an agricultural science, that the Agricultural Instruction Act was passed in 1913, on the recommendation of Honourable Mr. Burrell, Minister of Agriculture. I do not need to say anything about the application of the provisions of this Act to work in this Province. You, I am sure, are quite familiar with what is being done.

In outlining this important legislative measure, it was thought advisable to set apart ten million dollars to be used during a period of ten years in the interests of Agricultural Education. Seven hundred thousand dollars were given to the provinces the first year, the amount being increased one hundred thousand dollars annually, until 1917, from which year until 1923, eleven hundred thousand dollars will be provided yearly. Twenty thousand dollars, of the sum it was decided, should be given to the Veterinary Colleges of Canada because it was felt that successful agriculture depended upon live stock raising and that therefore, the highest class of trained veterinarians that our colleges could produce would be required to aid in stock-raising. In addition to this

LOUDEN
Balance Grapple Fork

GIANT
Spreads when open 6 ft. 7 in. Tines go into hay 2 ft. Width of outside tines 25 in.

STANDARD
Spreads when open 4 ft. 10 in. Tines go into hay 2 ft. Width of outside tines 19 in.

For All Kinds of Hay

IN alfalfa, timothy, loose grain or straw, there is nothing to equal it. There can be no disappointment to the user of a Louden Fork. Build your loads without special care, by hand or with a loader, it does not matter, this fork goes right after it, and handles it right.

Not difficult to work

Our Patent Arch Support insures a perfect balance, and swings the fork true open or closed. Handled as easily as a harpoon fork, and gives much better service.

REMEMBER, there is not another fork just as good. Insist upon a Louden. Write for catalogue covering our complete lines.

"Everything for the Barn"

LOUDEN MACHINERY CO. OF CANADA, LTD.
Dept. 789 GUELPH, Ont. 7

sum, it was decided to allot to each province, regardless of papulation, the sum of twenty thousand dollars, the remainder being divided on the basis of population.

At the beginning of each fiscal year, April first, the Provincial Ministers of Agriculture submit to the Minister of Agriculture for Canada statements showing in detail how it is desired to make use of the provincial subsidy. If satisfactory to the latter official, agreements are entered into, and signed by the Federal and Provincial Ministers.

When this Federal money first became available, and it was decided to improve the facilities for placing Agricultural Instruction at the disposal of those who desired to be benefitted by it, it was soon realized that there was great need for more trained men in Agriculture. Accordingly, our Agricultural Colleges have been greatly strengthened. In some instances buildings have been erected from the Federal grant, and in almost all provinces the staffs of these provincial institutions have been increased or enlarged, as a result of the Federal aid. A special effort has been made to improve the facilities for carrying agricultural knowledge to those in the country too busily engaged to assemble at central points such as colleges of agriculture, where special courses are regularly given. A great deal has been spent on short courses in Agriculture for men and Household Science for women. District representatives and special advisors in agricultural subjects have been appointed and located permanently or temporarily in various parts of the country, their salaries and expenses being spent from this Fund.

It would be unwise for me, having already detained you at great length, to attempt to enumerate the many lines of valuable instruction being carried on throughout Canada under the provisions of the Agricultural Instruction Act.. It fairly may be said, however, that as a result of it, agricultural teaching, and the application of science to practice, both in our schools and on thousands of farms throughout the Dominion, have received a great impetus, and as yet only a beginning has been made of what there is to be.

late you upon the excellent organization that you have here in your Farmers' Association. The wide range of subjects that you take under consideration, and your method of discussion, are sure to bring great benefit to the business of farming throughout this country in future years. My best wishes I leave with you.

THE RELATION OF GOOD ROADS TO THE AGRICULTURAL DEVELOPMENT OF NEW BRUNSWICK.

Economists maintain that the transportation facilities existent in any country for the distribution of its products and the utilizing of its natural resources, are a fair index to its industrial and economic activity: the roads are a measure of its civilization.

The fact is indisputable that wagon roads follow the path of civilization and that good wagon roads play a very important part in the agricultural development of a country. No other factor so profoundly affects the rural welfare. The social, educational and financial well-being of the rural community depends, to a very great extent, upon its roads.

Statisticians of good roads economics have compiled data of the financial benefits of good roads to the rural community due to the decreased cost of hauling crops to market. The argument presented for road improvement being, that the saving thus effected warrants expenditures for highway improvement.

The difficulty of determining exactly the financial value of road improvement, based alone upon the cost of wagon transportation to the farmer, makes it doubtful whether any considerable expenditure for the improvement of rural highways can be justied when based upon such statistics alone. But, the saving in transportation costs, in conjunction with the enhanced value of land having access to an improved highway and other immediate financial gains which accrue to the community as a result of good roads, make it expedient that the highways be made efficient avenues of traffic. Furthermore, there is also to be considered the development and betterment of rural conditions effected from the standpoint of the social, educational and recreational needs of the community.

Ex-President Roosevelt has said, "Good roads are needed for the sake of their effect upon the industrial conditions of the country districts, and, I am almost tempted to say that they are needed more for their effect upon the social condition of the country." Who will say that the same necessity for good roads does not exist in New Brunswick? They bring the farmer nearer to business, nearer to church, nearer to the school and nearer to his neighbor.

Without good wagon roads the rural exodus from our country districts has been fostered due to the consequent isolation and monotony of country life. As a result, the younger generation was attracted by the activity of the city and, because of their inability to secure efficient help, farm owners in many instances have been compelled to abandon their farms.

It is an incontrovertible fact that good roads will do more for the development and betterment of rural conditions and for the maintenance of a desired standard of rural life than will almost any other factor related to agricultural development.

Apart from the ordinary use of highways as a social need, they may even become of great service politically, just as do railways and ocean steamship lines in the event of international troubles. This phase of highway utilization was well expressed by the slogan of the Dominion Good Roads Association,—"Good roads are a national asset and form part of the defence works of a nation." As a factor in the general welfare of the people wagon roads should be a subject of general interest and concern to both

The very close relation and influence of good roads upon the social, intellectual and business requirement of the rural community must be apparent to all. Any factor which contributes so much to the development and welfare of the rural district, as does this, must be given the whole-hearted support of the nation, for the well-being of the rural community is a matter of vital concern. The results are far-reaching. They even involve the welfare of the nation. A policy for good roads, then, may be urged for the same reasons that good schools are maintained, namely, because they increase the intelligence and value of the citizen to society; because they are a comfort and a pleasure; because they contribute to social and business advantages and are of themselves a sure index of the intelligence, enterprise and prosperity of a community.

The subject of highways has become a matter of general interest since they are now one of the utilities of public life with which practically all of our population come directly into contact. The people of the town know that good roads mean greater activity and greater business for both farmer and townspeople.

The radius of travel has been greatly increased by the introduction of the automobile. Traffic has increased immensely and the tendency is towards a still greater use of the highways, if we may judge from the increasing number of automobiles in use within our province and by the increase in the automobile business, which has now risen to fourth place among the great industries of the United States.

These conditions demand greater expenditures for extension and more efficient maintenance of the highways throughout this province.

To the farmer the improvement of the highway means heavier taxation and increased costs. However firmly he may believe that good roads are a necessary part of a good country life, he hesitates to make any radical change. The solution of the problem of securing appropriations for highway improvement and successful administration lies in the cooperation of efforts between townspeople and the rural population.

Nothing pays like first cost in road-building. "To build and not build well is wasteful; to build and not maintain is criminal." Hence a policy of road administration should make provision for location, construction and maintenance of its highways. There should be economical expenditure, permanent construction and efficient maintenance. Money expended upon intelligent study of the location is the most economical expenditure in the construction of a road. It frequently happens that a road which may have been considered "good" and properly located when the region which it traversed was new and undeveloped, may require to be relocated on account of an increased amount or change in the character of traffic.

The use of traction power for road-making purposes is now coming into use and under certain conditions has proven a very cheap and effective means of grading up country roads. It is a recognized fact that more work is required for the upkeep of the roads heavier machinery than horse-drawn has become necessary for the accomplishing of effective road work.

Canada is looking forward to a tide of immigration at the close of the present war, such as she has never had before. We assume that a portion of this settlement will be in the province of New Brunswick, for we have some thousands of acres of practically free land, capable of producing agricultural crops which will enable settlers to make a livelihood.

There can be no question as to the value of the land but are our highways, which form the transportation facilities, adequate to satisfy these people? They require facilities for the distribution of their products and the means by which to enjoy natural social conditions. The expense of hauling farm produce to market over the generally bad roads of the country results in a widespread reduction of the farmer's legitimate profits. We hear a great deal about questions of railway transport charges and of organization of cooperatiive societies to lessen the cost of market transport, but before we can materially lessen marketing charges and, incidentally, the cost of living, better roads must first be provided.

However pressing the need for good roads may be for transportation purposes, we must not over-look the fact that the interest in good roads has a broader foundation than mere commercial needs. Comfortable and easy communication between members of a rural community and also between rural and urban inhabitants is of great importance in the social, educational and recreational requirement of a community. Urbanization of population has proceeded faster in Canada during the past decade than in any other country. The urban population has in a large measure been recruited from rural Canada and, as a result, the country community has suffered; in the school, in the church, in the organization of effort of any kind.

Good Roads and the Consolidated School.

Many parents forsake the farm to educate their children in the town. These are just the class of intelligent people who are most needed in the country, compelled to leave because of the lack of an educational system which could be adopted in many communities if there were better roads.

It is safe to say that the common rural school does not meet the requirements of those dependent upon it so well to-day as it did a generation ago. To-day much more training is required to enable the country boy and girl to meet the demands on their intelligence. Its failure has directly contributed to the rural stagnation. From Massachusetts, where the first consolidated school was inaugurated, in 1874, a writer says, "Owing to consolidated schools, attendance has increased. We attribute this to the willingness of young married people to settle on the farms, since transportation secures to their children educational opportunities as good as the towns provide."

"In other States, miles of gravel roads have been built by the farmers to facilitate the transportation of pupils."

SMUT

(Continued from page 427)

then place in new bags or in bags that have been treated in a similar manner and thoroughly dried, thus preventing recontamination.

Take the precaution each year to treat your seed grain as above described. Soak all your grain sacks in formalin solution. Spray the grain box of your seed drill and when your grain bins are empty go all over them with a strong formalin solution. Treat other receptacles used for holding grain in a similar way. The fanning mill and the threshing machine must not be neglected.

Threshing machines that are taken from farm to farm to do custom threshing are frequently carriers of the infestation as well as of weed seeds.

If the foregoing precautions are followed, you will not only be able to check the trouble, but eradicate it entirely from your premises. The treatment is inexpensive and consequently it should be followed each spring as a precautionary measure. Prevention is better than cure.

FOR AN APPRECIATION OF CLOVER

(Continued from page 423)

dred pounds per ton of hay is a usual return. The cost of operating a clover huller should not exceed $10.00 or $12.00 per day, when threshing about 12 or 15 tons of clover hay.

Harvesting the seed crop is accomplished by cutting with a mower when the growth is excessively heavy; otherwise, by a self-rake reaper or even a binder, with or without the tying apparatus, but preferably without. A table attachment, or buncher, is made by some companies, attachable to their mowing machines, which work well where the crop is not heavy. From five to ten days are required to properly cure the crop. The bunches should be frequently turned when possible, while still damp with dew, so that scattering of the seed by the heads breaking off will not occur.

The crop should be stored in a dry mow, and not thrown into a deep, unfloored bay, which allows moisture to rise from the ground. It should be drawn in from the field when as dry as it is possible to cure it, for any dampness causes difficulty in the threshing and it sometimes injures the viability of the seed.

A variety of clover, of which great claims are being made to recommend it to notice, is the Sweet Clover or Tree Clover. Those who know the plant have popularly regarded it as a weed—but, a weed which bears the characters of a clover must have some traits which, under special conditions, would commend it to our use.

To many Ontario farmers it has proven a mortgage lifter, for, quick to seize the opportunity of supplying a demand for seed, they have met the demand of the seed merchant.

Sweet Clover will grow in situations where other clovers will not—along railroad tracks, gravel banks, fences, and upon hillsides, in the absence of humus in the soil, often reaching a height of ten feet under seemingly deterrent conditions. Knowing its habit, who can say that it has no place in our crop system?

As a palatable hay or pasture grass it is open to attack,—but those who have persistently grown it and fed it to stock, deny all these objections by saying that their stock prefer it to almost any other hay or clover, though it must be cut before blooming to be relished.

Practically any crop which is new to stock will not be readily eaten, especially if it is odorous, but if stock do not refuse to eat it. A very good plan to adopt when first feeding it to stock as hay, is to moisten it with briny water when they will eat it for the salt.

The seed of this plant closely resembles that of alfalfa, but can readily be distinguished by the sweet odor which arises when moistened.

It is sown at the rate of fifteen to twenty pounds per acre and, in poor soil, without a nurse crop. The plant does not bloom during the first year, nor should it be cut but allowed to freeze down, after which two crops may be expected during the following year.

White Clover seems to have been fully appreciated only by the people of Ireland, who, under the name of Shamrock, have adopted it as their national emblem.

Without question, white clover is the most valuable pasture plant which grows in New Brunswick. It will grow on almost any character of soil, sterile or fertile, cold or warm, moist or dry. It is rarely sown, except on lawns, but comes up of itself, sometimes almost disappearing one year, and in another year completely covering woodland and field pastures, particularly when these are grazed by sheep. It does not cause bloat. The seed of this plant is difficult to obtain in quantities and is very high priced.

As a honey plant, white clover is very highly prized, for the honey produced from it is of the highest quality.

Alsike clover is a perennial plant and in this respect it is superior to red clover. There is no plant known that will produce so much honey, butter, cheese, beef, mutton, wool and hay per acre as this plant. It is of all clovers the least sensitive to acid conditions of soil, and it also thrives on soils that are too wet for other clovers. On boggy or swamp land, It is often found thriving in standing water and this indicates the pronounced adaptability of this variety to water-logged land or to land which is subject to flooding at certain seasons of the year.

This variety is very prolific in the yield of seed, occassionally yielding as high as seven bushels per acre. The seeds are borne in pods like those of White Dutch clover and contain from two to four seeds in a pod. As the seeds are so much smaller than those of red clover, much smaller amounts are sown per acre, usually not more than three or four pounds.

Alfalfa has been called the "wonder crop". Wherever it has been well established it has received great favor, It is a child of the sun and revels in heat that would destroy any other species of clover. It is a perennial plant. Various types have evolved, some of which are very hardy. One such type, suitable for introduction into our crop system is the Grimm. This variety has been successfully grown within 150 miles of the Arctic circle where it matured seed during the year 1913.

Clover has been called the cornerstone of agriculture, because it is the forerunner of all successful agriculture. A farmer who is two poor to sow clover is too poor to own a farm. The introdution of clover into British agriculture gave it a stability which has made it a pattern for us.

Good pasturage is the most economical means of feeding stock, while hay meadows and other forage crops are but an attempt to maintain or supplement the gains made by stock on pasturage.

The more important the animal production, the greater the necessity that forage crop production constitute the farm scheme.

Clover acts as the miller and baker faculty of adding organic nitrogen to the soil by means of the root nodules, and because of the penetrating character of its root system, it makes a greater feeding area available for other plants.

The area within our province annually seeded to grass and clover approximates one hundred thousand third of which is seeded with grass acres. Thirteen thousand acres sown to wheat and seeded down, two hundred thousand acres sown to oats, one third of which is seeded with grass and clover and forty-nine thousand acres sown to buckwheat, one-third of which is seeded to grass and clover.

At the low rate of four lbs. per acre of clover seed, costing 25c a lb., one dollar per acre, the cost of the clover seed used is $96,000.00, and most of this is paid to growers in Ontario and in the North Central States. It is not business. Our climate is well adapted to growing vigorous seed of potatoes, grains, grasses and clovers—all we need to have is a proper appreciation of the agricultural possibilities of our province and of the potential value to our agriculture of the clovers.

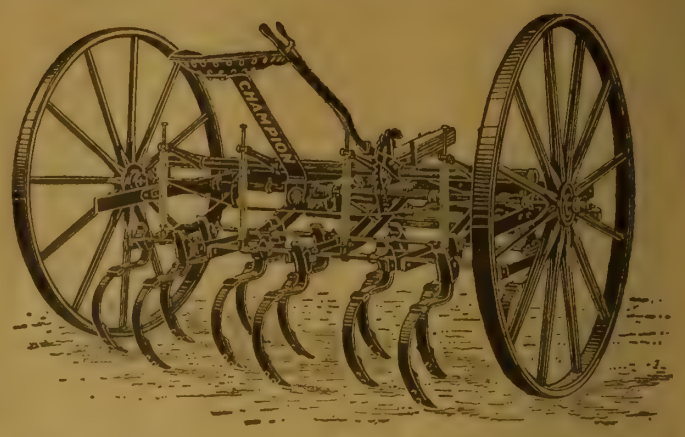
SHOEING OF FARM HORSES

(Continued from page 434)

they give no strength, nor too high, for then they do not clinch well, or, perhaps, they may not come out at all, but instead pierce the tender part of the hoof. The hoof is thinner than many persons suppose and care is always required to avoid driving the nails into the quick. No definite rules can be given for driving the nails; experience alone will teach the amateur that. It may be said that the straight side of the nail should always be toward the outside of the shoe. Use as small nails as will be necessary to

The Labor-Saving "CHAMPION"

This is one of the most popular of the Frost & Wood Cultivators. Its best friends are the farmers who give it the hardest work.



IT'S A PLEASURE TO USE IT

You know its going to do the work just as you want it done, without annoying delays for adjustments or repairs.

The Frost & Wood "Champion" Spring Tooth Cultivator

Helps you get a splendid seed bed with the least possible labor. Each spring tooth section works independently of the rest (so that uneven land is thoroughly cultivated) but all are controlled by one easily-worked pressure lever. Frame is of heavy steel, helper springs and teeth are extra fine-tempered spring steel; you can easily make it into a Broadcast Seeder, too, with grain and grass seed boxes, and get positive feed and splendid results.

For cultivating, we can supply both 2 inch and 7 inch points—the 7 inch make splendid thistle cutters. It's an immensely strong, light-draft implement that LASTS.

Write us for a Catalogue today, or drop into the nearest Frost & Wood agency and get intelligent advice on all your implement needs.

THE FROST & WOOD COMPANY, Limited,

Truro ST. JOHN Charlottetown

AMAZON ROOFING

HERE is a ready and easy-to-lay roofing that withstands all the elements and wears indefinitely. No better "rubber roofing" could be made. It consists of a strong, fibrous, all-wool felt thoroughly saturated with non-volatile compounds. It is the high quality of this felt and the skill of saturation that make our roofings supreme. They never dry out or run. You will see this if you try Amazon Roofing.

Real Roofing Insurance

Amazon on your steep-roofed buildings means real roofing insurance. It means, first and last, the best protection against wind and weather, that you can get. Wherever you have steep roofs, use Amazon. It will pay you. Made in three different weights to meet all roofing requirements. We carry them all and can fill your orders now. Do not neglect your roofs. Fix them once for all with Amazon.

to remain, and they will not injure the hoof so much as large and heavy ones.

When a nail has been driven into its proper place twist off the projecting point with the hammer claws, close to the hoof. When all the nails in the shoe have been treated in this manner, clinch the nails with the clinch tongs.—W. P.

IT PAYS TO TREAT OATS TO PREVENT SMUT

This is the time of year when farmers are making ready to sow oats. Most farmers know whether or not smut is present in their seed oats, but a considerable number of farmers do not know how significant oat smut is. Losses from this disease are commonly as high as 5% to 10%. They may run less, or may destroy 25% to 50% of the crop. The actual losses from smut are not often accurately observed in the field on account of the early spread of the smut-masses. The casual observer is wont therefore to underestimate the damage and lay the poor yields to other causes.

With but a small amount of trouble, and an expenditure not exceeding 2 cents per bushel, any farmer can treat his seed oats with formalin solution and eliminate the smut in one season. The treatment consists in sprinkling the grain with a solution, made by mixing 1 pint (1 lb.) of 40% formalin with 40 gallons of water. It is applied at the rate of one gallon to the bushel of grain, the grain being shoveled thoroughly during the application. The grain is piled after treatment and covered with wet cloth or canvas. After 8 to 12 hours the grain is spread out to dry. Further information will be gladly furnished upon application.

Wool is purchased by the manufacturer on the basis of the clean or scoured value. The dirt or foreign material incorporated in it is to him a waste product which is lost in the scouring process. The suint, yolk or grease may be saved, which in the refined state is known as lanolin and forms the foundation for the preparation of most salves used in medicine. However, the suint to the textile manufacturer is looked upon as a by-product, since facilities cannot always be installed to yield a profitable return for its preservation. An absolutely clean fibre can only be utilized in woollen manufacture. Therefore, it can readily be conceived how import it is to the manufacturer to recognize the degree of shrinkage of any wool, or in other words, the yield of clean wool after the grease and all foreign matter have been removed in the scouring process.

It is a common, but none the less erroneous, idea that electricity in the air at the time of a thunderstorm hastens the changes in milk. It is true that milk does sour quicker when a storm is approaching, but the reason is that the temperature is higher at that time. The milk is thus warmed more than usual and makes conditions more favorable for rapid growth of the germs present. This accounts for the very natural belief that the thunderstorm was responsible for the change.

When a cow is well along in her period of gestation an experienced man can usually determine whether or not she is in calf. It is done by placing the fist of the hand on the right side of the cow a little above the flank and then pushing in quickly. If the cow is well along in the period of gestation, the calf can be felt. If she is not, there is no way of determining wheth-

PEERLESS
PERFECTION
No matter how fast it comes, the most unruly animal can't break through a Peerless Perfection Farm Fence — it springs back into shape.
Made of heavy Open Hearth steel galvanized wire with all the impurities taken out and all the strength and toughness left in. Every wire is crimped making the fence into one continuous spring. Top and bottom wires are extra heavy. Will not sag. Requires less posts than ordinary fence. Absolutely guaranteed.
Don't buy a rod of fencing until you get our illustrated Catalog. Describes our big line of farm, poultry and ornamental fencing. Also Peerless farm gates.
Agencies almost everywhere. Agents wanted in all unassigned territory.

FENCE

Weak From Birth

Harriston (Ont.) Child Saved by Dr. Cassell's Tablets.

MR. CORBY, HARRISTON P.O., ONT., writes:—"Just a few lines in praise of Dr. Cassell's Tablets. Our little girl was weak from birth, and though we tried doctor's medicine and other things she got no better. She just lay in her cot and cried, and neighbours all said we could not save her. Then I read about Dr. Cassell's Tablets. I said to my wife, 'while there's life there's hope'; we will try these Tablets. We did, and from the first box we could see a change in the child. She seemed to rest more comfortably, and slept well at night. We kept on giving Dr. Cassell's Tablets till she was 18 months old, and now at three years I don't think there can be a healthier child in the whole Dominion.

Little Miss Corby.

The doctors said she had stomach trouble, and that her chances were small, yet Dr. Cassell's Tablets cured her. They have been worth their weight in gold to us, for we were just giving up hope of saving our little daughter. I don't think there is any other medicine for children like Dr. Cassell's Tablets. I may say my wife has taken them for nerves, and they have built her up splendidly. Publish this letter if you like: it may help others as the Tablets helped us."

Bright, healthy, happy children, full of life and activity—every mother wants her babies to be like that. Are yours? If they are not, if they are weakly or fretful—we say it in all sincerity—the surest way you will ever find to build up strength and vitality in their little frames is a course of Dr. Cassell's Tablets.

Dr. Cassell's Tablets

FREE SAMPLE.

On receipt of 5 cents to cover mailing and packing, a generous free sample will be sent at once. Address: Harold F. Ritchie & Co., Ltd., 10, McCaul-street, Toronto.

Dr. Cassell's Tablets are Nutritive, Restorative, Alternative, and Anti-Spasmodic, and the following

Nervous Breakdown	Sleeplessness	Mal-nutrition

THE RELATION OF GOOD ROADS TO THE AGRICULTURAL DEVELOPMENT OF NEW BRUNSWICK

(Continued from page 449)

Rural free delivery brings the farm within the daily range of the activities of the world and the isolation and monotony which has been the bane of country life are lessened to a considerable degree.

A good roads system would enable the mail-carrier to serve a much longer route and would even enable him to make use of the automobile. By this means the parcels post might eventually become an actuality and an instrument to facilitate the marketing of farm products.

The immediate effects of good roads upon the marketing problems and community situation are:—

(a) More easy intercourse is afforded between members of rural communities and also between rural and urban populations.

(b) A wider choice of markets is given, also an extension of time for the marketing of imperishable crops.

(c) An extension of the area devoted to fruits, vegetables and produce of a perishable nature, usually grown near large cities.

(d) An equalization of railroad traffic between different periods of the year.

The effect of good roads in creating community wealth is attested by the increase in the value of land in any community so served. The tendency is often to change rural districts into suburban property. Vacation residents are more easily secured and tourist travel is induced. This latter phase of the good roads movement should be taken up locally by the municipality and every effort made to attract it, for it has proven a source of community profit.

The problem affecting the rural situation in our province to-day is not only one of production but also how to make farm life satisfying in measures of happiness and prosperity. This implies the providing of **social conditions** (such as would be brought about by the building up of village centres) and **distributive facilities**, which will give the farmer a larger share in the price paid for his products by the ultimate consumer.

The highway is the great link of human intercourse; it raises social standards, it is a factor in our national, social and business life. Better roads, then, will contribute to efficiency in our national and business life, to social and educational advantages and prove a potent factor for the future industrial expansion and agricultural development of this province.

O. C. Hicks, B. S. A.

BACK YARD POULTRY KEEPING.

Town and city back yards should be utilized more generally for poultry than is now the case. Back yard poultry keeping pays next best to farm poultry, if not as well. There are many back yards and vacant lots that cannot be used for vegetable growing where poultry might be raised profitably. By means of a broody hen or an incubator, chicks may be hatched and afterwards brooded quite successfully on such lots. The broilers can be disposed of during the summer and the pullets kept for the production of eggs in the fall. If hatching is not practicable, day-old-chicks may be purchased. Another alternative is to purchase pullets in the fall, feed for winter eggs, and sell in the spring to make room for the garden. Only a cheap winter house is required, and when table scraps are judiciously used in the ration, the bill for feed necessary to produce winter eggs is comparatively small. Many a school teacher, stenographer or bookkeeper might add health and variety to his or her occupation, increase the income and have the satisfaction of helping to keep home fires burning by spending leisure time producing poultry products.

FARM POULTRY.

The farm flock always pays when given proper care. Production here might be materially increased with very little additional labour or expense. Adopt system in your work, and put the management of the poultry plant into the hands of a boy or girl. One farmer in Eastern Ontario made $4.00 per cwt. out of his feed grain by selling it as new laid eggs. If one can do that, others can. Feed is dear, but so are eggs.

Breed from bred-to-lay strains; market the eggs when new-laid; distribute the sale of table poultry over as much of the year as possible; cull out. the .weaklings and feed intelligently. Increased production will follow, resulting in a larger surplus to meet Great Britain's demand for eggs.

Elmwood Stock Farm

Offers for Sale :

Two choice young Holstein Bulls, 15 and 19 months old, sired by Dutchland Pietertje Count, whose four nearest dams have records averaging 28.61 lbs. in 7 days, a grandson of Colantha Johanna Lad "the world's greatest bull" 101 A. R. O. daughters, 4 over 32 lbs. and 7 over 30 lbs. Three of them world's records for 365 days.

Fir Shade Farm Dual-Purpose Shorthorns !

Several years ago I imported from Ontario three Dual-Purpose Shorthorn animals, and now have in my stable at Rothesay eight representatives of this breed. Two of the females are entered in the Record of Performance, and so far have done excellent work. If you feel disposed you might drop in and see these the first time you are in the vicinity. Perhaps some time when you are coming to the city you would let me know, when I could arrange to go to Rothesay with you.

P. R. L. FAIRWEATHER. St. John, N. B.

Do You Want It ?

One 200 Egg Peerless Incubator also Brooder to match. These were only used for two hatches and are in every way first class. Write and find out all about this chance if you are interested. Remember there is a bargain for somebody—it may be you.

T. J. HAWKINS,
Stewiacke, Col. Co., N. S.

YOUR CHURCH, YOUR SCHOOL, YOUR AGRICULTURAL SOCIETY

When a stranger visits a community, he or she is customarily taken around to see the various points of interest.

Man's first duty is to his God, consequently the community church should be one of the edifices to which residents may point with pride. If the proper community spirit prevails, and it will prevail if there is a live Women's Institute operating there, although the church building may not be very pretentious, it will be neatly kept both inside and out, and the grounds will be as attractively arranged as possible. We have seen such places in many sections of the Maritime Provinces. The impression created on the mind of the stranger and the value of the uplift such conditions give a neighborhood, can never be measured in dollars and cents.

We believe a great deal of the social life of a community should centre around their church. We see no sane reason why the community church should not be used more extensively than it is for matters of community interest. We have a number of pastors of all denominations who are not only leaders in spiritual matters, but who also lead in temporal affairs. May their number increase! The pastor who thinks it beneath his dignity to take part in a leadership of this kind, is missing one of the big opportunities that is within his reach for the uplift, morally, spiritually and temporally of the members of his flock.

The public school should also be a centre of interest. The school and its surroundings should be made healthful, attractive and cheerful for the children, the men and women of tomorrow, who there spend so much of their youthful lives. The condition of a school and its grounds in a great measure reflects the character of a community. Use it for community work.

Have you an agricultural society in your vicinity? If so, is it a live Society? A Society that is accomplishing results. If it is not just as live an organization as you would like, why not get at the root of the matter and try to discover where the trouble lies? Can you not do something to liven it? There are so many ways in which a live Agricultural Society can serve a community. Every class of tradesmen have their trade organization in which they take a great deal of pride, and which helps them in their respective avocations. We know of many Agricultural Societies that mean a whole lot to the communities where they are located. Your Agricultural Society can serve you and your neighbors. If you have been inclined in the past to knock the Society, change the tactics and try "boosting" for a while.

If you do not have an Agricultural Society in your parish, why not talk the matter over with your neighbors and seek for information as to how to get one organized. The Secretary for Agriculture for your Province will gladly furnish the necessary information and assist you.

We know of no organization that will place more money in your bank account than will a live Agricultural Society.

We know several Agricultural Societies that have been effecting a saving of from $5.00 to $15.00 per ton, according to grade, for their members on fertilizers purchased. Others purchase seeds, feeds and other commodities and deliver same at cost and charges to their members. Then there is the co-operative purchase of live stock and farm implements. Seed fairs, Standing Crops competitions and local exhibitions are also branches of activity and service

The Paint That Costs The Least

is the Paint that covers the greatest surface—that takes the shortest time to apply—that wears the longest. Martin-Senour "100% Pure" Paint does all three. Here's the proof. "100% Pure" Paint covers 900 square feet of surface per gallon.

Hand-mixed-lead-and-oil, and cheap prepared paints, cover only about 500 square feet.

The greatest cost of painting is for labor. It takes less time to apply Martin-Senour "100% Pure" Paint because its fine, even texture spreads much easier.

MARTIN-SENOUR

"100% PURE" PAINT

(Made in Canada)

is guaranteed to be exactly as represented. The purity of the White Lead and Zinc Oxide—the high quality of the Linseed Oil—the minute fineness of the grinding by powerful machinery—insure a paint that gives years of protection and beauty to your home.

Why use cheap paint—that is expensive to put on—when Martin-Senour "100% Pure" Paint wears nearly twice as long?

If you are painting this year, you'll be interested in our books—"Town and Country Homes" and "Harmony In Neu-Tone". Write for copies—free. 105

PASTURE MIXTURES

The grasses used for pasture purposes may be roughly divided into two classes: the bottom grasses and top grasses. By bottom grasses are meant such as develop their heaviest vegetative growth near the ground. Bluegrasses, redtop, brome grass and the clovers produce a low and dense growth. The top grasses attain a greater height and will produce a heavy growth further from the ground. Typical top grasses are orchard, timothy and tall oat grass. It is evident that for an ideal meadow, it would be advantageous to use a mixture of top and bottom grasses to produce a deep, dense growth of hay. Such a meadow, while producing a heavy crop of hay, would also develop a heavy aftermath or aftergrowth, furnishing pasturage until late in the season. For pasture purposes only, the top grasses lost most of their value because the close cropping that they are subjected to under pasturage prevents them from developing anything but a low ground growth.

There are a number of reasons in favor of using a mixture instead of a pure culture:

1. The root systems of grasses vary in depth, so that a mixture will have more thorough distribution of roots through the soil. Brome grass, for example, will go very deep, extending as far down as four to five feet. Bluegrass is very shallow rooted, producing its maximum root development in the upper six to eight inches. Timothy will occupy an intermediate region.

2. Plants differ in the utilization of plant foods in the soil, and where one grass requires a relatively large amount of some certain plant nutrient, another grass in the pasture may require only a small amount of the same. The plants are, therefore, not direct competitors of one another.

3. A mixture will suffer less loss by insects or disease since these are usually confined to one plant species in any one season. The same effect will also be noticed in case of drought. Some grasses resist drought more than others and will continue to grow, or at least remain green, during a period of drought. The reverse is also true, that is, in a wet place some grasses do not develop, and even die. Such grasses as orchard and Canada bluegrass will develop under both extremes. Red top and alsike clover will do well in the wet part of the meadow, and brome grass and sheep fescue will do well in the dry portion. Timothy, red clover and Kentucky bluegrass do not do well in either extreme, requiring medium conditions.

4. Legumes will aid the growth of neighboring grasses and even improve their composition by increasing the protein content. The grass mixture will thus tend to produce a more balanced feed.

5. A mixture will adapt itself better to a varying soil. In every field the soil varies in moisture, fertility, or physical condition, and any one grass can not develop equally under all conditions. There is an optimum field condition for each grass, and a good grass mixture on a field having varying soil types will be elastic enough to adjust itself to each difference and so produce the maximum yield.—Jersey Bulletin.

Just see what splendid, snowy white, delicious bread it makes!

Never in the history of the world did good bread mean so much to you as it does now. It helps to reduce the high cost of living by lessening the amount of expensive meats necessary, and is the cheapest, most nourishing and most extensively used food known. Decidedly you should have none but the best flour for your bread. That is why we can so heartily recommend

Cream of the West Flour

The hard wheat flour that is guaranteed for bread

None but the finest quality Western wheat, and unsurpassed facilities could produce such splendid flour for bread. You can see for yourself how rich it is in nutritious, body-building gluten. The gluten imprisons the gas formed by the yeast, thus enabling your bread to rise right away up out of the pans, making splendid big bulging loaves, light and flaky and full of fine home-made flavor.

Cream of the West flour is guaranteed. If for any reason you are dissatisfied with it, return the unused flour to your dealer along with this advertisement (our guarantee). He will return your money, and we will repay him.

Ask our Domestic Science Experts for advice

Bewildering little problems often arise in baking bread and pastry in spite of the most careful attention to recipes and directions. Bubbles or large holes sometimes appear in the bread for no apparent reason. The biscuits, you have to admit, are not always up to their usual standard. The steam pudding may become mysteriously soggy; obviously it is not the fault of either recipe or ingredients. The expensive fruit cake is burned on the outside and uncooked in the centre. *Why?* Our Domestic Science experts will gladly tell you the reason so you can avoid difficulties next time.

All you have to do to get our help is to write us a letter in your own words giving details of your baking problems. Give us the name of your dealer; also state what flour you are using. Whether you are using our flour or not we will promptly reply giving you the information desired. Write to-day. Address, Domestic Science Department, care The Campbell Flour Mills Company Limited, Toronto, Ontario.

Get these famous books without expense

By long experience we have learned that it is well worth while to induce bread makers to try Cream of the West flour, for they find it so good that no other flour can take its place. That is why we offer these splendid books free to users of our flour.

In every barrel, ½-barrel or sack you will find a colored library card. Collect these cards and send them to us in exchange for such splendid books as "David Copperfield," by Dickens; "The Three Musketeers," by Dumas; "The Last Days of Pompeii," by Lytton; "The Talisman," by Sir Walter Scott; "Henry Esmond," by Thackeray; "The Woman in White," by Wilkie Collins; "House of the Seven Gables," by N. Hawthorne. Also a splendid list for boys and girls. Complete list of titles and instructions how to get books is printed on every card. Try our flour and get card.

Ye Old Miller's Household Book has, in addition to 1000 splendid recipes, an extensive medical department dealing with accidents, sickness, etc. No home should be without this valuable book.

LATE BLIGHT OF POTATOES & ITS CONTROL

By Geo. Patrick, Inspector of Plant Diseases, Fredericton, N. B.

The Late Blight and Rot of the potato is generally known and recognized by all potato growers. It is one of the oldest potato diseases and it has been the cause of great disaster in many potato growing regions before methods for its control were known. The serious famine in Ireland in the middle of the last century was largely due to the failure of the potato crop, a failure caused by the prevalence and unusual destructiveness of Late Blight. A careful study of the disease has shown that on the American Continent it is largely limited to New England and the Northern States, extending into the potato growing regions of this country. It has been found to be largely distributed in Europe and may be disastrous throughout Great Britain, as well as east and west from Russia to France, extending even as far south as Italy. The serious importance which this disease may attain is largely dependent on climatic conditions, for it has been shown that it is usually more prevalent and active when favoured by warm moist weather. As a rule the fungus appears during the latter part of July and it is most abundant during August and early September. A few days of rainy weather suffice to give it a start and its distribution is then accomplished with great rapidity; whole fields may be devastated within a period of only a few days of such weather.

From a survey made in 1915 of the potato fields in different sections of New Brunswick, it was estimated that out of a loss of 47% to the total possible crop, Late Blight was responsible for 25%' or more than one-half of this loss. The total possible crop was estimated at 12,000,000 bushels, or, valuing potatoes on the moderate estimate of 50 cents per bushel, it caused a financial loss of $1,500,000. On the other hand, Late Blight is not the most serious disease if proper precautions are taken, because effective means have been discovered for its control, which is not yet the case with some of the other diseases.

Late Blight is caused by a fungus which lives during the winter in or on tubers infected with Late Blight dry rot. When an infected tuber is planted, the fungus often develops with the sprout. Sometimes these infected sprouts die before they reach the surface of the ground, but more frequently they produce diseased plants on which the spores or seed, as they might be called, of the fungus develops. The disease first makes its appearance on the leaves of the plant as irregular spots with a dark water soaked appearance and disagreeable smell. In fine weather these spots dry up and become brown. If the weather is moist they increase in size and number and rapidly destroy the whole plant. Also in moist weather the fungus usually appears on the lower surface of the leaves, around the margin of the infected spot; this however is not always apparent to the naked eye. Numerous spores are produced from this growth which are so minute that they are easily carried by the wind, to other sections of the field, and being distributed on potato leaves they will germinate and reproduce the disease, besides this, on falling to the ground they will work their way through the soil and attack the tubers. Thus the planting of diseased seed is almost sure to serve as the initial source of infection.

The leaves, as is well known, play a very important part in the assimilation of food, and if they are destroyed, few tubers can be fully developed on the plants. For this reason, the earlier Late Blight appears in the field, the more severe will be the loss. On the other hand, should the disease make its appearance later in the season, the tubers that have been already formed become infected and are thus rendered unfit for seed or table purposes.

Diseased tubers are characterized by a brownish dry decay of the outer tissue, which shows on the exterior as dark sunken areas. If the soil is heavy and wet, this dry rot is followed by a soft, ill-smelling rot, which may destroy the entire tuber. Infected tubers when stored, will rot and decay, especially when there is little ventilation through the heap. Since this is the case, as in many other diseases affecting the potato, it is unsafe to plant unsound tubers under any circumstances; nothing is known of any practical treatment to prevent the reproduction of the disease. The tubers to be used for seed should be selected immediately after harvest and should be stored by themselves in a dry, cool cellar.

There are two other diseases of the vine which are often mistaken for Late Blight. One of these is Tip Burn which occurs during dry, hot periods, following moist weather which has produced rapid and tender growth. This burning is due entirely to weather conditions, but may be prevented by the same treatment as applied for the control of Late Blight.

The other is Early Blight, a fungus disease which attacks the plants earlier in the season, but the spots caused by this, are more restricted than in the case of Late Blight and have to a slight extent the appearance of a target, due to concentric rings which develop. The spots are usually small. This disease may also be held in check by spraying.

Late Blight can in a great measure be controlled by the application of Bordeaux Mixture to the plants in the field. It is realized that a great many growers of potatoes make a regular and systematic practice of thoroughly spraying their crops and who have found this practice very beneficial. There are others who do not practice it so thoroughly and systematically and who become discouraged because better results are not obtained. There are also others who do not practice it at all, but who claim that they get good crops and do not suffer any more less than those who spray regularly. However, experiments have proven that spraying is a good form of insurance against Late Blight and have shown that even though a good crop may in some years be obtained without using Bordeaux Mixture, a far better one, containing a larger percentage of marketable tubers can be raised as a result of thorough and systematic spraying.

A number of experiments at the Experimental Stations and on private farms both here in this province and in the Province of Quebec, have been conducted during the past two seasons under the supervision of Mr. G. C. Cunningham, who is in charge of the Dominion Plant Pathological Labratory, Fredericton, which have proven of great interest and shown conclusively that spraying potatoes regularly and thoroughly is a paying proposition. In 1915, the results of these experiments were very apparent for the reason that Late Blight was more prevalent on the foliage in that year than in 1916. However, at digging time in both seasons it was found that the sprayed portions of the fields in each instance gave a far larger yield of potatoes than the unsprayed portions. The foregoing are some of the results obtained from crops where part was sprayed six times, part four times and part left as a control or check.

Another experiment conducted in this sections of the Province of Quebec with a 4:4:40 Bordeaux Mixture, produced still better results. A field belonging to a farmer living a few miles from Lennoxville was sprayed six times, with a portion left unsprayed. When the crop was harvested it was found that there was a yield of 273 bushels per acre from the field, while from the portion left unsprayed a yield of only 210 bushels per acre was obtained; a difference of 63 bushels per acre, or valuing the crop at $1.25 per bushel, a financial gain of $78.75 per acre.

At the Experimental Station, Fredericton, an experiment was conducted on two plots of Green Mountains and on one plot of Irish Cobblers. Six applications were made at intervals of two weeks, a portion of each plot being left unsprayed. The following results were obtained:—

RESULTS FROM A TEST CONDUCTED AT FREDERICTON JUNCTION, USING A 4:4:40 BORDEAUX MIXTURE.

Variety.	No. of applications of Bordeaux Mixture.	Marketable per acre.	Unmarketable per acre.
Green Mountain	6	315 bushels.	12 bushels.
Green Mountain	4	224 bushels.	27 bushels.
	Control (not sprayed)	172 bushels.	33 bushels.

Difference in 6 applications over 4 applications 91 bushels per acre.
Difference in 6 applications over Control 143 bushels per acre,
or valuing potatoes at $1.00 per bushel, a gain of $143. per acre.

RESULTS FROM A TEST CONDUCTED AT LENNOXVILLE, QUEBEC, USING A 4:4:40 BORDEAUX MIXTURE.

Variety,	No. of applications of Bordeaux Mixture.	Marketable. per acre.
Green Mountain	6	307 bushels
Green Mountain	4	294 bushels.
	(Control (not sprayed)	257 bushels.

Difference in 6 applications over 4 applications 13 bushels per acre.
Difference in 6 applications over Control 50 bushels per acre.
Difference in 4 applications over Control 37 bushels per acre.
or, valuing potatoes at $1.25 per bushel, which was the price obtained for the crop from this particular field, the financial gain from six applications over four applications was $16.25 per acre, from four applications over Control, $46.25 per acre, and from six applications over Control, $62.50 per acre.

RESULTS FROM A TEST CONDUCTED AT THE EXPERIMENTAL STATION, FREDERICTON, USING A 4:4:40 BORDEAUX MIXTURE

Plot.	Variety.	No. of Applications.	Yield of Marketable per acre.
1	Green Mountain,	6	250 bushels
1	Green Mountain,	Control (not sprayed)	166 bushels
2	Green Mountain,	6	235 bushels
2	Green Mountain	Control (not sprayed)	169 bushels
3	Irish Cobbler,	6	291 bushels
3	Irish Cobbler,	Control (not sprayed)	228 bushels

These results show a gain from the use of Bordeaux Mixture, of 84 bushels per acre in Plot 1, of 46 bushels per acre in Plot 2, and of 63 bushels per acre in Plot 3.

A further experiment conducted at Grand Falls during the season of 1915, showed at harvest time an increase in the crop harvested from the sprayed portion of the field of over 100% over that from the unsprayed portion. A double application was made each time in this experiment, that is, the rows were sprayed both ways, for the reason that the season was fairly well advanced before the first application was made, consequently the plants had made considerable growth. The following are the figures:—

RESULTS OF A SPRAYING TEST CONDUCTED AT GRAND FALLS, USING A 4:4:40 BO RDEAUX MIXTURE.

Variety	No. of applications.	Yield of Marketable potatoes per acre.
Carmen No. 1	3 (both ways)	282 bushels
Carmen No. 1	2 (both ways)	261 bushels
Carmen No. 1	Control (not sprayed)	119 bushels.

These results show an increased yield from the portion which received three applications, of 163 bushels per acre over the unsprayed portion, and an increased yield from the portion which received two applications of 142 bushels per acre over the unsprayed portion, or a financial gain of $163.00.

A number of experiments have been conducted and the results recorded, in addition to those set forth above, but sufficient are given here to show that, allowing for the price of labour and materials which during the past season were considerably in advance of those of previous years, there is a wide margin of profit to be obtained from following the practice of keeping potatoes regularly and thoroughly sprayed.

It will be observed that these experiments were conducted with what is known as 4:4:40 mixture. This was found very effective. To obtain some information with regard to the value of different strengths of Bordeaux, an experiment was conducted last season at the Experimental Station at Fredericton which gave the following results:

Mixture	No. of applications	Yield of marketable potatoes per acre.
4:4:40	6	435 bushels.
3:3:40	6	487 bushels.
4:4:40	4	469 bushels.
6:6:40	4	468 bushels.
Kiltone, 20 lbs. in 40 gallons of water	4	435 bushels.
Kiltone, 10 lbs. in 40 gallons of water	4	391 bushels.
6:4:40	4	379 bushels.
Control (not sprayed		316 bushels.

One of the chief points in obtaining good results from the use of Bordeaux Mixture, is its proper preparation. Bordeaux Mixture must be made up freshly each time it is used. However, copper sulphate and lime may be each dissolved in water and kept for an indefinite time; if sufficient barrel capacity is available, enough to last throughout the season may be prepared at one time. The vessels in which these materials are dissolved should be of wood. Iron vessels should be avoided when dissolving copper sulphate or preparing Bordeaux Mixture, for the action of copper sulphate on iron causes it to quickly become corroded.

Fill a barrel according to its capacity with water and for every gallon of water dissolve one pound of copper sulphate by tying it in a bag and suspending it just beneath the surface of the water until it dissolves. Thus there is one pound of copper sulphate in every gallon of the liquid, and when making a 4:4:40 mixture, all that is necessary is to measure out four gallons. The barrel must always be kept covered to prevent evaporation.

Place a corresponding amount of quicklime into another barrel of the same size and slack it thoroughly. Do not use too much water in slaking. When the lime is all slaked, add sufficient water to make a milk of lime containing one pound of lime in each gallon of the liquid. Keep this also covered.

The above two preparations are called stock solutions and to make forty gallons of spray from these solutions, the best way is to run sixteen gallons of water into the tank of the spraying machine, add four gallons of the stock solution of lime and stir well. Then dilute four gallons of the copper sulphate up to twenty gallons by the addition of water, strain this into the spray tank and mix thoroughly. Do not mix the copper sulphate solution and the milk of lime together before diluting them as the mixture made in this way is not so effective.

The poison for the Colorado Bettle may be applied with the Bordeaux as often as may be necessary. Either Paris Green or Arsenate of Lead or both may be used. Arsenate of Lead sticks better but Paris Green is quicker in action, so that it is safer to use both. Half a pound of Paris Green and one pound and a half of Arsenate of Lead to forty gallons of spray will prove effetive in most cases, unless the attack is very severe, in which case, these quantities may be increased.

The spraying experiments which have been conducted were not done with any particular make of sprayer, neither have we made any tests relative to the commercial value of different types, we are therefore not in a position to make any recommendations in this regard. We however would reommend a sprayer which has three nozzles to each row, that is, one nozzle to spray directly on the top of the plant and a pipe dropping between the rows with a "T" on, so as to be able to spray the lower leaves of the plant. This attachment will not be found on the sprayers but in most cases it may be had by special application.

Spraying should be commenced about the middle of July, or when the plants are about eight inches high, and continued throughout August and September.

The apparent difficulty in some instances, of getting through the rows in the latter month, without doing a good deal of injury to the plants, owing to their closing in, should not prevent spraying being carried on. Any little injury that may be caused, will be of insignificant proportions when compared with the increased yield and soundness of the crop due to spraying.

To obtain the best results from the use of Bordeaux Mixture, thoroughness is absolutely assential. It is almost useless to go over the field with the pump not in complete order or the nozzles not doing their part. All parts of the machinery should be kept in good repair; the incorrect working of even one nozzle may make a great difference in the results obtained. The whole of the plant must be covered with the mixture as infection can take place on any part of it, therefore the nozzle plays a very important part. It should send out the spray in the form of a fine mist, the finer the better. The nozzles should be brought into play a few feet from the end of the rows, thus giving the plants at the end an equal chance with the others.

Fifty gallons per acre is sufficient for obtaining satisfactory results during the early part of the season, but later, as the plants increase in size, seventy-five gallons should be used.

New Brunswick in Line For Increased Production

Despite the fact that the seeding season was close at hand when Hon. J. F. Tweeddale assumed charge of New Brunswick's Agricultural Portfolio and secured as his Deputy, Mr. W. R. Reek, one of Canada's ablest agricultural leaders, the question of increased production in the province has been ably grappled, and indications from all quarters point to united efforts for the promotion of this worthy cause.

The Conference held in Fredericton early in May, as stated in our last issue, was exceptionally well attended and particularly so, when one considers the brevity of the time in which the notice of meeting was issued.

The general committee appointed at the conference responded to a call to meet in Fredericton a few days later, when ways and means for carrying on the work were discussed and a strong executive to work in conjunction with the Department was appointed.

Seed grain and potatoes to the value of upwards of $26,000 have been distributed and paid for by farmers in cash or bankable notes, so that the money expended will be eventually returned to the Provincial Treasury, and a great deal of assistance in time of need will have been accomplished. Many farmers who would have had to go without seed to crop their cultivated areas, will now be able to do all that lies in their power to place the farmers on a plane with their brother farmers in other provinces of Canada in the great production campaign.

If there is one department more than another that should not be bothered by political interference, it is the Department of Agriculture. We have every faith in Mr. Reek as director of New Brunswick's Agricultural policy. He is a young man who has made good in every office which he has held since boyhood, and from what we know of him and his methods in handling men and momentous problems, we know he is the right man in the right place.

One of the policies of the New Brunswick Department of Agriculture, will be to put the very best men available regardless of political stripe, in the field. These men will be given a free hand and will be required to give an account of their stewardship.

We understand District Representatives will soon be appointed in several counties and their number will be increased as rapidly as competent men can be secured. The District Representative system is working a progressive revolution in agricultural matters in Ontario and other parts of Canada, and we feel confident that the farmers of New Brunswick will appreciate the services of the men who will be appointed to work with them in their respective counties. These men will have a practical and scientific knowledge of agricultural matters and farmers who will avail themselves of the advantages of service rendered by the representatives will profit thereby.

There are some people who are always skeptical about new ideas, and one does not have to listen to them very long in order to get their full measure. Cases are on record where men who came to scoff, remained to pray. We have repeatedly met cases where skeptics in agricultural matters have experienced a change of heart and profited thereby. Any farmer who keeps abreast of the times, knows the value of the services of District Representatives, and will be pleased to work with them.

The work of a District Representative helps to bring community interests in closer touch with each other. The best ideas for performing and conducting operations are crystalized and interchanged among the farmers of a community, and the uplift in a very short time is quite noticeable. We bespeak for the District Representatives of New Brunswick the hearty co-operation of our farmers.

CHECK INDIVIDUAL YIELDS

Contrasts of various kinds occur in many dairy herds. The eighteen cows in one herd in Ontario last year gave an average yield of 7,494 pounds of milk, 3.4 test and 259 pounds of fat. The individual tests varied from 3.0 to 4.3 per cent of fat as an average for the full lactation period. One cow gave 10,420 pounds of milk; another 7 years old, gave only 6,290 pounds; think of it, four thousand pounds less! One dame of eighteen summers gave 270 pounds of fat, and a two year old gave 237 pounds.

The highest yield of fat was 337 pounds of fat from a 7-year-old, another 7-year-old gave only 205 pounds of fat. If these two cows were fed grain in proportion to yield of fat, no expensive feed need have been misused.

A herd of seventeen cows close by averaged only 155 pounds of fat. It pays to find out just what individual contrasts are included in averages.

Another herd of 11 cows within a mile or two, that included five two-year-olds, averaged 7,780 pounds of milk and 297 pounds of fat. A two-year-old gave 219 pounds of fat, and an 8-year-old gave 390 pounds. Full information as to cow testing may be obtained on application to the Dairy Commissioner, Ottawa. C. F. W.

FIELD BEANS IN CANADA

By W. L. Graham, B.S.A., Assistant Field Husbandman

Field beans comprise many types of which the bush or dwarf varieties, including the kidney and haricot types, are grown for the production of ripened seed for human food.

Value

Beans have a two-fold value. They rank among the valuable foods, containing a higher percentage of protein than wheat or oats and even meat. Beans are also of value from a soil cultural aspect as they belong to a most impoirtant class of agricultural plants termed legumes which are capable of taking up indirectly the free nitrogen of the air and storing it in tubercles on the root systems of the plants in an available form of plant food for future crops.

Production in Canada

In Canada the production of field beans, commercially, has been carried on for the past sixty years, being confined largely to Southern Ontario. In the year 1916 according to the Census and Statistics Reports of the Dominion Department of Trade and Commerce, an area of 32,500 acres was planted to beans. The average yield per acre was 12.7 bushels with a market value of $5.40 per bushel. The total value of the crop was $2,228,000. It will be recalled that in certain districts in 1916 conditions for cropping were very unfavourable. These conditions prevailed in our best bean-producing sections with the result that the average yield per acre is low. In normal seasons in the past the yield per acre has been approximately 17 bushels.

At the present time field beans are grown in four provinces of the Dominion of Canada. In 1916 Ontario had a yield of 317,000 bushels; Quebec, 78,000 bushels; Nova Scotia, 13.800 bushels, and New Brunswick, 3.800 bushels. Thus in the past season 76.8 per cent of the beans produced in Canada, were grown in the province of Ontario.

Soil

Many types of soil are suitable for the growing of beans providing there is good drainage. Underdrainage is not absolutely necessary but is advisable here as with other farm crops. If a choice of land can be made select rich loams and sandy loams. Clay soils, however, in a good state of tilth may be expected to grow beans satisfactorily.

Rotation

In the rotation, beans should follow clover hay, pasture or meadow. They fall in the hoed crop class hence assist admirably in the preparation of the soil for grain crops and the accompanying seeding mixtures of grasses and clovers which should follow for best results.

Manurial Requirements

Applications of barnyard manure in fairly liberal quantities may be expected to produce a profitable crop of beans. A good dressing of well-preserved manure at the rate of 10 to 12 tons per acre, once in three or four years is sufficient. The application may be made in the fall, winter or spring or during the preceding summer. The manure, if ploughed in, should not be buried too deeply, but whether ploughed in or disced in, it should be thoroughly incorporated with the soil. Commercial fertilizers have not been used to any great extent in Canada nor are they likely to prove profitable where suitable dressings of barnyard manure are given and judicious crop rotations and cultural methods are practised.

Preparation of the Soil

Where it is necessary to use clay land for beans, it is generally advisable to plough in the autumn, turning a well set-up moderately deep furrow approximately 6 to 8 inches deep or as deep as the surface productive soil will allow. If lighter land is available good results may be expected from spring ploughing where the furrow is turned flat and not deeper than 4 or 5 inches. In either case the manure may be ploughed in or worked in on the surface with the disc harrow. A suitable seed-bed is fine and mellow at the surface but fairly firm underneath, which condition is obtained only by combined effort and thought on the part of the grower coupled with judicious use of the disc harrow, roller and drag harrow. The success of the crop depends largely upon this feature of thorough soil cultivation before seeding.

When to Sow

As soon as weather and soil conditions will permit, beans should be sown. The last week of May or the first week in June is usually the most suitable time for planting, although the time of planting may vary slightly according to district and season, but should not be delayed after the soil has become warm and dry.

Method of Seeding

Field beans are usually planted in rows 28 inches apart. The plants should be spaced from four to six inches apart in the row, but in seeding it is advisable to sow more thickly than this and thin to the required distance when the plants appear.

For planting special bean planters are available, but where the grower has a grain seeder that sows in rows, it can, by having some of the seed spouts closed, be used as a bean planter and thus save the outlay for a special implement.

The depth of planting will depend upon the kind of soil and its conditions with regard to heat and moisture.

The amount of seed per acre will depend upon the size used. From 3 to 5 pecks of seed will give a satisfactory stand.

Seed

Only well developed, well-matured, uniform, sound seed of strong vitality should be used. Beans from plants infected with the common disease known as anthracnose or pod spot, should not be used for seed. Diseased seed will usually produce diseased plants and infection may be spread to healthy plants. Hence it is advisable, where possible, to select the future supply of seed from the growing crop, from healthy parent stock.

The vitality of the seed can be learned by conducting a germination test. This test can be made at home by planting a uniform sample of the seed in a pot of moistened soil placed in a bright warm position, the living room being a very suitable location.

Good seed should produce uniformly strong sprouts in a period of five or six days.

Varieties

Some of the best yielding varieties of field beans are Pearce's Improved Tree, Schofield Pea, Medium or Navy, Common White Pea and White Wonder. These varieties require from 112 to 115 days in which to reach the proper stage of maturity for harvesting.

Cultivation

After planting, but before the plants appear, which will usually be from three to six days depending largely upon the weather, it is advisable to harrow the soil lightly with a slant-tooth harrow or even a light smothing harrow. This operation will break the crust, destroy weeds, help warm the soil and stimulate rapid germination of the seed and growth of the plants. As soon as possible after the beans are up, and can be seen in the row, the single and two-row cultivators should be used. It should be the aim of every grower to keep the soil stirred on the surface. Thus as promptly as practicable after each rain and in time to prevent the forming of a crust the soil should be stirred by means of the cultivator. The work of cultivation also should be kept well in hand early in the season so that little cultivation need be given after the blossoming stage of growth has been reached,

Hand Work

Usually a certain amount of hand-hoeing is necessary and this operation may be very much reduced by prompt and thorough hoeing in the early part of the growing season.

Harvesting

Where there is enough help or where small areas only are grown the beans may be pulled by hand. For large crops of beans it is generally profitable to use bean harvesters which consist of the ordinary two-wheeled cultivator equiped with two flat knives placed to form a V cutting two rows at a time and placing both rows into one windrow. The beans may be bunched by hand or by means of the side delivery rake which places from three to five rows together. After cutting, the beans should be kept clean and should be stored with as little weathering as possible.

Threshing

Specially constructed threshers are available. Sometimes with special arrangement the common thresher can be used; however, by this means there is more loss through beans being broken or split. These cannot be sold either for commercial or for seed purposes. For small quantities or for a special variety grown for seed it is often advisable to do the threshing with the flail.

Cost of Production

Cost of growing one acre beans at current wages for manual and horse labour and prices for seed:—

Ploughing	$ 2 50
Dis harrowing	2 00
Harrowing	50
Seed, 45 pounds at 15 cents per pound	6 75
Planting	50
Harrowing (1), cultivating (7) times	4 00
Hoeing, 2 days	4 00
Cutting	1 25
Bunching	1 00
Hauling	90
Threshing	1 50
Cleaning and bagging	50
Rent of land and use of machinery	6 00
	$31 40

From an acre of beans worked as indicated, from 12 to 18 bushels might be expected. Taking 15 bushels as an average crop, then one bushel ready for market would ost $2.09.

Equipment

Cost of extra equipment necessary for bean cultivation and harvesting:—

Double cultivator with harvester attachment	$60 00
Single cultivator	10 00
Total	70 00

Summary.

(1) The bush or dwarf varieties of beans are grown for the production of ripened seed for human food.

(2) Beans provide a concentrated and very valuable form of food.

(3) Beans are a valuable crop in a rotation, leaving the soil in a very suitable condition for following crops.

(4) In 1916, 76 per cent of the beans produced in Canada were grown in the province of Ontario.

(5) Beans will grow on any well-drained and well-manured soil.

(6) Thorough soil preparation is necessary for success.

(7) Beans should be sown as soon as weather and soil conditions will permit, that is, when the soil has become warm and fairly dry.

(8) Beans are usually planted in rows about 28 inches apart, the plants being thinned from four to six inches apart in the row.

(9) Sow seed, free from disease, of strong vitality and of reliable varieties.

(10) Cultivate as necessary to keep the surface soil stirred and free from weeds.

(11) Harvest the beans when dry and clean and with as little weathering as possible.

(12) Thresh carefully, split or broken beans cannot be sold either for seed or food purposes.

FAVORS A DOG TAX

Editor The Maritime Farmer:—

I understand you are one of a committee to wait on the New Brunswick Government re a Dog Tax, as a protection to the Sheep Industry.

As a breeder and raiser of sheep, I am very much interested in this question and am a strong advocate of such a tax.

We own a pure bred Collie dog, which is a great help to us on the farm, but I would be willing to pay a fair tax on same, if by so doing means could be found to rid the country of worthless dogs that are daily see on the road, crossing the fields and doing so much injury to the sheep breeding interest of this country.

E. Roy Raymond.

Bloomfield Sta., N. B.

SHORTAGE OF SWEDE TURNIP SEED

Swede turnip growers are urged this spring to endeavour to secure and transplant a few sound roots to produce seed for themselves and their neighbours. Owing to the abnormal conditions now prevailing there will likely be very little swede seed for planting in the spring of 1918 unless our Canadian swede turnip growers make provision for their own supplies by growing the seed themselves. Canadian supplies of swede and most other field root and garden seeds formerly came from Europe, but this source is now practically cut off. The prospects for home grown seed have been reduced by the present price of swede turnips for food purposes, as it would now take nearly two hundred dollars' worth of full grown swede turnips to transplant an acre for seed purposes. This factor has had the unfortunate effect of reducing the area in the eastern provinces that would otherwise have been planted for the production of swede seeds.

The lantern dangling on a nail behind the horses or cows is a mighty serious risk. String up wires in suitable places and fasten wire hooks to them to hold the lantern. It may prevent a disastrous fire sometime. Do it today lest you forget and suffer loss through neglect.

June 12-26

INCREASE YOUR CROPS BY STRICT ATTENTION TO FUNDAMENTAL PRINCIPLES

The farmers of Canada are advised to do their utmost to produce food supplies this summer. In August, 1914, the Maritime Farmer sounded the first note of the increased production campaign. We emphasized the fact then that the Empire's great need before the termination of the war, would be an adequate supply of food. Farmers were advised to get in readiness during the fall of 1914 to produce bumper crops in 1915. We ventured the suggestion that in all probability young men growing crops in 1915, might in the trenches in Flanders at a later date partake of the food they themselves produced. We believe our prophesy came true, and if the war continues, we believe some of the young men who are on farms during the growing season of 1917, will partake of the food they helped to grow, on distant fields of battle. The call is urgent, and our farmers are responding nobly and well.

The Increased Production Conference recently held at Fredericton, awakened a lot of enthusiasm which has developed into real, practical work.

The committee appointed at the Conference to work with the Department of Agriculture, met and appointed a strong executive committee that will help carry production's fiery cross to every part of the province. A strong campaign will be carried out for preparation early this year for the 1918 crops.

So far as the 1917 crops are concerned, not a great deal can be done by the government. It is true, large quantities of seed grain and potatoes were procured for the farmers on short notice, but this is a matter that should have been attended to early in the year.

The fact of the matter is that too many farmers neglect the procuring of their seed supply until they are ready to use it, and consequently a great deal of delay and disappointment ensues. Several cases came to our notice recently where farmers had neglected to procure their seed wheat supply early in the season, although some of their neighbors had home grown seed wheat for sale, of as good quality as the best they could import. Progressive farmers from other districts captured their supplies early in the season and now, May 20th, we hear some of the non-progressive expostulating on the fact that the government should have procured more grain for the farmers. We have no sympathy nor tolerance for men of this calibre. It is their own fault if they go without proper seed grain, and we hope the incident will teach a well merited lesson.

We presume that the majority of the readers of the Maritime Farmer have either grown an adequate supply of seed for their own use, or else procured same early in the season. We trust they have all used their fanning mills to good advantage so that the plumpest and best seeds are being sown.

We have no patience with a man who persists in growing smut, scab and blight infested crops when the remedy is so easily applied. There is not a reader of the Maritime Farmer who does not know what remedies to apply.

The farmer who does not know how to combat scab, smut and blight is evidently not a reader of an agricultural paper. He does not know his business, and seemingly cares less or he would get in touch with what his more progressive fellows know about the problems that confront them.

War on the weeds. Cultivate as thoroughly as possible and don't neglect to spray your potatoes early and often, for good results and increased yields. Study the article on combating Late Blight on other pages of this issue. The article in question is worth many times the Maritime Farmer's subscription price to any farmer who grows potatoes. Properly graded and treated seed, good cultivation, eradication of weeds and spraying to prevent Late Blight are a few of the things that each and every farmer, no matter how shorthanded in labor, can and should do for increased production, which means patriotic production, profitable production and a full pocket book.

ARE DOGS WORTHY OF MORE CONSIDERATION THAN SHEEP?

On another page of this issue will be found the gist of the 1917 Agricultural Legislation for the province of Nova Scotia.

We believe our Nova Scotia readers will agree with the wisdom of the measures to encourage dairying, the home growing of more bread stuffs, which will surely follow in the wake of the introduction of wheat mills, the encouraging of clover seed production and facilities for ditching.

Only farmers living in vicinities where creameries are operated, fully realize the benefits accruing from the establishment of a creamery in their locality. We have noted with pleasure the rapid progress in many sections that follow in the wake of the creamery.

The scrub bull nuisance has been a thorn in the flesh of our more progressive farmers for many years. If municipalities will see to it that the law in regard to bulls running at large is properly enforced and the legislation embodied in Bill 93 is adhered to, the scrub bull menace should be a thing of the past.

Several bills are included among those that went down to defeat that deserved a better fate. The Sheep Protection Act as it stands at present is a joke. Why the sheep industry is allowed to go unprotected, for unprotected it is so far as the present Act is concerned, is more than we can fathom. No sane man will venture to put his time and money in any business that is so precarious as is the sheep industry, while as unprotected against the ravages of dogs as it is at present in Nova Scotia. If there ever was a time in the history of Nova Scotia when adequate legislation was needed to protect a profitable food-producing industry, it is at the present time when production of food is so essential and everything that tends to deter economy should be eliminated. Our sheep flocks are producers of food and clothing. Dogs produce nothing and deter the efforts of men who are doing their best to heed their country's call for food production. Our sheep men want adequate legislation to protect their industry, but so many dog owners do not keep sheep and consequently they do not welcome tax on their unprofitable friends. We are sorry the Legislature of Nova Scotia did not arise to the occasion by passing the necessary legislation.

The sheep owners are not faultless in this regard, for had they written to their country representatives asking them to support the measure as was suggested repeatedly in these columns, they would undoubtedly be enjoying ample protection at this date. We would not be afraid to bet that there were more requests from dog owners asking that the Bill be not passed, than requests from sheep owners to have it passed.

When, oh when, will our farmers stand together as one man and make their wants known instead of allowing themselves to be overridden by other interests. No good government will disregard the requests of the masses when properly advocated and backed up by enough evidence to show that the people are sincere in their demands.

GROW YOUR 1918 TURNIP SEED REQUIREMENTS

We met Mr. S. J. Moore, Maritime Representative of the Seed Division, Ottawa, a day or two ago, and in the course of conversation re the prospects for the 1918 Swede seed situation, he told us that every indication points to a great scarcity in that commodity. An embargo has been placed on European grown seeds and consequently Canada must look to her home grown seed for supply. Turnip seed is easily grown. We would strongly urge every farmer who has some sound, smooth turnips left in his cellar or root house to set them out in the field, and let them produce seed. Plant them in rich, well cultivated soil so that the crowns are about one half an inch below the surface of the soil, rows three feet apart and roots eighteen inches apart in the row. Plant four roots for each pound of seed required and keep well cultivated and free from weeds until the tops are about 18 inches high. About the time the plants are going out of bloom, drive stakes and cris-cross twine between them to act as supports for the branches and prevent breaking.

We do not believe you will experience any difficulty in realizing at least 50 cents per pound for any surplus seed you may grow. If each and every farmer would grow even a few pounds, a seed famine in 1918 may be averted.

Our Nova Scotia farmers in 1915, who had never attempted the work before, produced 125 lbs. of extra good Swede seed on one-eighth of an acre and there is no reason why any farmer cannot obtain like results.

Agricultural Legislation Province of Nova Scotia '17

At the 1916 session of the Nova Scotia Legislature three bills were passed empowering the Government to give specific and practical financial aid in the further development of dairying, the erection of Roller Process Wheat Mills, and the purchase of such power agricultural machinery as clover hullers and ditching machines required for the development of agriculture in the various communities of the Province.

Or specifically Bill 71 makes provision for an expenditure not exceeding $20,000 for the building and equipment, with necessary plants and machinery, etc., of demonstration creameries or cheese factories, and in addition makes provision for the paying of running expenses of such demonstration creameries or cheese factories. The Government has already erected, and is now operating two creameries in parts of Cape Breton where a sparse population and lack of development of dairy farming made it difficult to make a private creamery a paying proposition. The Government agreement is to operate these two creameries, as well as one or two more that may be erected, until such time as they may become "going concerns", when they are to be purchased by the farmers of the communities in which they are erected, and to be operated by them as co-operative creameries. The policy has proved a good one to date in communities such as we have described, and provision is now made for extending the policy in order that the dairy industry of the Province of Nova Scotia may be further developed in these outlying communities where lack of means of manufacturing and marketing has retarded progress.

Bill 73 empowers the Government to spend a sum not exceeding $3,000 in one year for the purpose of assisting any Municipality, Agricultural Society, or persons to purchase clover hullers, power ditching machines, or similar agricultural machinery. The occasion for passing this Bill was the successful demonstration given of the possibility of clover seed growing in Nova Scotia, which was given by the Department of Agriculture operating a power clover huller in several communities of the Province. Last year in Nova Scotia, where practically no clover seed had previously been threshed this Government thresher handled some 15,000 lbs. of clover seed. Having thus demonstrated the practical possibility of farmers in certain communities growing clover seed, the Legislature passed this Bill in order, during the early stages of the development of clover seed growing, to assist in the purchase of the necessary machinery. Prior to the passing of this Bill there was similar legislation relative to assistance given to the purchasers of power ditching machinery. This legislation was repealed and the content of it embodied in the Bill which we have just discussed.

Scrub Bull Legislation

Bill 93, an amendment to the "Acts for the Encouragment of Agriculture," contains the following section: "Within a district in which an Agricultural Society has been formed and is in operation, or within a district in which a Live Stock Improvement Association has been formed and is in operation under any Statute of Canada, no unregistered bull shall be offered for service. Any person offering an unregistered bull for service in controvention of this section shall be liable to a penalty of $20.00 for each offence." This bill was passed as the result of resolutions from Agricultural Societies and Live Stock Improvement Associations, of which there are over three hundred in the Province, which societies and associations have been retarded in their constructive work because of scrub bulls offered in competition with pure bred bulls kept by these societies and associations.

Encouragement of Horse Breeding

It is compulsory, under the Legislation of 1912 and 13, to enroll all stallions offered for public service with the Department of Agriculture in the Province. While a large proportion of stallion owners have enrolled in the past, many have felt that they did not reap much benefit through their complying with the law. An amendment to the law was passed in 1917, which includes the following clause: "No charge made for the services of any stallion not enrolled under the provisions of this Act shall be recoverable by any action or proceeding." Any stallion owner not enrolling his stallion will be likely, under the provisions of this amendment, to have difficulty, to say the least, in collecting his accounts.

Farmers' Association

The Nova Scotia Farmers' Association was first organized in 1893. Since that time considerable legislation pertaining to the powers of this Association and making provisions for delegates, etc., has been passed. At the session of 1917, all this Legislation was consolidated with one amendment to the effect that no County Association may send more than four delegates to the Annual Farmers' Association meeting.

Blue Berries

A bill for the protection of blue berries in the Province carries with it matter of interest to farmers in some sections of the Province. Briefly, the essential feature of the bill is that "No person shall pick or rake from the bushes any blue berries by means of any scoop or other mechanical device, or otherwise than by hand."

Defeated Bills

Perhaps the most important bill which met defeat was an Act to Amend "The Sheep Protection Act." This amendment made provision for the taxing of dogs and for the paying of compensation to the owners of sheep killed by dogs, the owners of which are not known. The bill included a tax of $1.00 on dogs and $5.00 on bitches. It included the paying of compensation up to two thirds of the value of the sheep destroyed. It also contained provisions for the appointing of a person in every ward or polling district to be known as a sheep valuer, any three of whom might constitute a court to investigate claims for compensation. Also it contained provision that compensation must be paid by incorporated cities or towns for damage done by dogs owner or harboured within said cities or towns when the owners cannot be found.

This latter provision was one of great interest to farmers who claim that a large amount of the damage done by dogs to sheep is done by dogs owned in cities and towns. This bill would have passed had it received a little more support from farmers in the Province.

Another bill intended to encourage Sheep raising, which, however, was defeated was one in regard to line fences. This bill contained an amendment to the fence law to the effect that when requested a line fence must be of such structure as will turn sheep. At the present time many of these line fences are constructed out of two or three strands of barbed wire, which will turn all other classes of live stock except sheep. A farmer may wish to go into sheep raising, for which purpose the line fence must be made sheep proof; as the law now stands the proposed sheep farmer may have to pay the whole expense of this sheep proof fence, whereas the amended law would have made it compulsory for the neighbouring farmer to share half the expense.

Another defeated bill was an amendment to the Act in relation to the inspection and enrolment of stallians. According to this Act stallions in Nova Scotia must be enrolled either as 1, Pure Breds (Registered horses), 2. Grades (sired by registered horses but from unregistered dams). 3, Cross Breds (a term intended to include all other nondescript classes of stallions). Had the amendment carried this third class of horse would have been officially terms "scrubs", but the amendment did not carry, so that for another year they will retain their more fashionable name.

A defeated bill which occasioned considerable newspaper discussion was No. 187 termed "An Act to encourage the Raising of Cattle in the Province". The essential provisions of the Act were that between the first day of June 1917, and the first day of Jan. 1920, it shall be illegal to kill or slaughter any calves for any purpose, a calf being defined as any heifer, steer or bull under the age of one year. The only exceptions to this general law were to be the killing of any calf made necessary by disease, of the killing of a calf for the owner's use, and not for purposes of sale. Although widely discussed in the press, the bill received scant consideration in the Legislature.

Notes on the Cultivation of Some Staple Vegetables

It is very important that those who are making a garden for the first time should have some knowledge of the way to grow the different kinds of vegetables, hence the following information is given in regard to some of the staple kinds.

Carrots and Parsnips.

These should be grown in deep, thoroughly prepared soil of loose open texture, to admit of even root development. This is especially true in the case of parsnips, as a heavy compact soil develops a poorly shaped and rooty parsnip. The ground may be spring or fall manured, ploughed deeply and thoroughly worked.

The seed is sown in the open ground usually before the middle of May, in rows two and one-half feet apart, at the rate of two pounds per acre for carrots and four pounds per acre for parsnips. The carrots may be thinned to two inches apart, and the parsnips four inches. If carrots are spaced too far apart in the row they become too large for table use. The ground should be rich enough and sufficient moisture maintained by frequent cultivation to continue an even growth throughout the season. The root should be kept covered with soil to the top, preventing the top of the root from becoming green, which is objectionable for market carrots.

Beets.

Beets for early use should be started as early as possible on well prepared ground. For winter use seeding toward the last of May, or early in June, is advised, as the beet does not become so large. Any good soil will develop good beets providing a uniform growth is maintained. A checked growth has a tendency to produce fibre.

Six pounds of seed per acre is usually used. The seed is sown in rows two and one-half feet apart, and the plants thinned to three to four inches apart.

Beans

Beans do best on a fairly rich soil, and unlike the pea, require a warm situation and warm soil. While the pea will do well on a fairly heavy soil, the bean likes a loose, friable soil for best development. The seed should be sown not earlier than the middle of May. They are usually planted in rows two and one-half feet part, and the seed dropped two to three inches apart and one to one and one-half inches deep.

Successional sowings may be made every two weeks until the middle of July, for the purpose of extending the season into the fall.

Onions

Onions do best on a light loamy soil rich in plant food. Light loams can be worked to better advantage than heavier loams and do not dry out so badly during summer. An abundance of available plant food is necessary if profitable crops are to be obtained, and consequently a soil that has been manured for several seasons previously should be selected. The land should be free from stone, and weed seeds.

Onions may be grown in the same land year after year, and it cannot be made too rich. Well-rotted barnyard manure applied in the fall and ploughed in shallow, about four inches deep, is one of the best fertilizers. Fifteen tons per acre annually is a good application. If the soil is well supplied with vegetable matter successful crops may be grown with commercial fertilizers applied at the rate of 500 to 1,000 pounds per acre. This is sown broadcast and harrowed in just before seeding.

The ground can be best prepared with the disc, springtooth, and smoothing harrows, and should be well pulverized to a depth of four inches.

The seed is sown in rows on the level ground 12 to 14 inches apart and ¼ inch deep at the rate of 3½ pounds per acre. A hand seeder is usually used. A seeder and wheel hoe combined can be purchased from any seed merchant at a reasonable rate. Seeding should be done as soon in the spring as possible, so that the plants will get well established before the dry, hot weather of summer.

Maintenance tillage is done principally with the wheel hoe, and consists in keeping the surface ground loose around the plants and all weeds from starting.

The falling down and withering of the tops indicates maturity, at which time the onions should be pulled. They are left fo ra week to dry, after which they may be topped and put into slatted crates, or put into these crates without topping, aken to a shed and al-

lowed to cure for two or three weeks, after which they are ready for market. The advantage of the crate is that a small bulk of onions is together with plenty of ventilation, which is very necessary for proper curing for storage or shipment. They should not be stored in bags or in large piles in bulk. They may be stored in slatted bins arranged one above another, 10 inches to 12 inches deep. If stored the temperature should be kept as low as possible and the air be dry.

Onions may be started in flats in the hotbed or greenhouse ten to twelve weeks before ready to plant, being set in the open ground early in May. They will transplant easily, and good large plants will prove most satisfactory. About ten good plants can be grown on a square inch. The seed should not be sown too thickly. One and one-half to two pounds of seed will give sufficient plants to set an acre, spacing the plants four inches apart in rows one foot apart. The disadvantage is the expense of transplanting. For securing early onions and onions of large size this practice is advisable.

Cabbage

Any good garden soil will grow cabbage. A warm, well drained sandy loam, very rich in plant food, is best for early cabbage. A northern exposure is best for late cabbage and a heavy soil may be used. The cabbage is a gross feeder and there is no danger from making the ground too rich. Twenty tons or more per acre of manure can be used, and this may be supplemented with from 500 to 1,500 pounds of commercial fertilizer for an acre. Commercial fertilizer is especially advisable for early cabbage where the object is to develop marketable cabbage quickly.

If the ground has been manured in the fall and ploughed, it should be again ploughed in the spring and thoroughly worked to a depth of six inches.

For early cabbage start the seed about March 15. The seedlings are transplanted to two inches apart three weeks later, and will be ready for the open ground early in May. The plants are usually set on the level in rows 30 inches apart and 18 inches apart in the row. Late cabbage are usually grown from seed sown thinly in a cold frame early in May and plants from these are set in the field about the middle of June, spacing the plants in rows 32 inches apart and 20 to 22 inches apart in the row.

The usual maintenance tillage should be given during the summer, and the ground not allowed to become hard and compact or to dry out.

In the storing of late cabbage cut the heads during a dry day and store where good ventilation is possible. The air should be kept dry and the temperature as low as possible. The heads should be placed on slatted shelves far enough apart to store two or three tiers of cabbage, with a good chance for ventilation under the shelves. A confined atmosphere renders cabbage storage impossible.

Cauliflower.

The cauliflower requires a cool, rich loam. A northern exposure is best. Continuous growth is important, and anything that tends to check the plant in any way should be avoided. Dry weather often results in failure, and where watering is possible it may be advisable. For early and late cauliflower start the seed and handle the same as for early and late cabbage, except that more careful attention should be given to detail in the development of plants. Like the cabbage, it takes about seven weeks to develop a stocky, properly hardened-off plant. They may be spaced in the field the same as cabbage.

When the heads are three to four inches in diameter the leaves should be tied together over the head in order to develop a good white flower.

Turnips

The early turnips may be sown as soon as the ground is fit, in well prepared soil. The Swede turnip should be sown about the last of May. They do best on a good loam retentive of moisture. Continuous growth is necessary to develop good quality. Like most of the root crops, they develop best during the damp, cool fall weather, and the advantage of late seeding is that they make little growth during the hot summer, developing a succulent tissue in the fall. Swede turnips planted early are very liable to be checked in growth during the heat of the summer, developing a root containing much fibre, and lacking in quality.

Corn

A warm, friable, rich soil should be selected for garden corn. The seed is sown in hills three and one-half feet apart each way, and five plants allowed to develop in a hill. The seed is sown soon after the middle of May. Early and late varieties should be planted to extend the supply of table corn into the fall. As is the case with peas and beans, constant surface cultivation to keep the weeds down and maintain a loose surface mulch is necessary.

Peas

Garden peas may be sown as soon as the ground is fit to work. The land should be fall manured with ten to fifteen tons of well rotted manure per acre, and ploughed. This is well worked in the spring to a depth of five inches. The seed is usually sown in rows two and one-half feet apart, and the seed planted one inch apart in the row.

Dwarf and semi-dwarf varieties do not require staking. It is advisable to stake the tall-growing sorts.

If one variety only is used, successional sowings should be made every week or ten days until the first of June. The garden pea is a cool season vegetable, and will not do well during the heat of summer. The season may be extended also by planting late maturing varieties. The early seeding is usually made one to one and one-half inches deep; the later seeding, two to three inches deep.

Radish

The radish may be sown as soon as the ground is fit to work, in rows one foot apart, and the plants thinned to one inch apart. Successional sowings may be made one week apart until the first of June.

Lettuce

Any good garden soil will grow lettuce. The ground should be rich and fairly friable. The seed may be sown inside six weeks before planting outside is possible. The plants are developed as is the case with cabbage. They may be set in rows one foot apart, and six inches apart in the row.

Seed may be sown in the open ground as soon as it is fit to work, and the plants thinned to four or six inches apart. Successional sowings may be made every two weeks until the first of June. Seed may be sown the last of August for a fall crop on well prepared soil.—By W. Saxby Blair, Superintendent, Experimental Station, Kentville, N. S.

THE FIRST SPRAY

With the prospects for apples in 1917-18 still in doubt, it seems that the man who has from 20 to 90 per cent of his capital in Annapolis Valley orchard can only in justice to himself and his property care for it at least as well as he has in the past. In 1915 every pessimist in the Valley was crying, "We will get nothing for apples." In 1916 the cry was the same. We now know the effect of the prophecies and their lack of truth. We know that the effect was, that many people neglected spraying in 1915 adn 1916 and grew the poorest apples they had grown for years. As to the truth of the prophecies, in 1915 we got a good price for apples and in 1916 we got the best price in the history of the Valley. Our pessimistic prophets have, therefore, caused the loss of thousands of dollars to themselves and their neighbors, who believed them and grew poor crops and so could not take advantage of the high prices. In addition, and more important than the loss that has occurred, these prophets have been the direct cause of an immense amount of neglected orchard at the present time; orchards that cannot be brought back to full bearing until 1918 or 1919 at least. It is therefore questionable if anyone is justified in counseling the neglect of the orchard in 1917 even if we could be sure at the present time that the 1917 crop will not be worth picking. The effect that such neglect will have on the 1918 and 1919 crops would be very serious and, further, we cannot be sure that the 1917 crop will not be sold for high prices. No more are we sure that it will not be sold for low prices. We simply do not know. But we do know that neglecting our spraying in 1917 will probably result in a short crop in 1918.

Our friends who intend caring for their orchards this year with a view to growing No. 1 and No. 2 only, of which grades they know a market will consume twice as many as it will of No. 3, and who are also preparing for bumper crops in 1918 and 1919, will use the most effective as well as the cheapest spraying material and apply it in the most effective and rapid manner possible. We would direct their attention to Circular No. 8 of the Dominion Entomological Branch and if they are not already supplied with a copy, a card to G. E. Sanders, Annapolis Royal, N. S., will bring such a copy at once.

The time to apply the first spray is when the leaves are the size of a ten cent piece. There is now some leaf for the spray to stick to and the benefit from the srpay will extend over a longer period than if the spray is applied earlier. Many leaf-eating insects are killed by applying the first spray that would not be killed by an earlier spray.

Material: Lime sulphur, 1.009 sp. gr. or 3 gals. commercial strength to 100 gals of water, or 1-33, is the strength recommended. If home made lime sulphur is used it should be diluted according to the table on page 10 of Circular No. 8. Always use a hydrometer and test homemade material, as you cannot otherwise be sure of the strength you are using. For a poison,

PEERLESS GATES
Down the road or far across the fields is often an "entrance," a mere hole in the fence, a constant source of danger to stock getting through. The best way to
Keep Your Stock Where You Want Them
is to provide real gates, strong and durable. All Peerless Farm Gates are of heavy open hearth steel wire on strong tubular steel frames electrically welded in one solid piece, and braced like a steel bridge. No sag, no rust, no wearing out. Ask your dealer to show you Peerless Gates, also Peerless Perfection Farm and Poultry fencing with the famous Peerless lock at all intersections.

SUGAR PRICES UP AGAIN
The Way to Buy Sugar.
The daily papers reflect the sudden daily ups and downs of sugar prices. The economical housewife can have but one determination as a result: namely, to buy sugar in large quantities—which means 100 pound bags—when the prices are down.
And, of course, she buys
ROYAL ACADIA SUGAR
"Every Grain Pure Cane"
Then she is sure of the best sugar, bought in the best way—the economical, the convenient way. To such women the fortnights of highest prices have no terrors.
Royal Acadia Sugar is obtainable in 2 and 5 pound cartons, 10, 20 and 100 pound bags, barrels and half barrels.

PURE CANE SUGAR

Make Money this year from your "Sugar Bush"

Hundreds of farmers to-day make more profit from their "SUGAR BUSH," with less time and labor, than they do from any other crop on the farm.

The demand for Maple Syrup and Sugar is greater than the supply, therefore, prices are good and there is always a ready market.

If you have Maple Trees on your farm which you are not tapping, you are losing good money. Maple Trees always produce a fair crop. They need no care of any kind, yet, each year produce more, and are tapped at a season when you cannot do other kind of work.

WRITE TO-DAY, and let us tell you how to make the most out of your Maple Trees with the least time and effort.

Advertise in the Maritime Farmer.

arsenate of lime is recommended, in this strength of lime and sulphur, 2 lbs. to 100 gals.

Tests carried on by the Dominion Entomological Branch and by the Officers of the Experimental Farm go to show that the lime sulphur arsenate of lime combination not only gives less burning but is a better fungicide than the lead arsenate lime sulphur combination. In addition, the poison costs but little more than half as much as the same amount of poison in the form of arsenate of lead. It is in powder form and is much more easily agitated in lime sulphur than arsenate of lead. In buying and using this poison this year the apple growers of the Valley are not only getting a better poison to use with their lime and sulphur, but hey are saving between six and seven thousand dollars on the aggregate.

Application: Drench thoroughly at 200 lbs. pressure, using a Drive nozzle. In making this recommendation both speed in application and efficiency in the work have been considered. To spray a tree rapidly and thoroughly a large amount of material must be coming through the nozzle and to get a large volume through the nozzle there must be a high pressure behind the nozzle. At 200 lbs. pressure and a Drive nozzle the rod should not be held still and instant, but must be moved rapidly and constantly over the tree. The most important insect killed by this spray and one of the hardest to combat is the budmoth and it has been proved that the Drive nozzle is about twice as valuable as any mist nozzle in controlling that insect.

Substitute Materials.

Bordeaux mixture may be used for this spray, but at the present time we can see no advantage in using it in view of the fact that it will cost about twice as much as lime sulphur.

Soluble sulphur, 3 lbs. to 100 gals., and arsenate of lime, 1½ lbs. to 100 gals. Last year this combination was used in many orchards and where it was used only once no ill effects resulted. The soluble sulphur increases the killing qualities of arsenate of lime, so that a better killing agent results from the use of a smaller quantity of arsenate of lime with this fungicide than with any other so far tested. It may be that under certain conditions ill results would result from only one spray of this material, but in all of our work last year yellowing of the leaves only resulted from two, three and, sometimes, four applications of this material, the effect apparently being accumulative.

Considering the cheapness of this material and its high insecticidal value, it would seem best in view of the results of the experiments of the Entomological Branch last season, that we now recommend growers to try this combination, for a first spray only, on a small scale, say one tank, so as to see if there is any flaw in the theories founded on the results of 1916, as the proving of this material as safe, for ONE SPRAY ONLY, under all conditions, would be a great boon to the apple growing public.—By G. E. Sanders, Field Officer in charge, Dominion Entomological Laboratory, Annapolis Royal, N. S.

In growing late carrots, we plow under manure in early spring and let the ground lie until the second week in May. Then disk it twice, smooth off the ground in the morning and drill in the seed while the ground is moist in rows 26 inches apart. We start to weed when the carrots are getting the third leaf and thin out from 1½ to two inches. Then we go through them about every 10 days with a horse cultivator and spray with bordeaux mixture every week or 10 days after they are six or eight inches high to prevent blight.—George Demarest, New Jersey.

A Mower You'll Like

WHEN you come to buy your new mower this year, take a good look at the features of the **McCormick No. 6.**

Rough, stony, or stumpy ground has no terrors for the driver of a **McCormick No. 6,** because the floating cutter bar can be lifted quickly and easily, and fully twice as high as on other mowers, and as quickly and surely dropped again. No mower ever had a cutter bar that lifted so high without throwing the machine out of gear. The cutter bar weight is carried from the trucks, where it keeps both wheels hugging the ground, increases the tractive power, and lightens the draft of the machine. The bar itself is strengthened in two ways: At the butt it is a full half inch wider than the average bar, and it is heat treated throughout, like an automobile part, making an extremely tough, strong and rigid bar which gives a clean shear cut from one end to the other. The new **McCormick** mower is made in all desirable sizes.

McCormick rakes, tedders, International side delivery rakes, loaders, and hay presses are machines you are perfectly safe in buying. Write the nearest branch house for catalogues.

STRAWBERRY PLANTS !

We are listing fifteen varieties of strawberry plants this season; some of the best known at the following prices. Senator Dunlap, Warfield and Williams at $3.50; Sample, Buster, Haverland and Arnout at $4.00 a thousand. Send for our free Catalogue at once, or order direct from this advertisement and have your plants come early. Plants shipped early in the season always arrive in good condition and make a big row. Our plants are well rooted, true to name, and will give you the best of satisfaction. Send us one dollar and we will ship you post paid, 150 Senator Dunlap plants, enough for a small garden.

Head Office: 102 Prince William St., ST. JOHN, N. B.

Butter Parchment at the Farmer Office

"The Canaaian farmer hands his money to the Canadian manufactuer, who in turn pays wages to his employees. The money is then turned over to the Canadian merchant for produce bought from the Canadian farmer. Therefore, money paid out by the Canadian farmer for Canadian-made machinery comes back to him in actual cash, and in the form of better markets for his produce. Money paid for foreign-made machines is immediately sent out of the country, perhaps never to return."

The Renfrew Truck Scale

Short weights come out of your profits. To make sure of your profits, you must **know,** not guess, the **exact** weights of the produce and live stock you sell. The Renfrew weighs anything from a pound to a ton. It weighs accurately on even or uneven ground. After weighing you can truck the produce to the wagon. Write for scale booklet.

The Renfrew Sta-Rite Gasoline Engine

Faster moving farm production and scarcity of farm labor are only two out of many reasons for using the up-to-date farm engine. Let the Renfrew Sta-Rite run your cream separator, pump the water, saw wood, fill the silo and take care of all the power jobs in the barn and tool house. The Renfrew Sta-Rite is always dependable. Write for booklet.

Practical Patriotism

In these times of national stress, the Country implores the people to conserve every resource. Keeping your money investments confined to Canada is splendid patriotism, and good sound business too. Besides, you can easily prove to yourself that it is profitable patriotism for you to invest in the

Standard

—the machine that is entirely made and designed in Canada by Canadians. Every cent you invest in the Standard helps to maintain Canada's own resources and to build up her strength. But the Standard relies not upon your patriotism alone.—

The Standard saves one half-pound of valuable cream per cow per week over other machines. By its unequalled close skimming it gets all but one-tenth pound of butter-fat from 1,000 pounds of milk skimmed, while other separators lose one-half to a whole pound.

This saving may seem small until you realize what it means to you. With, say, eight cows, it mounts up to four pounds of extra butter-fat every week. At 30 cents a pound, butter-fat price, you make an extra profit of $1.20 per week, or, in 40 weeks of milking, $48.00. We will accept this amount as first payment on your new Standard. **With eight cows, your Standard pays for itself out of savings! Will it not pay you handsomely to replace your old machine and get the Made-in-Canada Standard?**

The Standard's close skimming is proven by Government Dairy Schools Tests. We are always glad to have the Standard tested beside any other separator, wherever made.

Send for interesting literature, also describing the Standard's self-oiling system, low supply can, interchangeable capacity, etc., etc.—features that are creating a big demand for this Made-in-Canada machine all over Canada, in the United States and other countries. Write to-day.

DAIRYING.

REARING DAIRY HEIFERS TO FIT THEM FOR HIGHEST PLACE IN THE DAIRY HERD

Perhaps no branch of the dairying industry is of greater importane than that of rearing the dairy calf. Many farmers do not raise their own stock, simply because they cannot see their way to raise the calves without whole milk. They maintain their herds by purchase, a most expensive and unsatisfactory way. By it, the farmer loses the valuable strains in his own herd, and in many cases only gets the rejects of the herd of the seller. The importance of this cannot be over-estimated, and we wish to interest all dairy farmers to raise and breed their own stock. It is a great gain for the industry of dairying when a farmer can be interested to improve his herd by his own breeding. The high price of milk is one of the drawbacks to rearing the dairy heifer, and also the picture of the skim-milk calf as being a small, unhealthy, stunted individual that is absolutely worthless. There are quite a number of stunted calves to be seen around the average farm, but such results should not be charged up to separated or skim-milk, but rather to the ignorance or carelessness of the feeder.

Perhaps no branch of the dairying industry requires such delicate handling or such watchful observation as the rearing of the heifer calves. They should be separated from the bull calves before they are two weeks old, or if possible they should never be allowed to run together in a loose pen. They contract bad habits of sucking each other, and bull calves are dangerous in this matter, for their urine will convey all its poisonous matter to the stomach and blood of the female. This alone is enough to set up stomach troubles in the young heifer calf that may ruin her usefulness through life. It is her capacity to digest and assimilate the nutritive element in food, that is her valuable asset as a cow and this faculty is largely regulated in its growth, by the watchful care of the feeder. Start with the idea of developing a good healthy stomach capacity, and along with pedigree or a proved strain, it is the great high road to success in dairying.

It is the safest and best pratice to tie up the young calves from the first, that is, if the dairyman is not fitted with single pens. A small halter or leather strap around the neck, with a ring, and a light rope with a swivel snap hook in it, may be used to fasten it in the pen. Unlike bull calves heifer calves can be petted to advantage. When a female calf learns not to fear its owner, and experiences only kindness, it kindles affection in the animal, which trait in her character aids her to give her the motherly instinct, and therefore her highest possible milk production. But the calf rearer must guard against being too good to the calf for overfeeding is possible, and a ruined stomach will be the result.

The dairy heifer calf should be handled and it is by no means necessary that the calf should be fed upon fresh milk from the cow. Cream and fat are not required by calf intended for the dairy, but a good frame of bones covered with healthy muscles. These are abundantly supplied by separated or skim-milk, and the milk is easily digested when given warm, at about 80 dog. F.

Calves fed on separated milk, will

For Better Butter use

Windsor Dairy Salt

Made in Canada

THE CANADIAN SALT CO. LIMITED 222

not look quite so thrifty for the first few months, as calves fed on whole milk or allowed to run with their mothers. But, if they are properly fed, they will be as good at the end of the first year of their lives, as those fed on whole milk or run with their dams. They know no period of check or setback which the whole milk or suckled calf gets at weaning time, and it is also a very expensive way of rearing calves.

The study of the following table will reveal the fact that there is very little difference between the composition of whole and separated milk:

	Whole milk	Separated milk
	Per cent.	Per cent.
Water	87.10	90.50
Fat	3.90	.10
Casein and albumen	3.40	3.57
Sugar	4.75	4.95
Ash	.75	.78

The fat in the milk is the least important constituent as far as calf rearing is concerned. The casein, albumen and ash, are the most important constituents of milk for the growing calf. These substances are used by the body for making muscle, nerve, bone, hair, hide and hoof. These elements are left in separated milk.

For a calf of average size it should receive about 8 pounds of whole milk a day for the first week, and at the end of the second week should be gradually weaned from whole milk and be given separated milk instead. The length of time that the calf should be fed on separated milk will depend upon the amount of separated milk available for this purpose. Some feeders wean their calves at four months of age, but it is better practice to feed skim milk until the calves are six months old. If one has abundance of separated milk it is profitable practice to feed heifers until they are eight months or a year old. This will ensure a better growth and better development, and heifer calves from high record parents, will pay the time and milk thus spent.

When three weeks old, have hay before the calf all the time, just a handful added fresh when eaten. Never mix the grain ration with the milk, always give the grain ration alone. Usually the calf will not eat over half a pound a day for the first two months. From this time forward until it is six months old a pound of grain per day will be sufficient. Two parts ground oats and one part linseed meal makes a very good grain ration for young calves, and alfalfa hay after the calf is 3 or 4 months old.

The heifer should be fed liberally and have regular rations given her. The feed prepared for the milking cows should be given to the heifers also, but just about half the quantity will be sufficient. Liberal feeding of good food develops the digestive functions, and the training of a heifer for the dairy should be such as to encourage the healthful disposal of as much food as possible. If a heifer becomes fat on liberal feeding instead of enlarging her general growth, it is a sign that she is not taking after the milking strain, and it will be a question if she will be suitable for the dairy. The training of heifers for their duties in the dairy should be a constant care of the dairyman. Not only in the breeding and feeding, but in acquiring docility which eliminates all cow vices. The "law of kindness is better than the rod" with the sensitive dairy female, and it is certainly more profitable.

This New Farm Boot

CHROMOIL TANNED

BY

Palmer-McLellan

FOR SUMMER WEAR

POSTPAID TO YOU FOR

$4.50

The wonderful chromoil leather in these boots is a big improvement on the best ordinary "Oil-Tan." It is waterproof not only on the surface but all the way through. It does not dry out nor crack from heat, nor stiffen up quickly from frost. It retains through everything the soft suppleness that makes it so comfortable.

The shape, too, is new and better, combining the easy comfort of the Indian moccasin with the permanent form of a regular boot. This is ensured by building it on a last, and giving it a solid extra long counter in the heel. It's a boot that will stand up to the hardest kind of service, in any weather, and outwear any other working boot you have ever tried.

At the same time, it is light in weight and easy on the feet, and remarkable value for the price.

If your dealer cannot supply you with these new Palmer-McLellan Chromoil Tanned Farm Boots, mail us the price and we will ship you a pair postpaid.

CHOPPED ALFALFA VS. BRAN FOR DAIRY COWS

Here is the result in brief of a test at the University of Nebraska North Platte substation to determine the effect of substituting chopped alfalfa for bran in the standard ration of 4 parts ground corn, 2 parts bran and 1 part oilmeal for dairy cows. In November, 1916, six pairs of dairy cows were selected with reference to lactation period, milk and butterfat production, age, breeding and other factors influencing their probable production during the next thirty or sixty days. One cow from each pair was put into Group A, and the other into Group B. The milk and butterfat production of the two groups had been about equal during the past month, and so far as could be foretold would be about equal during the next two months. All cows were handled in the same manner, excepting that during the first fifteen days the cows in Lot A were fed the standard ration of corn, bran and oilmeal, while the cows in Lot B were fed the same amount of grain, but in the mixture bran was replaced by chopped alfalfa. At the end

Eleven Good Reasons

Why you should buy a NEW DE LAVAL

GREATER CAPACITY: Without increasing the size or weight of the new bowl, its capacity has been increased.

SELF-CENTERING BOWL: The bowl is loosely supported upon the spindle and will run true and do perfect work even after long wear.

SKIMS CLOSER: The improved bowl design, together with the patented milk distributor, gives greater skimming efficiency.

DISCS INTERCHANGEABLE: All discs are exactly alike, are unnumbered, and are interchangeable.

FEWER DISCS: There are fewer discs in the bowl, although the capacity is greater.

EQUIPPED WITH SPEED INDICATOR: Every New De Laval is equipped with a Bell Speed Indicator, the "Warning Signal" which insures full capacity, thorough separation, proper speed and uniform cream.

EASIER TO WASH: Simpler bowl construction and fewer discs, caulked only on the upper side, make the bowl easier to wash.

EASIER TO TURN: The low speed of the De Laval bowl, the short crank, its unusually large capacity for the size and weight of the bowl, and its automatic oiling throughout, make it the easiest to turn and least tiring to the operator.

THE MAJORITY CHOICE: More De Lavals are sold every year than all other makes of separators combined.

TIME TESTED: The De Laval was the first cream separator. It has stood the test of time and maintained its original success and leadership for nearly 40 years.

SERVICE WHEN YOU NEED IT: The world-wide De Laval organization, with 50,000 agents and representatives ready to serve users in almost every locality where cows are milked, insures the buyer of a De Laval quick and efficient service whenever he needs it.

If you haven't the spare cash right now, that need not stand in the way of your getting a New De Laval at once. We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at the time of purchase and the balance in several instalments—so that your De Laval will actually pay for itself while you are using it and getting the benefit from it.

HOMESEEKERS' EXCURSIONS

Via
CANADIAN GOVERNMENT RAILWAYS,
To
Manitoba and the Canadian North-west

Choice of Routes—Through the "Clay Belt" Country

Second class reduced fare excursion return tickets will be sold from Maritime Provinces every Wednesday and from Province of Quebec every Tuesday up to and including October to Winnipeg, Regina, Saskatoon, Calgary, Edmonton and numerous other points in the Canadian Northwest. These tickets will be good for return within two months of date of issue and full particulars can be obtained from any Ticket Agent of the Canadian Government Railways.

Holders of these tickets have the choice of different routes. They can travel via Quebec and Canadian Government Railways to Winnipeg—the route of the "Western-National" Express, or via the new "Transcontinental Line" via Toronto, North Bay, Cochrane, Ont., and Canadian Government Railways to Winnipeg.

Homeseekers' tickets reading via Canadian Government Railways through Quebec will be good for stop-over at Stations, Doucet, Que., Hearst, Ont., and intermediate points while tickets routed via "Transcontinental Line" will permit stop-over at Cochrane, Ont., Hearst, Que., and intermediate stations, with the additional privilege of sidetrip tickets (if desired) from Cochrane to Canadian Government Railway Stations east thereof, to and including Doucet, Que., at special low fare.

The above stop-over and side-trip privileges are arranged in order to enable passengers for western points to inspect the famous "Clay Belt" of Quebec and New Ontario—a rich farming country opened up by the new line of the Canadian Government Railways. Those interested will be forwarded copy of booklet "Notes by the Way—Quebec and West", describing that territory.

LIVE STOCK.

WOOL

Wool. its a real live subject today and the farmers are realizing the value of the sheep industry as never before, owing to the record prevailing prices for both wool and mutton. The time has come for shearing again and placing on the market the 1917 wool clip which it is hoped will be placed on the market this season in better condition than ever before and with as little waste as possible. Previous to 1914 Canadian wool was sold under the one general term "wool", good, bad or indifferent, long and short, and all the various grades were sold under the one head and this state of affairs was the chief reason why our wool always sold low when compared with the price of wool ruling in other countries.

Sheep raisers, when they fully understand the conditions depreciating the price of Canadian wool and how these could, to a great degree, be rectified, were quick to take advantage of the assistance by the Live Stock Branch, Ottawa, in the marketing of wool. This assistance takes the form of aiding in the formation of Wool Growers' Associations, in introducing improved methods of preparing and caring for the fleece before offering it on the market, and in supplying expert wool graders to the Association. It has been the distinct purpose in pursuing this work to help improve the character of the wool clip and develop a national standard of wool grades. Accordingly the services of wool graders are furnished to classify the wool and arrange it generally in a condition most acceptable for market. Associations organized for this purpose carry on and control, through their own officers, all business relating to the collection of the wool and the conduct of its sale.

Advantages of the co-operative movement and the success of the operations of these Associations are clearly expressed in the rapid increase of amount of graded wool offered for sale since the inception of these activities.

The adoption of grading has created a spirit of rivalry, in which each farmer endeavours to outdo his neighbour, or prepare his wool in a fashion which will grade higher, the results of which are most wholesome and effective in obtaining a distinct improvement in the character of the product. This does not comprise the only respect in which beneficial results are exhibited. As the co-operative movement grew, a steady advance in the price occurred and the price of the classified product, sold through Associations, exceeded during all three years that sold by individuals in the old way. The revenue to a member of a society, it has been demonstrated, was greater than that he could have received by selling at a flat price through the ordinary channels. It is estimated from sources as reliable as can be obtained of conditions of this nature that the average price last year of all graded wool was 5½ cents higher than the average price of other wool sold in the country. This is conservative and, although not definite, yet was gleaned from information derived from many wool men and farmers in close touch with market conditions and in a position to observe actual sales. There are many instances of wool being sold in almost the same district where an Association existed at from 8 to 10 cents less.

There are already organized in the Maritime Provinces eight of these Wool Growers' Associations through which wool will be collected, graded and sold under co-operative basis this season. The following are the names of the Associations, the districts they cover, the Secretaries or Managers, the center at which the wool is collected, and the dates on which the grading will be done:

Sussex & Studholm, W. G. A.—M. A. MacLeod, Secy., Sussex, N. B., June 1-2-4, amount of wool, 8,000 lbs.

P. E. Island W. G. A.—W. J. Reid, Mgr., Summerside, Charlottetown, June 25-30, amount of wool, 40,000 lbs.

Antigonish County W. G. A.—Dr. Hugh McPherson, Mgr., Antigonish, N. S., June 6-7-8-9, amount of wool, 20,000 lbs.

Guysboro County W. G. A.—A. D. Macdonald, Mgr., Guysboro, N. S., June 11-12, amount of wool, 3,000 lbs.

Inverness County W. G. A.—John R. McDonald, Secy., Port Hood, N. S., June 14-15, amount of wool, 8,000 lbs.

Richmond County W. G. A.—Rev. R. A. MacDonald, Secy., St. Peters, N. S., June 16, amount of wool, 5,000 lbs.

Pictou County United Farmers—M. Tamplin, Secy., New Glasgow, N. S., June 18-19, amount of wool, 5,000 lbs.

Annapolis Valley W. G. A.—J. L. Pineo, Secy., Kentville, N. S., June 20-21, amount of wool, 4,000 lbs.

The wool should be sent in to the Association unwashed, that is just as it comes off the sheep's back, rolled and tied with paper twine or, if this is not available, with a hard smooth twine. The wool is then either sent by freight or carried in by the individual to the warehouse of the nearest Association in the district. The sheep men of the Maritime Provinces in marketing their wool through these Associations as a graded product and offering for sale co-operatively fairly large amounts of wool are bound to receive highest market prices and will help to make a standard not only for Canadian wool, but for the wool produced in the Maritime Provinces.

PROFITABLE BEEF PRODUCTION

The results obtained at the Experimental Farm at Nappan in feeding

"With your Milking Machine I can Produce Milk of Superior Quality"

The writer of the letter below is known throughout his district as a keen and rather critical judge of dairying methods and equipment. They say he is a "crank" on quality! Certainly the John D. Duncan Co., of Montreal, are most particular about the purity of the milk they get for their patrons.

RIVERFIELD, QUE., Jan. 25, 1917

Gentlemen:—
I have noticed some of the testimonials you are publishing and thought I would let you know how I like the Empire Milking Machine and Empire Engine which I purchased from you in the month of April, 1916. It has given entire satisfaction. I have had considerable experience with engines for many years, and am consequently in position to appreciate the merits of the Empire, and recommend same as one of the most reliable for milking machine and general farm work.
With your Milking Machine I can produce milk of superior quality, according to the statement of the John D. Duncan Co., to whom I have been shipping. I find that the machine is in no way injurious to the cows or teats, and no other trouble has been experienced. The speed at which the machine can milk is regulated by the class of cows and the quickness of the operator.
J. R. McKELL.

EMPIRE
Mechanical Milkers

produce milk of high quality, at the same time that they save time, reduce expense, increase profits, and make it possible to keep up and even increase the number of cows milked, in spite of the growing scarcity of help, They certainly are worth investigation.

Try an Ad in the FARMER

good stockers, heavy fed vs. good stockers, light fed, were as follows.

Eight steers were selected, in such condition that they could be classed as good stockers. These were dehorned and fed a preparatory ration for a few weeks previous to starting the test, in order to get them accustomed to their feed and surroundings, then divided into two lots of four each. The four heavy fed, or Lot 1, were given 50 per cent more roots and meal than were the four light fed, or Lot 2. Number of days in test 93; total weight at the beginning for Lot 1, heavy fed, 4573 pounds; at finish, 5295 pounds, an increase of 722 pounds. For Lot 2, light fed, at beginning 4206 pounds; at finish 4880 pounds, an increase of 674 pounds.

The original purchase price was 6.25 cents per pound, live weight. The selling price was 8.1 cents per pound. The gross profit for Lot 1 was $143.09; for Lot 2, $132.40. The total cost of feed for Lot 1 for 93 days was $99.16; for Lot 2, $75.29, leaving a net profit for Lot 1 of $43.93, or a profit per steer of $10.98; for Lot 2, a net profit of $57.11, or per steer $14.28, a difference of $3.30 per steer in favour of the light fed.

The average profit per steer for three years, over and above the cost of feed at market prices, was for Lot 1, $16.06; for Lot 2, 18.05, a difference of $1.99 per steer in favour of the light fed. The average cost for three years to produce 1 pound of grain was 11.08 cents in the case of heavy fed and 9.57 cents for the light fed. The ration fed to Lot 1 at the beginning of the period was 60 pounds roots, 6 pounds meal, 1 pound molasses. At the finish 40 pounds roots, 16.5 pounds meal, 2 pounds molasses. For Lot 2 at the beginning 40 pounds roots, 4 pounds meal and 1 pound molasses; at the finish 30 pounds roots, 11 pounds meal and 2 pounds molasses. The meal mixture was made up of 200 pounds of ground oats and barley (equal parts by weight), 200 of bran, 50 of oilcake, 50 of cotton seed.

The meal mixture cost $1.50 per hundredweight; roots were valued at $2.00 per ton; hay at $8.0 per ton; and molasses cost 20 cents per gallon.

It will be noted that the greater profits were realized for the lighter fed steers. Similarly the light fed good butchers, as per results given in Series One, gave the greater profits, but a greater difference was noted in the good butchers, light fed, than in the above instance, which would naturally be expected because the former are too advanced to make the same profitable use of the food consumed as would the latter. Nevertheless there appears to be a profitable limit in the amount fed, even to good stockers, as the above test verifies, as it also does, that good profits can be realized by the proper finishing of good beef.

KILL FLIES WITH FORMALIN

A quick and sure method of killing stable flies is to make a 10% solution of formalin in milk and sprinkle it on the cement floors and gutters. The flies are attracted to it and are killed in 30 minutes. Then the floors are washed and the stable is clean for the day. This operation is repeated each morning as long as necessary. At the beginning of the campaign it will take several mornings to clear out the flies, but after that it will be necessary to do it only as often as they become bothersome. Their breeding place in the manure pile outside the stable should be done away with and the manure drawn out daily to the fields or placed in a fly-tight pit.

CLEANING OUT THE WORMS

To rid hogs of worms feed a mixture consisting of six grains santonia, four grains calomel, one dram bicarbonate of soda for each 100 pounds live weight of hogs. You can get this mixture made up at your drug store.

Keep the hogs off feed, but not without water for 12 to 18 hours, and give this remedy mixed in a thick slop of shorts and water. You can mix the medicine first with a quart of dry meal and sprinkle this in as you stir the slop. Keep salt away from the hogs when giving them this medicine.—E.

PREVENTING HORNS

Horns can be prevented from growing on a calf by rubbing caustic potash on the little nubs that develop into horns. A good time to do this is when the calf is a week or two old. Wrap one end of the stick of caustic in paper to protect the fingers, moisten the other and rub on the nubs. Be careful that it does not run down the face and into the eyes. Removing the hair helps. Make three applications, allowing it to dry between each application. The calf should be protected from rain to keep the caustic from spreading.

"Before I bought a gas engine there were two or three that looked pretty good to me, and there was one, especially, offered at a considerably lower price than the ALPHA, that I came near buying.

"When I got thinking the proposition over, though, I figured that the ALPHA must be worth all its makers were asking or else it wouldn't be outselling the cheaper engine. So I finally picked the ALPHA, and I know now that I didn't make any mistake. One of my neighbors saved a few dollars (as he thought) by buying the other engine and he wishes now that he had followed my example and bought an ALPHA."

The first cost of an engine is the last thing to consider. What you are buying is not so many wheels, washers and pistons, but so much service. If you can't depend on an engine to do the work you buy it to do, it is dear at any price.

Thousands of Canadian engine-owners swear by the ALPHA because they have found that it is reliable at all times and under all conditions. It is sturdily built. It is simple in construction. It is powerful. It runs on either gasoline or kerosene and develops its full published horse power on a minimum amount of either. If you want an engine that you will be thoroughly satisfied with, put your money into an ALPHA.

Ask for catalogue, prices and complete information. Made in eleven sizes, 2 to 28 H. P. Each furnished in stationary, semi-portable or portable style, and with hopper or tank cooled cylinder.

POULTRY.

FEEDING YOUNG CHICKS TO KEEP THEM IN HEALTH

Young chickens should be fed from three to five times daily, depending upon one's experience in feeding. Undoubtedly chickens will grow faster when fed five times than when fed only three times daily, but it should be borne in mind that more harm can be done to the young chickens by overfeeding than by underfeeding. Young chickens should be fed not more than barely enough to satisfy their appetites and to keep them exercising, except at the evening or last meal, when they should be given all they will eat. Greater care must be exercised not to overfeed young chicks that are confined than those that have free range, as leg weakness is apt to result in those confined.

The young chicks may be fed any time after they are 36 to 48 hours old, whether they are with a hen or in a brooder. The first feed may contain either moistened hard-boiled eggs, stale bread, pinhead oatmeal, or rolled oats, which feeds or combinations may be used with good results. Mashes mixed with milk are of considerable value in giving the chickens a good start in life. The mixtures should be fed in a crumbly mash and not in a sloppy condition. Dry bread crumbs may be mixed with hard-boiled eggs making about one-fourth of the mixture eggs, or rolled oats may be used in place of the bread crumbs. Feed the bread crumbs, rolled oats, or mixture five times daily for the first week, then gradually substitute for one or two feeds of the mixture finely cracked grains of equal parts by weight of cracked wheat, finely cracked corn and pinhead oatmeal or hulled oats, to which about 5 per cent. of cracked peas or broken rice and 2 per cent. of charcoal or millet or rape seed may be added. A commercial chick feed may be substituted if desired. The above ration can be fed until the chicks are two weeks old, when they should be placed on grain and a dry or wet mash mixture.

After the chicks are 10 days old a good growing mash, composed of 2 parts by weight of bran, 2 parts middlings, 1 part corn meal, 1 part low-grade wheat flour or middlings and 10 per cent. sifted beef scrap, may be placed in a hopper and left before them all the time. The mash may be either fed wet or dry. If fed wet, only enough moisture (either milk or water) should be added to make the feed crumbly, but in no sense sloppy. When this growing mash or mixture is not used, a hopper containing bran should be accessible to the chickens at all times. After the chickens are two months old they may be fed four times daily with good results. After they are three months old three feedings a day are enough.

When one has only a few chickens it is less trouble to purchase prepared chick feeds, but where a considerable number are reared it is sometimes cheaper to buy the finely cracked grains and mix together. Some chick feeds contain a large quantity of grit, and may contain grains of poor quality, so that they should be carefully examined and guaranty as to quality secured before purchase.

As soon as the chickens will eat the whole wheat which is usually in about eight weeks, cracked corn and other grains, the small-sized chick feed can be eliminated. In addition to the above feeds the chickens' growth can be hastened if they are given sour milk, skim milk, or buttermilk to drink. Growing chickens kept on a good range may be given all their feed in a hopper, mixing 2 parts by weight of cracked corn with 1 part of wheat, or equal parts of cracked corn, wheat, and oats in one hopper and the dry mash for chickens in another. The beef scrap may be left out of the dry mash and fed in a separate hopper, so that the chickens can eat all of this feed they desire. If the beef scrap is to be fed separately it is advisable to wait until the chicks are 10 days old, although some poultrymen put the beef scrap before the young chickens at the start without bad results.

Chickens confined to small yards should always be supplied with green feed, such as lettuce, sprouted oats, alfalfa, or clover, but the best place to raise chickens successfully is on a good range where no extra green feed is required. Where the chickens are kept in small bare yards, fine charcoal, grit, and oyster shell should be kept before the chickens all of the time, and cracked or ground bone may be fed. The bone is not necessary for chickens that have a good range.

LOSSES IN CHICKS DUE TO DIARRHOEA

By observing the methods of correct poultry raising, the loss from diarrhoea in little chicks can be greatly reduced. Ninety-five per cent. of the diarrhoea is not due to the white diarrhoea germ but to other causes. Among them are the following:

A little chick is apt to become chilled, which will cause it to have diarrhoea. This chilling may result from indiscreet use of the nursery tray of the incubator. For instance, one poultry raiser said that the nursery tray of his machine was registering 80 degrees, or 23 degrees below the egg tray. If newly-hatched chicks were put in a temperature of 80 degrees they would become chilled and diarrhoea probably would follow.

Again, many are careless in transferring chicks from incubator to brooder in a cool room and they fail to warm the container which the chicks are to occupy. The hands should be warm and the cloths with which the chicks are covered should also be warm. After they are placed in the brooder, every precaution should also be taken to keep them warm. The brooder should be kept at a temperature of 95 to 100 degrees the first week and reduced about one degree a day until the right temperature is reached. They should be kept warm enough so that they do not crowd at night and they should always be afforded a cool place to which they may go if they desire. Chicks raised with the hen should not be let out until the grass has become dry because a wet chick is apt to become chilled.

Another cause of diarrhoea is the overheated incubator or brooder which may interfere with the natural absorption of the yolk and cause trouble after the chicks are about a week old. Then, too, diarrhoea may be caused by feeding chicks musty or sour food. Corn meal which has become heated in the sack or bin and which has a musty odor should never be used for chick feeding.

Diarrhoea may also be caused by allowing the chicks to scratch in musty chaff. If this occurs, spores will become imbedded in the lungs of the chick and a white diarrhoea with high mortality will result.

In some cases, diarrhoea may be caused by the white diarrhoea germ which is said to be present in the ovary of the mother hen and, if this is the case, extreme sanitary precautions should be observed. Care should be taken to use only the most vigorous breeding stock available. The incubator should be cleaned and disinfected between every hatch and the brooder should be disinfected every time a chick dies. The incubator door should be darkened at hatching so that healthy chicks will not pick up the droppings of diseased chicks. The drinking water should be colored a claret red by the use of potassium permanganate and the chicks should be fed sour skim milk as soon as they begin to drink.

DO AS YOUR OWN JUDGMENT DICTATES

Your judgment says: "Take a Course in Business now. It is the best thing to do." You hear the command and yet hesitate. When you think of it, IT IS NOT AT ALL FLATTERING TO YOUR SELF-RESPECT TO DODGE THE DICTATES OF YOUR GOOD JUDGMENT.

Increased salary, multiplied opportunities mean independence, high standing in the community, the possession of more than ordinary luxuries, the chance to do things for yourself and for others.

Respect your judgment. Be fair to yourself. Start Now.

FREDERICTON, - - N. B.

STOVE BROODERS IN SUMMER

We have found the stove brooder more difficult to manage in the summer than in the early spring because of thedanger of overheating. We remove the curtains on the sides of the metal deflector and allow the chicks to choose the place which is just warm enough for their comfort. Often they will sleep in a ring at least one foot from the deflector on warm nights.

It is often difficult to keep the fire burning all day when it is checked down to the limit. We burn the stoves with the fire box only about half full of coal so that we can see the live coals. Then if the fire goes out it takes little time to clean out the fire box and build it again.

Frequently on warm summer days it pays to let the fire go out and then build it again about the middle of the afternoon. An inspection of the stoves is again in order after the chicks go to bed, and then everything will be all right until the next morning.

One advantage of the stove brooders is the ease of furnishing ventilation, and this is very important in the summer. The brooders can easily be regulated without a thermometer after some experience. We simply test the temperature by feeling with the hand and the chicks finish the necessary regulation by resting at the point from the stove which is the most comfortable.—R. G. Kirby.

POULTRY DISEASE INVESTIGATOR

Experimental Farms Note.

It will be of interest to poultry keepers throughout Canada to know that there is now an expert who devotes all his time investigating the diseases of poultry. Dr. A. B. Wickware, Assistant Pathologist to the Health of Animals Branch has been assigned to that work by Dr. Torrance, Veterinary Director General.

Dr. Wickware is by no means a novice in poultry diseases. For several years, under Dr. Higgins, Dominion Pathologist, he has devoted some of his time to the diseases affecting poultry and has given special attention to Black Head. Realizing the importance of investigations in poultry diseases, Mr. J. H. Grisdale, Director of Experimental Farms and Dr. Torrance arranged for Dr. Wickware to take up this question exclusively. He is therefore now co-operating with the Poultry Division, Central Experimental Farm, where, since last fall, he has been conducting experiments along this much needed and very important line of work.

Continued attention is being given to Black Head in turkeys and many new investigations are being started. These relate to chick diseases as well as to general diseases of poultry, including parasites of all kinds.

The annual losses that occur from poultry diseases and parasites are tremendous. No person knows what the amount is but it is well into the millions of dollars each year. Dr. Wickware's work will no doubt, do something to eliminate part of this, but the co-operation of all poultrymen who have any disease in their flock will be appreciated.

As usual, communications to the Experimental Farm re diseases of poultry will be welcomed and with Dr. Wickware now giving all his time to this matter, even more information will be available. Specimens of sick birds should be sent when practicable and may be expressed collect if addressed to Biological Laboratory, Experimental Farm, Ottawa.

BREAKING UP BROODY HENS

I make a coop of slats or wire netting, leaving it as open as possible, but just so the hens cannot fall through. Make the coop large enough to accommodate seven or eight hens. Hang it to the limb of a tree or set it off the ground outdoors so that the air can circulate around and under them, and so that the wind can swing them. If there is nothing under them so they can keep warm the setting fever is soon cooled out of them.

Don't feed them, and have the coop placed so that the hens can see the other hens enjoying their feed and freedom and that will increase their longing for liberty. Three days in this prison will break up most any old hen.

I have three of these coops and each evening I shut up the hens that want to set. I let those out that have been in three days, and by having three coops I can use them in rotation. I have some to let out each evening and can use the empty coop for the new ones. By taking a hen the first day she wants to set she is much easier broken up.—Mrs. M. Emrick.

(Editor's Note—This is a very effective plan and will quickly break up any hen. It is pretty tough on the hens to keep them for three days without food and water and this part of the treatment does more harm than good. I find it much better to give all the water they want and feed lightly on oats, barley or mash twice a day).

Goslings at first should be fed a mash of two parts shorts and one part corn meal. At the end of three weeks change to equal parts shorts and corn meal with 5% each of beef scraps and grit.

With eggs going into storage at 35 to 40 cents a dozen it is a pretty sure gamble that it will pay any farmer to raise a good flock of pullets. Feed them the best you know how and do not skimp on grain if you would get best returns for time and feed invested, for a poor pullet is of little value.

The Real Asphalt Roofing

Don't confuse Paroid with ordinary ready roofings. Paroid has the record of 19 years of proven service and is the choice of farmers, and is used on Government Military Camp Buildings.

NEPONSET Paroid ROOFING

Insist on the Genuine Paroid and your roofs will be weather-proof and fire-resisting; your buildings will be warmer in winter.

Paroid has the Grey surface. Also made with crushed slate surface, Red and Green. Complete kit and unconditional guarantee with each roll; it is the easiest of all roofings to lay. The Neponset dealer is a man worth dealing with.

THE HORSE

PREPARING FARM HORSES FOR SUMMER WORK

Too much stress cannot be laid upon the oft-repeated statement that increased production of crops on every Canadian farm is not only an economic necessity but also the patriotic duty of every Canadian farmer.

One of the most important requisites of increased production is the employment of cheap and sufficient motive power. The horse being the principal motive power on the farm must in consequence perform more work than ever before, and his preparation therefore at this season is a most important subject.

Horses can be maintained profitably on the farm only if producing cheap motive power or producing marketable foals. The cheapness of horse labour must be measured by the work done in proportion to money invested and feed consumed.

As a producer of power the horse competes with farm engines of all kinds, and should be rated accordingly. As with the engine so with the horse, the main requisites of cheap power production are sufficient weight and strength to perform the regular work easily and, when necessary, carry a fair overload for a short time, quality of construction ensuring durability and a capacity to consume sufficient fuel (feed- to generate all the power that is possible. As also with the engine, the thorough fitting of the horse for work will ensure the production of more power at less cost.

Development of Horse-Power

The power developed by a horse of the right type is made up entirely of the energy contained in his daily feed plus the reserve energy (stored fat and muscle) of the body. The storage of energy in the horse in this way is therefore advisable as preparing him for that time when most work is required. The possible available energy in the way of horse-power from a pound of oats is 425 units of power, and from a pound of timothy hay is 150 units of power, while one pound of wheat straw contains no available power, since the energy contained is less than the amount used by the horse to digest it. It is clear, therefore, that the energy must be contained in the feed and it must be in a readily available form.

For the average 1,500-pound horse at hard steady work a ration of 20 pounds oats and 15 pounds good hay produces about 11,000 units of power, which is about the work such a horse is capable of performing.

As the labour becomes heavier, so in the same proportion the food digested is diminished. Very severe work prevents digestion of food from 7 to 25 per cent. Hence, either more feed must be consumed by the horse or the reserve power of the body must be drawn upon to meet this extra demand. As an example of how extraordinary strain may interfere with digestion, it has been proven that the trotting of heavy horses even with a light load requires from one-half to four-fifths more feed per mile covered than when walking.

The heavy horse produces the most power for feed consumed when drawing a load at the rate of two and one-half miles per hour.

More horses, heavier horses, horses better prepared for work and fed for work will go far toward increasing and cheapening production per acre or per ton of crop. With the shortage of farm help at the present time, more and better horses will enable fewer men, when using larger and better farm implements, to maintain or ever increase production at a decreased cost.

Feeding in Preparation for Hard Work

Rest and fat are always the greatest enemies of the horse. Feeding in preparation for heavy summer work after an idle winter requires care and skill. Horses fattened during the winter are in poorer condition for hard summer work than horses kept on a good maintenance ration. The soft horse withstands heavy labour and the heat of summer very poorly.

The preparation of all horses for summer work should commence at once. Horses which are yet on a maintenance ration of rough feeds should now receive a medium grain ration and better quality roughage (preferably timothy) in increasing quantities until up to a full working ration at the commencement of the hard spring work. By the middle of March the horse should be on regular light work or at least regular exercise and a grain ration of from 10 to 12 pounds daily, divided into three feeds. At the commencement of the heavy spring work he should receive from 1 to 1¼ pounds of grain per 100 pounds of live weight. For example, a 1,500-pound horse should at that time receive from 15 to 19 pounds of grain and 15 pounds of hay daily. The best method of feeding is as follows:—

5 a. m. 6 pounds grain mixture, 5 pounds hay.

12 a. m. 6 pounds grain mixture, 3 pounds hay.

6 p. m. 4 pounds grain mixture, 8 pounds hay.

When the horses are idle for a day or so only, reduce the grain one-half.

Regularity in feeding and uniformity of feeds, both as to quantity and quality, are essential. Grain mixtures, such as oats 5 parts, bran 1 part; or oats 3 parts and barley 1 part will be found satisfactory.

One or more feeds of warm mashes per week are essential to prepare or maintain a working horse. A bran mash replacing the Saturday night grain is excellent. This might be replaced by boiled barley or other grains mixed with bran, and fed warm. If desired, saltpetre may be added as a blood tonic, and molasses as an extra laxative and appetizer.

Salt in the rock form should be in the horse manger at all times.

Watering the Horses

Water should always be given freely provided it is given frequently. Experience has proven that horses should be at liberty to drink both before and after feeding, but the larger supply should be previous to feeding.

Changes in Feeds

All changes in feed and work must be made gradually. If not, there is danger of colic, lymphangitis, and similar derangements. Gradual changes not only build up the muscles and energy of the horse but gradually strengthen the digestion in preparation for the heavy strain on these organs during the heavy work.

Clipping and Grooming

Clipping the horse in the spring when shedding commences will save much discomfort to the horse and much feed, and may also prevent overheating with resultant chills, colic, etc. Thorough grooming during the heavy working season will save feed and will increase the health, vigour, and power of the horse.

Harness and Shoulders

Many horses, especially young horses, are troubled with sore shoulders in spring. The preparation of harness and the fitting of collars will prevent this trouble. Clean the harness, fit the collar properly, and pay particular attention to cleaning collar pads and pounding them smooth. A careful daily washing of shoulders and withers with cold water or, better, cold salt water, will cleanse and toughen the skin in preparation for the severe work of warm weather. This washing should be continued from two to four weeks, depending on the age of the horse and the condition of the shoulders.

Caring of the Teeth

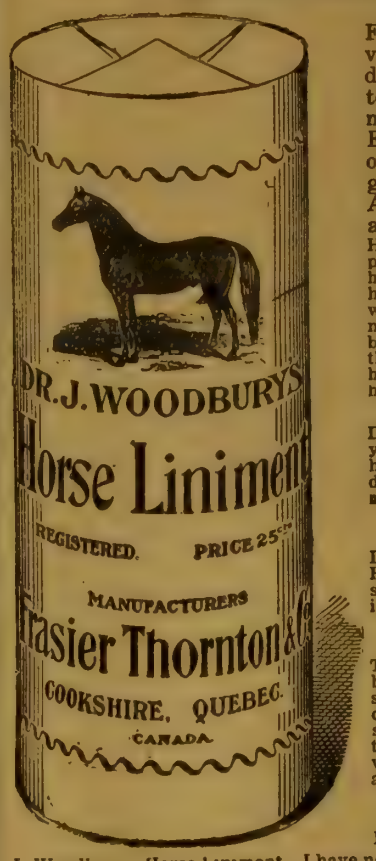
Owing to sharp corner and unevenness of the molars, many horses fail to properly masticate and digest their food. Have a good veterinarian or other experienced horseman examine the mouths carefully and file or "float" the teeth into normal condition. By so doing, much feed and horse energy will be saved.

Caring for Feet

Much valuable time and horse labour is lost annually by carelessness in attending to the trimming and shoeing of the feet of the horse. When the horse remains unshod throughout the entire year, care must be taken to keep the wearing surfaces smooth and even. When shoeing is necessary, particular attention must be paid to

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

BUTTER PARCHMENT
Printed or Plain, at the Maritime Farmer Office

the frequency and correctness of trimming and shoeing. Improper care of the feet is largely responsible for much unsoundness and also for much torture to the horse, with the resulting loss of power.

Parasites

External and internal parasites, such as lice and worms, may cause the loss of 25 to 50 per cent of feed and horse-power. Rid the animals and stables of these pests. A few cheap window and door screens will do much to give comfort to the horses, not only in the keeping ut of flies but also in the providing of good stable ventilation during the summer months.—By E. S. Archibald, B.A., B.S.A., Dominion Animal Husbandman.

THE BROOD MARE AND HER FOAL

There are no animals about the farm that are so apt to be so badly used as the brood mare and her little colt. Humane treatment is the natural religion and duty of the farmer to all animal life on the farm. Also, if he desires a margin of profit from their keep and work he must use them humanely. It is not that farmers as a general rule mean to be cruel, but there is too often to be witnessed cases of careless attention to the mare and her colt, that suggest a lack of thoughtfulness.

A mare that is nursing a colt requires more attention than a dry mare, but they often have to take their place in the team alongside other horses, and are subjected to the same amount of work. "It does not pay to rear horses," is the verdict of the average farmer, and therefore h the average farmer, and therefore he still persists in pursuing the methods that place profitable horse rearing further and further away from the industry. It will be far better for a farmer to leave horse breeding and rearing alone, than to treat it as a nuisance. It is this policy that is keeping the horse industry in Canada at such a low ebb.

There are more colts dwarfed and mares injured by the dam being worked hard while suckling the colt than at any other time and by all other means whatever. She is then weak, liable to become overheated, and any disability experienced by the mare will surely be participated in by the foal. By taking a few sensible precautions in handling the brood mare before and after foaling, she may be made almost as useful from the standpoint of labor performed as the gelding or mare that raises no colt. As a rule when a mare has been worked hard and regularly up to the time she drops her colt, a holiday of two weeks, if at all possible, should be given her, before she again resumes avtive duties. The feeding during the holiday should commence with a reduced ration and gradually increased to the usual heavy ration. Of course is must be remembered that the mare that is carrying a colt must be better fed in the winter months previous to foaling, than the mare that carries no colt. And then again in spring and summer foaling, enough feed is necessary above the amount to support the work. Milk cannot be made from nothing.

When it comes time to put her back into harness, leave the foal in the box stall when she is taken out to work. He will fret at first, but he will soon get accustomed to doing without his mother. The customary practice of allowing the colt to run alongside the dam at work is nothing short of criminal. In its wanderings on the field after its mother it is doing proportionately more labor than the team, wasting all the tissue that builds up growth and conformation. This practice is responsible for many of the ailments that afflict their after life, and checks any development where selection of parents or care in breeding would have succeeded. Farmers who practice this argue that the foal gets a regular supply of milk, but they forget that the foal spends the extra milk in the exertions that he has to overcome in following the dam in her regular work. Also the colt has no opportunity to feed on anything extra. It goes without saying that some special attention should be given to the foal, and an ideal opportunity is afforded to do this when the little fellow is kept in the box stall. By putting grain into his mouth so that he gets the taste of it, he will soon get into the way of i. If one can get a reasonable amount of colt flesh on during the first month there is no reason why it cannot be maintained by a system of grain feeding even though the mare be put to hard work.

Many persons suppose that a colt needs no water. Nothing could be further from the truth. After it is a week old, the colt should be offered water once a day, at noon, and as it increases in age oftener each day. She will be soft and worry greatly, probably heating herself up quite badly. Beginning with half a day in this fashion, she may be gradually toughened back into doing her full share of the regular team work. A good plan, when the mare is excited and heated, when she comes in at noon, is to take some milk from her and then put her in a stall in the work stable to eat a little hay and cool off. After she has cooled off so she may be watered she may be taken to the box stall, turned in with the foal and fed her grain. Never let a foal suck milk from a warm mare. It sets up indigestion and starts scours. Always keep a bucket of water in the bo xstall so that the foal may take a drink whenever he wants it.

Another plan in working the mare with a young colt sucking her, that is adopted where the two weeks' holiday for the mare is impossible and where it is a necessity to work her a few days after foaling, is to divide the

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

WOMEN'S RESPONSIBILITIES OF TO-DAY

An address delivered by Miss Winter at a mass meeting held in St. John, in the Opera House, April 13, under the auspices of the St. John Housewives' League.

In these days of organizations for the purpose of cutting down expenses, days of close calculation of cost, when everything is reduced to a money basis in production, it is not surprising that discussion should have arisen over the great waste involved in the past and which to-day's WORLD CRISIS demands that we **should** and **must** give our whole-hearted attention to.

Almost in the same breath we hear the words **thrift, production, patriotism,** and so closely are they connected we might rightly consider one to be a synonym of the other.

The cost of living has soared by leaps and bounds, until at the present time it is not the increase in the cost of those foods which are classed as **luxuries** that bother the consumer, but it is the fact that the cost of the **plain necessaries** of life have made such rapid strides that providing for the wants of the family has become a serious problem.

Undoubtedly, the shortage in our own field and garden crops and the heavy demands for overseas consumption has resulted in a decreased supply for home use. Canada has sent between three and four hundred thousand men to the front and these men having been taken from the work of **production** are now engaged in the work of **destruction.** The producers are now the consumers. For these reasons it is the **duty** of every person to **produce** more and **save** more.

The individual has a responsibility in this thrift-production move, but by organized effort much more can be accomplished, thus the formation of Leagues, Women's Emergency Corps, Garden Clubs, and the united interest and co-operation of existing societies in reducing the cost of living.

I do not know if the aims and objects of Housewives' Leagues the Dominion over are entirely the same, but I do know that the reason for the formation of the one in your city has a very worthy object. If I may be permitted to do so, I am going to quote the aims: "Organized to secure the co-operation of the housewives of Saint John in encouraging thrift, promoting economy, putting the home on a business basis, studying to acquire the best method of buying and utilizing foodstuffs, and generally to work unitedly along the lines of preparedness for the harder times and higher prices in sight."

Keeping in mind these worthy objects, I shall endeavor to show by example and precept what the women working individually and collectively can accomplish for our Province, the Dominion and the British Empire.

Encouraging Thrift

The American Cookery Magazine, in its editorial pages for March, says, "the man of thrift **earns** largely, **plans** carefully, **manages** economically, **spends** wisely, and **saves** consistently. Thrift is all frugality, prudence, economy and industry,—and then some."

The Agricultural War Book for 1916 tells us that "Extravagance, always a folly, in these days becomes a crime; thrift, always a virtue, in these days becomes a national duty." Thrift means a system under which **all** can thrive,—not a system of senseless luxury and ambitions display for some, and of grinding poverty and hardship for others. We must all, every man, woman and child, feel **personally** responsible, and when we waken to that fact the sooner will we enjoy the blessings of peace.

Promoting Economy.

The cost of food means half the cost a family thinks she is economizing by of living, and the great problem of the housekeeper of to-day is to prepare the most nutritious dishes at the least cost.

A thoughtless provider of food for limiting the variety of her supplies. This is a grave error, as health **demands** a varied diet. Food must be selected to secure nutrition, energy, stimulation and indigestible waste products.

Among the Japanese, says the Youth's Companion, thrift is a virtue in high esteem. Two old misers of Tokyo were one day discussing ways and means of saving.

"I manage to make a fan last about twenty years," said one. "I don't open the whole fan wastefully and wave it carelessly about. I open only one section at a time. That is good for about a year. Then I open the next, and so on until the fan is used up."

"Twenty years for a good fan!" exclaimed the other. "What sinful extravagance! In my family we use a fan for two or three generations and this is how we do it: We open the whole fan but we don't wear it out by waving it. We hold it still, like this, under our nose, and wave our faces!"

This is merely to illustrate that very often the manner in whih some people go about it to practise economy, lacks judgment and they are doing more harm than good. There are many ways, however, in which we can **wisely** economize in order to reduce the food bill and the cost of living in general, but I have grouped what I think to be the most **practical** ways.

Fuel.

1st. Count Rumford says, "More fuel is frequently consumed in a kitchen range to boil a tea-kettle than with proper management would be sufficient to cook a dinner for fifty men." Therefore, keep an eye on the stove, close the drafts when not in use, and **save your fuel.**

Poorly Cooked Foods.

2nd. When the stove is in use, take heed to the cooking. Frequently one-half of the food is wasted on account of badly constructed ovens and lack of knowledge as to the temperature at which food should be cooked. Usually more heat is applied than is necessary.

Cooking Excessive Quantities

3rd. Do not cook more than is needed. Try to make the dishes served of such size that there will be enough to satisfy the appetite of the family and no unnecessary table or plate waste. Really, "left-over" materials should be avoided, but whatever is left over should be covered, when cold, and kept in a good condition until used.

Non-nutritive Foods.

4th. Do not buy materials that are of small nutritive value. Remember that, except in the case of milk for children, the amount needed of foods specially useful for body-building purposes, that is, meats and meat-substitutes, fruits and vegetables, is not large, but what is needed, is needed very much.

Foods Out of Season

5th. Do not buy foods that are out of season and consequently high priced, e. g., spring lamb, broiling chickens, early strawberries, early vegetables, etc. The prices of these lower as the season advances. Wait until our **native** products are plentiful and **then** buy.

Use Less of Staple Foods

6th. Notice carefully how much of such staples as flour, sugar, milk, eggs, butter, etc., are used each week for a month, and see if there are any ways of cutting down the quantity consumed.

Buy Nonperishable Materials in Quantities

7th. Buy nonperishable materials in quantities if better prices can be secured and there is a good storage place in the home. Neighbors can sometimes club together to get lower rates.

Foods Thrown in Garbage Can

8th. Do not be above noticing whether anything usable is thrown away with the garbage which always shows how thriftily food is used in a household, e. g., "cut-offs" from vegetables, "peelings" from apples, "trimmings" from meat. Boil potatoes with the skins on, then nothing will be lost in peeling.

"Finicky" Tastes in Food.

9th. "Finicky" tastes in food often prevent the use of many valuable materials which might be the means of saving money, e.g., rice, a substitute for potatoes; cheese' a substitute for meat. Corn meal is rich in both fats and proteids. Buckwheat contains nearly the same nutritive properties as wheat and they are only slightly less in amount. Both should occur more frequently in the diet.

Good Food Habits

10th. Good food habits are an important part of personal hygiene and thrift. Children get such habits by having suitable amounts of suitable foods served to them and then being expected to eat what is set before them.

Tells Just What They Did For Her

WELL KNOWN LADY MAKES A STATEMENT REGARDING DODD'S KIDNEY PILLS

She Had Numerous Troubles, All of Which Came From Diseased Kidneys and Found a Cure in Dodd's Kidney Pills.

Ayre's Cliff, Que, May 21st—(Special).—Mrs. W. Coules Macdona, of The Farm, a member of one of the oldest families living in this neighborhood has consented to give the public the benefit of her experience with Dodd's Kidney Pills.

"My trouble started from overwork," Mrs. Macdona states, "and I suffered for two years. I was treated by a doctor, but the results were not satisfactory. My joints were stiff, I had cramps in my muscles, my sleep was broken and unrefreshing and I was heavy and sleepy after meals. I had bad headaches, my appetite was fitful and I was always tired and nervous. I was depressed and low-spirited, I had a bitter taste in my mouth in the mornings and I was often dizzy.

"I perspired with the least exertion and I often had sharp pressure or pain on the top of the head. Then rheumatism was added to my troubles. I have taken just two boxes of Dodd's Kidney Pills and they have done me good, not only in one way, but in many. Even my rheumatism is much better."

Mrs. Macdona's symptoms all showed that her kidneys were wrong. If you have similar symptoms try Dodd's Kidney Pills.

MAGIC BAKING POWDER

WINNIPEG TORONTO, ONT. MONTREAL

YOUNG WOMEN MAY AVOID PAIN

Need Only Trust to Lydia E. Pinkham's Vegetable Compound, says Mrs. Kurtzweg.

Buffalo, N.Y.—"My daughter, whose picture is herewith, was much troubled with pains in her back and sides every month and they would sometimes be so bad that it would seem like acute inflammation of some organ. She read your advertisement in the newspapers and tried Lydia E. Pinkham's Vegetable Compound. She praises it highly as she has been relieved of all these pains by its use. All mothers should know of this remedy, and all young girls who suffer should try it."—Mrs. MATILDA KURTZWEG, 529 High St., Buffalo, N. Y.

Young women who are troubled with painful or irregular periods, backache, headache, dragging-down sensations, fainting spells or indigestion, should take Lydia E. Pinkham's Vegetable Compound. Thousands have been restored to health by this root and herb remedy.

If you know of any young woman who is sick and needs helpful advice, ask her to write to the Lydia E. Pinkham Medicine Co., Lynn, Mass. Only women will receive her letter, and it will be held in strictest confidence.

Eating More Than Necessary

11th. Don't eat more than necessary and don't eat between meals. Perhaps this clipping I took from a magazine entitled "The Diet Deliberate" will encourage less eating:—

"Somewhat less speedily,
Somewhat less greedily,
Grind every bite to a superfine pulp.
Don't be a glutton and burst every button;
Don't bolt your meals at an orgre-like gulp.
In the war on high prices, the latest advice is,
To masticate slowly your bread and your meat,
To practise economy in your gastronomy
The longer you chew things the less you will eat!"

Save the Light Bill.

12th. Be saving on the light bill. Take heed that lights are turned off when occupants have gone out of the rooms. The use of mantels on gas jets and especially filament lamps on the electric current increases the efficiency of the light greatly and decreases the amount of expense.

Weigh Groceries

13th. Weigh your groceries and be on the alert for little leaks. Have correct scales in the kitchen and every parcel purchased by weight should be put thereon and weighed before the delivery boy leaves. Did you ever stop to consider that a shortage of a quarter of a pound of meat at 20 cts means 5 cts? If this should occur 20 times in a month, it means $1.00 and in a year $12.00. In many homes the order slip is not checked up with the goods delivered. This is not always the fault of the grocery man. Frequently careless help deliver packages at the wrong places.

Shop Personally

14th. Shop personally. It is no disgrace to do your own marketing. The former Mrs. Galt, an excellent cook, exceptional housekeeper, and an intelligent marketer, always did her marketing in person until the day of the announcement of her engagement to President Wilson.

The woman who depends on the telephone to do her buying is not likely to receive as careful service as though she went in person to select her supplies. Possibly some have no help and find it inconvenient to go out, but supplies for the following day can be ordered in the afternoon, in fact supplies enough to last for several days can be purchased in one trip.

Go to the market or the store and let the people you trade with know of your tastes and that you are a discriminating buyer who knows what you want and insist on having.

Buy Canadian-grown and Manufactured Goods.

15th. When you cannot purchase New Brunswick grown produce, buy Canadian-grown and Canadian manufactured foods. There are too many imported jams and canned foods on our grocers' shelves. Leave them there and they will disappear.

Cuts of Meat

16th. Acquaint yourself with the various cuts in meat and know their food values. It is well said that "careful marketing depends on careful planning and on the other hand, successful, efficient marketing is based on exact planning." From 25 to 60 cents can be saved on the week's supply of meat if this be bought in bulk and sub-divided into smaller cuts for each day's dinner. Take, for instance, a fore-quarter of lamb, or a shoulder of veal; each will furnish at least three meals of fresh cooked meat, besides "made overs"; the fore-quarter will cut into a shoulder roast, a dish of rib chops, and the neck will boil or stew; the whole will be bought at a relatively low figure, whereas if subdivided and bought separately, the cost of the choice cuts would add at least 25 cts to the total outlay; while in the case of veal, probably an even greater saving will be affected.

There may be two objections to this statement. 1st. Some may disapprove, giving the excuse that such economy dooms a household to a monotonous diet. But this is not so. If one joint be served as a roast, another as a broil, the third as a savoury stew, there will be no complaints of monotony.

2nd. Some may not think it worth while to save 25 cts but, if 25 cts. a week be saved for a year, that means $13. Now, if a calculation of the net gain to the national funds were made if each household in Canada alone thus saved and handed over to the Government, the total proceeds at the end of twelve months, the grand total would be startling.

System in All Things.

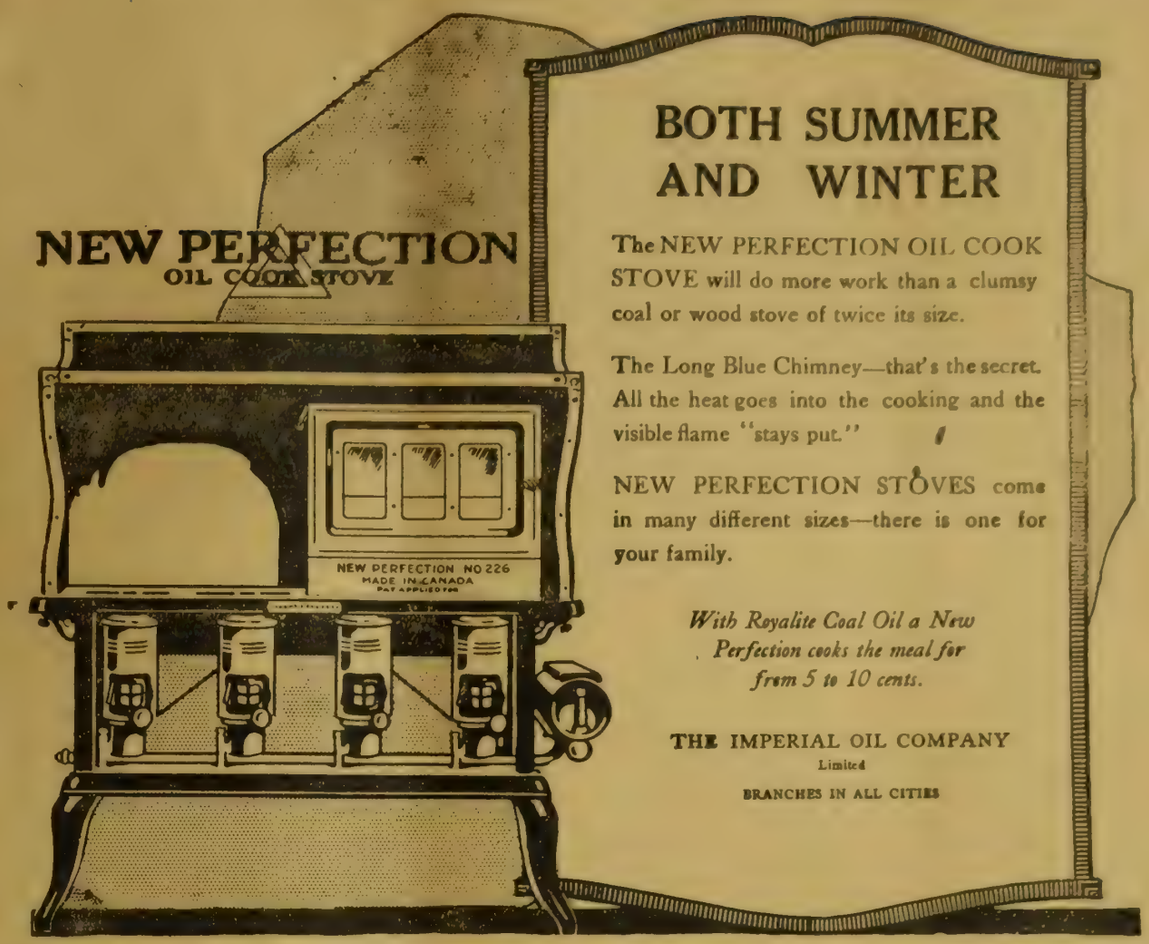
17th. Be systematic in all things, in the saving of time, money and strength. Put yourself on a weekly allowance; keep tabs on every expenditure and cultivate habits of saving. People yet rich in two ways: the minority through skill and success in investments and trading; the majority through systematic saving of small sums.

Patronize Home Industries

18th. Patronize home industries. First, give your local merchants patronage thereby making it easier for them to give you fair prices. Then, if you can't get what you want at home, buy "Made in Canada" goods. Don't rush large orders to Mail Order houses, sending that money out of your own Province. Let it be spent to employ labor at home and make the stores in our own Province more attractive. Just as soon as you give your trade to local merchants, all the more quickly will they be in a position to keep in stock what you need.

Order in Large Quantities

19th. Give large orders once a month, and pay cash for everything you get. Remember that the consumer pays for the time-payments and the



NEW PERFECTION
OIL COOK STOVE
NEW PERFECTION NO 226
MADE IN CANADA
PAT APPLIED FOR
BOTH SUMMER AND WINTER
The NEW PERFECTION OIL COOK STOVE will do more work than a clumsy coal or wood stove of twice its size.
The Long Blue Chimney—that's the secret. All the heat goes into the cooking and the visible flame "stays put."

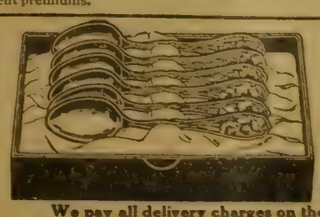
97 Piece Dinner Set and lovely Silverware Given To You

YOU can secure without a penny of cost this magnificent complete 97-piece English Dinner Service and a lovely set of half-dozen Wm. A. Rogers teaspoons. Each dinner service is guaranteed full size for family use, its 97 pieces comprising 12 cups and 12 saucers, 12 tea plates, 12 dinner plates, 12 bread and butter plates, 12 soup plates, 12 sauce dishes, 2 platters, 2 oval covered vegetable dishes, a cream jug, covered sugar bowl, a gravy boat, pickle dish, and a salad bowl. It is handsomely decorated in rich floral design and will surely delight the most fastidious housekeeper. The beautiful set of Teaspoons are in the famous Wm. A. Rogers French Carnation design with French grey handles and brightly polished bowls.

Read our Wonderful Offer

We are determined to establish a national reputation for Dr. Edson's Famous Life Building Blood Tonic and Nerve Pills and are sparing no expense to secure representatives in all parts of Canada who will help us by introducing this famous remedy to their friends and neighbors. That is why we offer to give away these magnificent premiums.



Carnation French Canadian Teaspoons

Genuine Wm. A. Rogers make—the most beautiful pattern ever seen. These magnificent spoons will delight any housekeeper and they are guaranteed to give every satisfaction in wear.

We pay all delivery charges on these Grand Premiums

Will you sell just 12 boxes among your friends at only 25c. per box?

You can easily do this because every one you know will be glad to learn of this grand remedy. It is one of the world's best known proprietary blood and nerve remedies for weak and insane blood, run-down, over-worked, nervous and anaemic. In all run down conditions of the system it will be found a genuine blood builder and revitalizer, and as a general tonic for blood and nerves it has no equal.

Send No Money—Just send your name and address to-day and we will send the 12 boxes postage paid. You will be glad to know that there is a big profit to every purchaser of a box can obtain a beautiful set of genuine Rogers silverware. Then return our premium, only $3.00, and we will promptly send you, all delivery charges paid, the beautiful set of spoons, and the handsome dinner set you have received without selling any more goods for same showing your fine premium among your friends and getting orders of them to sell our goods and earn our fine premiums as you did. We pay all delivery charges right to your door.

REMEMBER YOU TAKE NO RISK. You do not spend a cent of your own money. We trust you with our goods until sold and if for any reason you cannot sell them we will take them back and give you beautiful premiums or pay you a big cash commission on the quantity you do sell. Write to-day if you wish to take advantage of this liberal offer. It gives you the opportunity of a life time. Address

The International Mfg. Co., Dept. D 116 Toronto, Ont.

COULD NOT SWEEP BACK WAS SO SORE.

Women are coming to understand that weak, lame and aching backs from which they suffer so much excruciating pain and agony are due to wrong action of the kidneys.

On the first sign of any weakness in the back Doan's Kidney Pills should be taken.

Mrs. L. Gonshaw, 683 Manning Ave., Toronto, Ont., writes: "I take great pleasure in writing you, stating the benefit I have received by using Doan's Kidney Pills. About three years ago I was terribly afflicted with lame back, and was so bad I could not even sweep the floor. I was advised to use Doan's Kidney Pills, and before I had used one box there was a great improvement, and my back was completely cured. I highly recommend 'Doan's' for lame back."

Doan's Kidney Pills are put up in an oblong grey box, the trade-mark is a Maple Leaf, so accept no other.

Price 50c. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

When ordering, direct specify "Doan's."

daily delivery.

Boycott the Market

20th. When prices are high on certain foods for which there does not seem to be a good reason, boycott the market. The woman citizen represents the greatest consuming and purchasing power. She must be a close observer of the market quotations and she will discover that there is more economy in proper spending than in actual buying. When prices soar, she will control the market by not buying, and prices will drop. She will questions the "below-profit quotations" and fight shy. She will believe in justice and fair deal and will buy when prices are right.

Not long ago a potato dealer from Fredericton went to Boston to sell potatoes and the men he had been in the habit of selling to, refused to buy. He said, although some few weeks ago he could easily sell 75 barrels a day, to-day he could not sell 15, simply because the people refused to buy and were eating rice instead.

A Garden for Every Home

21st. Have a backyard garden How much more palatable are vegetables freshly picked, and as they are so necessary to the diet they may be included in the daily meals more frequently if raised in the home garden. Almost every home has some little spot where vegetables can be grown, and in the preparation of the garden it is such healthful recreation to get close to Mother Earth.

The raising of these appetizing, delicious and nutritious food products helps to lessen the desire for the more expensive kinds of foods. Write to Mr. S. C. Johnston, Vegetable Specialist, Ontario Department of Agriculture for his circular entitled "A Vegetable Garden for Every Home," and to Mr. Arthur Gibson, Chief Assistant Entomologist, Department of Agriculture, Ottawa for Circular 9, "Common Garden Insects and Their Control."

Home Canning

22nd. Do your own canning! People with a garden and the necessary time can greatly lessen the cost of food by canning their own fruits and vegetables, and even if it is impossible to have a garden, by getting in touch with the farmer, native produce can be bought in quantity at a reasonable price for canning. It is by far cheaper than purchasing canned goods, and during the winter and spring months lends a variety to the meals which every member in a household is sure to appreciate. Meats also may be canned to advantage when prices are low. Write to Mr. E. L. Davies, Demonstrator in Bacteriology, Ontario Agricultural College for Bulletin 236, "Home Canning of Fruits and Vegetables." This is a bulletin for free distribution and is very helpful.. Apply to the Women's Institute Division, New Brunswick Department of Agriculture, for a canning demonstration. It is much more practical to actually see a thing done than to merely read how it is done.

Utilizing Vacant Lots

23rd. Make use of vacant lots for vegetable growing. By working unitedly in this respect the women can be prepared to cope with the harder times and higher prices in sight.

Mr. W. T. Macoun, Dominion Horticulturist, Ottawa, has published a most instructive bulletin entitled "Garden Making on Vacant Lots," and the introduction to the bulletin reads as follows:

"The British Empire will need all the food that can be produced in 1917. Canadians can do much, if they will, in increasing the production of vegetables. Everyone in cities and towns with vacant land should consider sreiously whether they can utilize it for the growing of some kind of vegetable. By growing vegetables for one's home use, this food, which would otherwise have been bought, will be available for some one else. If $25.00 is saved in the food account, one will even more cheerfully contribute to the relief of those suffering for lack of food."

As an association you should materially increase the food supply in this direction and with the assistance of the young people, especially the Girl Guides and Boy Scouts, the results in the Fall should be very gratifying.

The leaflet gives detailed information as to the results obtained in Toronto, Ottawa, Regin and Calgary. Write for Mr. Macoun's bulletin and interest the various organizations in the city in a production campaign.

Conversation with a Merchant.

To get nearer to the bottom of this subject on reducing the high cost of living, I am going to tell you of a conversation I had with a groceryman the other day.

I asked him, as a merchant, to tell me frankly what the consumer could do to lower the cost of food. He said, "Miss Winter, the prices are bound to advance and in certain lines of food little can be done to lower the prices. It is not the middlemen who should receive investigation but the manufacturers. Take, for instance, fine salt. There are two manufacturers in Canada who control the sale of fine salt. They set their price and the wholesale dealer must sell to the retail merchant at the price dictated by the manufacturers."

"Now," said the grocer, "I gave an order for fine salt not long ago. Up to the present time customers have been paying 5cts a bag, but when I figured out what I had paid the wholesale dealer, I came to the conclusion I could not afford to sell it at 5cts a bag again. The manufacturers are to blame for this, but whether or not they raised their prices when it was not necessary, I am not in a position to say."

Law Against Combines

The Dominion Government has overcome (?) the difficulty of large manufacturing concerns organizing combines. All corporations in doing business in Canada are taxed on the excess profits above a certain percentage for war purposes and recently laws were made against any combine in prices.

Difficulties of Merchants

It is my opinion the retail merchant has to suffer about as much as the consumer. If one goes to a store and purchases, say a pound of butter at 45cts, for which the merchant paid to the farmer 40cts, he is only making a little over ten per cent. profit, if the customer pays for it. The merchant is bound to pay cash to the farmer for the produce he buys. A farmer is very reluctant at exchanging his products for groceries (no doubt because he wishes to be loyal to that little grocery store in his own community), and yet how long the merchant has to wait for his pay from customers.

Suppose the merchant has a large order coming in from the wholesale dealer. He must pay for that within thirty days and if not, for each day over thirty he has to pay seven per cent.

We go to the store and purchase this thing and that, with every intention of paying our bills at the end of the month, but frequently we let them run into the second month and even longer. The merchant has to pay cash for his orders as well as carrying along the bulk of his customers.

Now, do you not think that if we paid cash for all we bought we would be getting closer to the roots of practically everything to lower the cost of living, This, as all merchants will tell you, is one of the secrets of cheaper living.

Pledge of British Columbia Consumers' League

I do not know, if, when joining your Housewives' League, each member is asked to take a pledge, but this is the pledge of the British Columbia Consumers' League, and I think if you had just such a pledge it would make your work much more effective:

"Realizing the importance of promoting the industrial and Agricultur-

Believes She Was Saved From Srtoke of Paralysis

All One Side Was Cold and Powerless When She Began Using Dr. Chase's Nerve Food.

A dead nerve cell can never be replaced. In this way it is different to other cells of the human body. But feeble, wasted nerve cells can be retored, and herein lies hope.

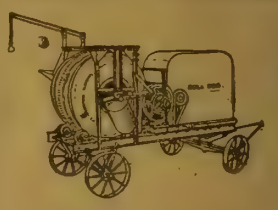
In this fact is also a warning to take notice of such symptoms as sleeplessness and loss of energy and ambition, and restore the vitality to the nervous system before some form of helplessness results.

Nervous prostration, locomotor ataria and paralysis are the natural results of neglecting to keep the nerves in healthful condition. The use of Dr. Chaes's Nerve Food when you suspect there is something wrong, will soon restore vitality to the nervous system, and thereby prevent serious developments.

Mrs. Merritt Nichols, R. R. No. 3, Dundalk, Ont., writes: "I take pleasure in writing to tell you the great benefit I have derived from the use of Dr. Chase's Nerve Food. I was so nervous I could not sleep, and found it hard to get my work done at all, but, having no help at the time, had to do the best I could. Finally my left arm became powerless and cold, and this continued to get worse until my whole side was affected, head and all. I decided to try Dr. Chase's Nerve Food, and the first box helped me so much that I used several, and believe that this treatment saved me from having a paralytic stroke. It has built me up wonderfully, and I can recommend it most heartily, believing that if more Nerve Food were used there would be less sickness."

Dr. Chase's Nerve Food cures in nature's way by nourishing the feeble, wasted nerves back to health and vigor. Fifty cents a box, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

"BULL DOG"
London Concrete Mixer



Capacity 50 cu. yards per day. Price $325.00 complete with gasoline engine. Pays for itself in 20 days' use. Built to last a life time. Send for catalog No. 1 B.

SLEEPING CAR

CANADIAN GOVERNMENT RYS.

A thorough Sleeping Car between Halifax and Boston is now in operation. Leaving Halifax on the Ocean Limited 7.00 a. m., the car will arrive Moncton 2.00 p. m., daily except Sunday, be transferred to No. 13, leaving Moncton 2.20 p. m., and run through to Boston, arriving there 8.30 a. m. From Boston the car will leave 7.30 p. m. daily except Saturday, arrive Moncton 5.20 p. m. daily except Sunday, be transferred to the Ocean Limited leaving Moncton 6.00 p. m., and arrive Halifax 12.20 a. m.

DON'T PUNISH

the sick child by forcing him to swallow nauseous oils and mixtures. Children dread these remedies, and this leads them to hide the little ills until serious trouble results. Most of childhood's troubles originate in constipation and disorders of the stomach. To correct these conditions you will find nothing better than

Chamberlain's Tablets

One tablet at bedtime will do the work and make your child bright and sunny the following morning. The liver is stimulated, the stomach cleansed and the bowels purified—safely and gently. Little folks appreciate them.

25 cents at all dealers, or from

Chamberlain Medicine Co., Toronto 40

CHAMBERLAIN'S TABLETS

Good for children

al progress of British Columbia and the Empire, I hereby ask to be enrolled as a member of the British Columbia Consumers' League, agreeing to advance the objects of the League by giving preference in purchasing (price and quality being equal) first, to the products of British Columbia; second, to those of Canada; third, to those of the British Empire."

No fee of any kind is connected with signing this pledge, but each member is asked to purchase the British Columbia Consumers' Magazine at a cost of 50cts per year. This magazine is published monthly and the manufacturers and large producers tell of their products and only those firms whose goods are of the highest quality, firms who do not fear to add their name and tradesmark to every article, are allowed advertising space in the League's publication. In the event of any Eastern Canadian or Old Country firm being granted space, readers understand that there is no firm in British Columbia producing that particular line of goods or that the League does not stand by the quality being produced.

Beneath a picture of the Union Jack, hanging in the office of this League, at Vancouver, are these heart-stirring words, "You would fight for it: Will you buy for it?"

As a result of the work done through the Consumers' League, assisted by the Department of Agriculture, stores that are featuring United States produce when they can get local produce, are being to a certain extent ostracized and are beginning to see that it is to their advantage to secure home-grown produce.

Money Spent Outside the Province

One of the discoveries made by this League was that in one year alone, in British Columbia, $5,290,670 worth of imported products from countries other than Canada were brought in, paid for and used. That large sum of money went to enrich other lands, (among them Germany.)

This League has been endeavoring to show the one, sure, common-sense, practical way this woeful waste can be eliminated. It requires little, if any sacrifice; only a certain amount of thoughtfulness and perseverance, by just demanding and insisting upon being supplied with British Columbia grown and manufactured goods. Why, in a little over one year, the League has pledged over 9000 families to buy British Columbia produce to the exclusion of imported articles.

Take our own Province, for instance. If, as a League, you were to find out how much money goes out of our Province that could be spent in it, do you not think the figures would astound us? Then, too, consider the hundreds of acres of fertile land in our Province that lies undeveloped and much of the rich product of cultivated land that lies rotting on the ground. Farm produce brought in to St. John in 1908 from outside the Province for Provincial consumption amounted to $2,750,350. Do you think if statistics were secured, the figures would be larger or smaller at the present time?

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:

Mrs. M. Summers, Box 309 Windsor, Ont.

A MESSAGE TO WOMEN!!

GIRL'S LONG COAT.

By Anabel Worthington.

The same skill in design, similar choice in fabrics and the same nicety of details that mark the coats for women's "superior models" are noticeable in this season's coats for junior girls. As an evidence we illustrate No. 8,096, an exact copy of one seen at an exclusive shop specializing in girls' apparel.

By reason of its deep, wide collar that comes close to being a shoulder cape, its loose panel back, belted sides and straight front it may be classed with the prettiest and smartest of imported models. Without showing any "fussy" feature it is up to date in detail and design and is sure to please any girl and any girl's mother. The sleeve is given a fancy touch in its cuff and may be braid trimmed, or velvet or plush may contribute the full cuff. The collar may be either of self material or fur cloth, unless velvet or plush be chosen.

Bolivia cloth, zibeline, kersey cloth, also wool tweed and wool novelty cloth that is so popular enjoy equal merit. Considering the cost of materials, one will not hesitate to make the coat at home, for to-day's pattern, with illustrated instructions, is simplicity itself.

The coat pattern, No. 8,096, cuts in sizes 8 to 14 years. To make in size 10 requires 3¾ yards of 36 inch material, ⅝ yard of 27 inch material for the collar.

To obtain the pattern send to the office of this publication.

CHILD'S COAT.

By Anabel Worthington.

Age has nothing to do with it when it comes to "coat styles." The designers see no reason why the children's models should not denote the semi-fitted or loose contour that is so well liked by their elders. Even the large novelty collar is a necessity, adaptable, however, for the little lady of fashion.

You see one of the best looking coats of the season when you look at this picture of a small girl's model. It has the required ripple fulness, unbelted to show the straight line effect. It will be following the style to enrich the collar with fur banding, or it may be made of velvet or plush.

The frill finish or a cuff will be correct for the sleeve and the buttons may be covered with material or velvet or plush if it be used in trimming. Bolivia cloth, Kersey and the like are suitable for a practical garment—also corduroy. For dress up, velvet will be smart, although velour and broadcloth make a number of the models displayed. At half the cost of a bought one you can make this from the pattern.

The coat pattern No. 8,085 cuts in sizes 2 to 8 years. To make in size 6 requires 2¾ yards 36 inch material.

To obtain the pattern send to the office of this publication.

Grain for Liquor

I was very much pleased to read in a newspaper of recent issue that in Leeds, England, at the conference there of the independent labor party a resolution was unanimously adopted calling on the Government to prohibit absolutely the use of foodstuffs in the manufacture of alcoholic liquors during the war.

No Government in the British dominions has had the courage to suppress the greatest waste of all wastes, namely, the turning of good foodstuffs into alcoholic liquors, where they are worse than wasted, as far as any real food value is concerned.

Although Lloyd George, has not dared, in the face of public opinion, to deal severely with the situation, if all societies took the stand that the Independent Labor Party of Leeds did, such a law might soon be enforced.

Mark Twain says, "'Tis noble to be good, but 'tis nobler to teach others how to be good,—and easier too." Thus in the work of your League, it is easy to talk, to preach, but if you do not act, you are failures. If you are going to succeed, you must live up to the principles involved in your objects.

Less Spent on Dress, Etc.

There are so many ways in which we women can further save so as to be in a better position to meet the patriotic calls of the day and the more strenuous times ahead.

Let each one ask herself, "Am I willing to make the sacrifice when it comes to doing without a new hat, a new pair of boots (which are as high in price as in length)? Can I make my last summer's suit do for this summer? Am I willing to make the sacrifice when it comes to less entertaining and attending places of amusement?

The other day I asked a gentleman to tell me of one way he thought the cost of living could be reduced and this is what I gathered from his remarks:

The craze for amusements and extravagancies of all kinds, so noticeable before 1914, has been much accentuated by the false prosperity due to large war expenditures and the great amount of money thus put in circulation. If the people of Canada would deny themselves of all unnecessary articles and of all pleasures except those which God furnishes free to all his creatures, an immense amount of labour and raw material now practically wasted would be set free for really necessary purposes, and the cost of living would be substantially reduced.

If the question is always not: "Could we make good use of this?" but, "Can we do without it?" the problem of economy is far on the road to being solved.

A Motto for the League

"Our doubts are traitors and make us lose the good we oft might win by fearing to attempt." Let us unloose the shackles, dear ladies, and so live that we may supply the "silver bullets" which will finally beat the Germans. Let us ever keep before us: It was the money spent by us and our Allies that enabled Germany to make war against us. And to this end let our motto be:

"Our living shall be simple; our saving systematic; our service to the Empire, 'Ready and Willing.'"

God give us WOMEN Patient, brave, earnest, self-sacrificing women. A time like this demands strong minds, great hearts, true faith and ready hands.

FOR REMOVING STAINS

For an Old Stain

Use Javelle water.

Method: If large stain, soak in solution, rinse, boil in cold water. Wash in usual way and leave in sun.

For Mildew Stain

For fresh stain: 1. Lemon Juice and salt. 2. Strong soap-suds. 3. Powdered chalk and soap. 4. Powdered chalk and salt. For old stains use Javelle Water or chloride of lime.

For Fresh Paint Stains

Use benzine, turpentine or alcohol. If on delicate fabric use chloroform or ether. Method: Soak in any of these and rub well. Wash in soap and water. For an old paint stain use equal parts of ammonia and turpentine.

For Varnish Stains

Use equal parts of ammonia and turpentine. Chloroform and alcohol are best.

Fashions Dept.

How to Order Patterns.

Order by number, giving age or measurement as required, and allowing at least ten days to receive pattern. Also state in which issue pattern appeared. If two numbers appear for the one suit, one for coat, the other for skirt, thirty cents must be sent. Address Fashion Department, "The Maritime Farmer, Sussex, N. B. Be sure to sign your name when ordering patterns. Many forget to do this.

Positively no patterns will be sold under 15 cents each, owing to advance in cost of same.

When ordering, please use this form:—

Send the following pattern to:

Name .....

Post Office.....

County .....

Province .....

Number of Pattern.....

Age (if child or misses' pattern).....

Measurement—Waist .....Bust.....

Date of issue in which pattern appeared. .....

"THE STRENGTH OF THE EMPIRE LIES IN THE HOMES OF HER PEOPLE"

"New occasions teach new duties," and this war is fast bringing to a crisis a food famine unless we immediately get down to the business of PRODUCING MORE and SAVING MORE.

That the food famine may be averted, we strongly urge the women of our land and especially organized societies like the Women's Institutes, to don their "thinking caps" and do all in their power for NATIONAL SERVICE.

The individual can do much by preaching and practising, and becoming so enthused in this much needed production campaign that others are bound to "catch" the enthusiastic germ and work with such a will as to give desirable results.

The organization can lighten the task and give it a more cheerful aspect by inviting competition and awarding prizes. If the organization would award prizes for most attractive vegetable gardens or hold Autumn Fairs and give prizes for best grown vegetables; in fact consider it a duty to do anything and everything that will bring about a greater food supply, the sooner will we be enjoying the blessings of peace.

The woman in the home has always done considerable preserving and canning, but this year it is a patriotic demand that her yield be at least double that of former years. She must devise schemes whereby she can preserve the produce of her garden, whether it be by canning, preserving, drying or cold storage. And again the organization has its part to play. Any woman is sure to take a deeper interest in the preservation of food if the works of her hands are to be exhibited and there is a possibility of her carrying off the prize.

It is proposed to give the delegates at the Fifth Annual Convention of the New Brunswick Women's Institutes an opportunity to see the results of women's efforts to save the foods to be used during the next winter and spring. A CANNED EXHIBIT will be an attraction. Liberal prizes will be awarded to the Institutes for best quality of New Brunswick grown canned fruits and vegetables. Particulars as to this exhibit will be forthcoming in the near future.

"Pity 'tis, 'tis true" that this war was needed to bring to light many dormant talents. The war has given woman her opportunity but, alas, the suffering, the misery, the sorrow involved! Would she not willingly have waited until woman's part in the economic development of her country had come as a matter of course? This latent talent should be scattered abroad and the organization should make use of the woman to spread the gospel along all lines of ECONOMY and PRODUCTION. As never before, women should make a study of foods, their composition, selection, combination and preparation, so as to meet the needs of the family without waste of money or material.

The Department of Agriculture is ready and willing to co-operate with any society wishing information along all lines of THRIFT and PRODUCTION, whether it be a canning demonstration, a lecture, or both. In response to a circular as to the nature of a public meeting to be addressed by a Departmental representative, Women's Institutes are asking for talks on Institute work, demonstrations in various lines of cookery, lectures on Women's Responsibilities of To-day, etc. If anything is desired in addition to what has been requested, the Department will meet the wishes of the Institutes, providing same are confined to subjects that stand for NATIONAL SERVICE and requests are to hand by June 15th. In order to comply with these requests the Department is engaging a number of trained workers for the summer and fall months, and every effort will be put forth to meet the needs of these strenuous times.

Let the slogan of the individual and the organization be:

"Our grand business is,
Not to see what lies dimly at a distance,
But to do what lies clearly at hand."

The Women's Institute Division of the Agricultural Department will be glad to furnish further particulars. Communicate with

HAZEL E. WINTER,
Supervisor Women's Institutes,
FREDERICTON,

The Crisis!

Untold sacrifices are being made in defence of the world's liberty, assailed by the Hun, who declares he fights for "existence." Let us not forget that other crisis in which the fate of the dread Liquor Traffic, subdued just now by the necessities of war, is also fighting for existence.

Prohibition must be impregnably fortified ***now*** by means of proper enforcement in readiness for the struggle to come when Prohibition must be finally ratified or lost by the votes of the people in many provinces, including New Brunswick.

Alberta, Saskatchewan, Manitoba, Ontario, Nova Scotia and New Brunswick have adopted Prohibition during the war. Prince Edward Island has enjoyed its benefits since 1901. The great majority of districts in Quebec are "dry." That is the situation to-day, but remember, the crisis comes after the war.

SIR VICTOR HORSELEY AND HEREDITY

"That alcohol affects disastrously the minds and bodies of innocent, unborn children must be the undoubted conclusion of those who weigh the Evidence."

The total value of foodstuffs destroyed by the liquor traffic in 1916 was approximately $4,244,090.22. Add to this the immense waste of transportation facilities, clogged and hindered by carrying the grain to destruction, and again conveying the product of the breweries and distilleries to make precious men less efficient in this solemn hour!

Ontario's Splendid Record

Since September 16, 1916, Ontario has enjoyed good enforcement of Prohibition in all but a few districts. Not the most daring anti-prohibitionist hopes for a return of the curse of the traffic in Ontario. Here are some figures showing results in Ontario's largest cities for the last three months of 1915 and 1916:

ARRESTS FOR DRUNKENNESS

	Under License 1915	Under Prohibition 1916
Toronto	2,908	953
Ottawa	286	234
Hamilton	498	61
London	367	144
Brantford	152	16

Note.—"It will be noted that Ottawa has not much reduction in arrests for drunkenness. It is perhaps strange that it should show any reduction in the drunkenness record, inasmuch as it is separated only by the river from the license city of Hull."—PIONEER, Toronto.

Whether your district be under the new Provincial Prohibitory Law, or under the Canada Temperance Act, help us to arouse the full force of public opinion for vigilant enforcement of province-wide Prohibition.

THE VALUE OF A TRUE FRIEND

Is there anything more valuable, anything that tends to bring out the joy, the true happiness of living, that eases the drudgery of the everyday task, more than friendship? Is there anything that can be cultivated more easily and that will give greater returns for the time and trouble expended?

One who is rich in worldly good, yet lacking in loyal, helpful friendships, is to be pitied indeed. The faith of a true friend is a great stimulus for honest, earnest endeavor. It spurs us on and encourages us to do our best. What failures and disappointments would be met with but for the helpful influence, the encouragement, the well wishes of our best friends! How many of us would give up, despair, lie down and quit but for the stimulating and ennobling qualities of some true friend! How many of us that are misunderstood, are censured,

slandered and become impressed with the notion that things are not worth while, that the endeavor for right living is in vain, when a few words from a true, loyal friend briugs about a complete transformation!

There are in life so many influences that tend to destroy, to wreck out self-confidence, our power of accomplishment, that but for the stimulating effect and encouragement from those near and dear to us, who have our welfare at heart, we would never feel equal to the task, our ambitions would be stifled and killed. Many a youth has within himself dormant, latent etrength and inspiration which would, perhaps, never be brought to life but for the helpful influence, the confidence and encouragement of his best friends. Latent power is often not recognized until brought to light by others.

While the aim of true friendship is helpfulness to others, yet the matter can be overdone, although many are prone to overlook thiJ. The truest and most beneficial help one can get from others is that which makes one stronger and better, and not the material things. The gifts of friendship, sympathy, courage and hope are the divinest of all. It should not be our desire and wish to have our burden lightened, but fresh strength and encouragement to bear the burden and have it delegated for a useful purpose. It is the true friend who helps us to better things and to make us understand ourselves. True friendship is not that which encourages or indulges weakness, but rather that which stimulates it into the power to do, to accomplish. Isn't it a fact that some have the mistaken notion that they are exercising the office of friendship by excessive expressions of sympathy, encouraging or exaggerating the thoughts of illness, when, instead of offering such words and deeds that would help strengthen and cheer, they produce a disheartening, depressing and enervating influence?

The thrill of encouragement that has come from a friendly source has been the turning point in many a life. How many of us would have given up in the struggle for success but for the helpful influence of those who have the utmost confidence in us?

Adversity can be said to be an infallible test of true friendship. Superficial friendship, the result of a possession of an abundance of this world's goods, of good fellowship, is not what we should desire. When misfortunes overtake us, there is that power, that encouragement in the tender sympathy of a friend that the darkness of despair and desolation will give way readily to sunshine of hope and cheer. While great friendship is often resultant upon admiration, yet generosity, cordiality and unselfishness are qualities which attract friendship of others, and true friendship is based upon this.

A real, true friend has that faculty of awakening in one, the realization of his power of accomplishment. Frankness, sincerity and justness, and not pretense and deception, are the basis of true friendship.

HOW TO DISTINGUISH LINEN FROM COTTON

Linen is hard to distinguish from cotton especially when the cotton is mercerized or the material heavily starched and well finished.

If the threads are carefully examined it will be found that the cotton thread is the more exact in twist, becomes fuzzy when rubbed between the fingers and when quickly broken the tufted ends usually curl up.

The linen fibres are long and when spun into thread are strong, smooth and lustrous. These threads are rather irregular in appearance and break with the straight uneven ends.

When burned, the ends of cotton thread spread out like a paint brush, while linen threads are even and compact.

A drop of glycerine on linen causes it to become more transparent but does not affect cotton in the same way.

When torn the linen gives shrill noise, the cotton has a duller sound.

There are several chemical tests for distinguishing between linen and cotton but these are not practical for the average house wife, and are not always sure. The microscopic test is the only one which is absolutely certain in all cases.

Real Daylight Saving

In the harvest time every hour between daylight and dark is worth money to the busy farmer.

You get an early start in the morning intending to do a big day's work, but the binder, mower or other implement breaks down and you must go to town for the repairs. If you have a Ford you are soon away and its speed clips two hours off the former three-hour journey there and back.

Count up the extra half days that a Ford will save you

during the rush of seeding, haying and harvest. You will find that the Ford will save you a week or more of valuable time on your necessary trips alone.

Many times you will want to take some produce along with you. Then your staunch Ford is ready to carry a load of 1000 pounds. How handy this would be?

Once you own a Ford and find out the many ways you can use it for business and pleasure you will wonder how you managed without it.

The Ford is an economical investment, and a necessity on every farm.

CONSTIPATION

THE COMMONEST ILL.

Constipation is one of the commonest ills of mankind and one too often allowed to go unlooked after until some serious complication sets in.

If the bowels are properly looked after there will be no constipation, jaundice, sick or bilious headaches, heartburn, coated tongue, sour stomach, floating specks before the eyes, etc.

Milburn's Laxa-Liver Pills will keep the bowels regular and cure all liver ills.

Mr. Philip McLeod, Tarbot, N.S., writes: "I suffered from constipation ever since I can remember, and for years had pains in the left side of the back. If I walked across the kitchen floor I would have to sit down and rest. That I think was terrible for a man of 20 years of age. The condition of my system was shown by pimples breaking out on my face. I suffered so much pain and stiffness in my back I am sure my system was full of poison. Milburn's Laxa-Liver Pills have entirely cured me.

I thoroughly recommend them to everybody."

Milburn's Laxa-Liver Pills are 25c. a vial, 5 vials $1.00, at all dealers or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

500 Acres $5 an Acre For Cattle or Sheep

200 acres machine-worked fields, brook-watered pasture for 500 sheep; wool is high, lambs worth $10 each; woodlot estimated to cut 5000 cords besides timber, variety of fruit; fortune awaits new owner here; good 9-room house, large barn, piggery and poultry house; aged owned forced to sell includes complete outfit of farm tools and machinery; prices for all only $2500 or $5 per acre, part cash, easy terms. For travelling instructions to see this and a splendid farm of 62 acres for only $1200, see page 10, "Our Big Spring Catalogue," filled with bargains everywhere, copy mailed free.—E. A. STROUT FARM AGENCY, Dept. 2612, 294 Washington St., Boston, Mass.

PROVINCIAL EXHIBITION, HALIFAX, SEPT. 12th TO 20th

The Provincial Exhibition at Halifax will be held this year as usual, and the dates fixed are September 12th to 20th.

The Prize List is well under way, and will be ready for mailing about June 1st. No change has been made in the classes, but extra prizes have been added in the Standard Bred, Roadster, Carriage and Clydesdale horse classes, all Pure Bred Cattle classes and in Sheep and Swine classes, which will give the stockman and farmer the largest prize list ever offered in the Maritime Provinces.

This was to have been the year for the Dominion Grant, but on account of war conditions, the Commission did not feel like insisting that the Government give this Grant for this year, but have the promise that Nova Scotia will receive the Grant in 1918 or at the close of the war.

The buildings having been used by the British Remount Commission during the winter for the housing of horses for overseas shipment, will be put in shape at once for the Fall Fair.

Entries close in all departments on September 1st.

The following early closing events in the Speed Classes are:

All $400 Purses.

2 Year Old Trot.
3 Year Old Trot
2.40 Trot (Maritime Bred)
2.40 Pace
2.24 Trot
2.24 Pace
2.19 Trot
2.19 Pace

Entries close June 16th. Horses eligible May 22nd.

HARDY PLUMS

There are great areas in Canada where the European plums, such as Lombard and many others, do not succeed, either the fruit buds or the trees being injured or killed by winter. There are two species of wild plum, however, in Canada, the cultivated varieties of which enable one to grow this fine fruit in very cold regions. In Eastern Canada the common wild species is the Canada plum, **Prunus nigra**, while in Manitoba the common native species is the American plum, **Prunus americana**. It is surprising that trees of these plums are not planted by everyone having a garden when there is room enough to have a few trees, as they bear young and bear abundantly, and the fruit of the best cultivated varieties, while not as good as the best of the European sorts, is excellent when eaten raw and make very good jam when properly cooked.

At the Experimental Farm, Ottawa, over 100 varieties of these plums have been tested during the past twenty-eight years. The outstanding or most widely useful variety of the Canada plum has been found to be the Cheney, a red variety of fairly good quality which cooks well. The Assiniboine, a new variety, is very promising. On account of its earliness, the Cheney is particularly useful in the prairie provinces where many of the varieties are too late to ripen. Few of the American sorts usually offered for sale are sufficiently early for the prairies, most of them having been originated in the states of Minnesota and Iowa, where earliness is not so important. Seedlings of the native Manitoba sorts are now being grown at the Experimental Farms on the prairies to obtain other and better ones. The Major Plum, which has been brought to notice by the Brandon Farm, is a very early sort.

At Ottawa, where the season is long enough for most of the American varieties, the Brackett, Terry and Admiral Schley have proved to be three of the best. Other sorts more generally known are De Soto, Wolk, and Hawkeye. The wood of the American plums being brittle does not stand the heavy snow in Eastern Canada very well, the result being that the trees are often badly broken unless they are headed back each year to make them stocky. The Canada plum, however, makes a very strong tree, hence the Cheney is additionally valuable on this account. The earliests varieties of the Canada and American plums are ready for market before the European ones, hence it has been found at Ottawa that the prices obtained for them are nearly always quite remunerative, and the profits probably greater than from plums in the best plum districts.

Another hardy plum is the Omaha which experiments at Ottawa have shown to be one of the best for that part of Canada, and, it is believed, for districts having a somewhat similar climate. This is a hybrid between the Japanese plum and the American, and has combined in it the good points of both, being, like the American, hardier than the Japanese, but having the thin skin asd firm flesh of the latter. The Omaha ripens about the middle of August, a time when there is usually a good market for plums.

It is desirable to have more than one variety of these hardy plums if the best success is to be obtained as they are more or less self-sterile and each variety requires another near it blooming at the same time to ensure a good crop for both.

Wild plums in some parts of Canada do not usually develop well owing to

This is the Economical Paint to Use

CERTAIN inherent qualities are essential in paint to ensure your permanent satisfaction with its application.

Of these, the more important are Endurance and Covering Capacity. The extent to which these qualities are present, accurately determines the real value of your paint.

B-H "ENGLISH" PAINT 70% Pure White Lead / 30% Pure White Zinc / 100% Pure Paint

made in over fifty artistic shades, combines these virtues in such a manner as to produce a result no other paint can excel, and few can equal.

It is economical because it will cover more surface and wear longer than other paints. A cheap paint does not permit of the use of the best ingredients, and always is expensive in the long run.

B-H "English" Paint—costing but little more than a cheap mixture—produces a better job that lasts three to four times as long.

Other B-H. Products

FRESCO-TONE—For wall and ceiling decoration.
CHINA-LAC—For staining furniture, woodwork, bric-a-brac, etc.
B-H. FLOOR LUSTRE—An enamel floor paint.
B-H. ENGLISH ENAMEL—A high quality product for interior decoration.
ANCHOR SHINGLE STAIN—A durable stain that will not fade. Comes in twelve colours.

This China-Lac Booklet sent to you FREE

It tells in an interesting manner the many uses to which you can put "China-Lac" Varnish stain. Explains how to use this wonderful home beautifier for best results. Shows conclusively that a small investment in a tin of China-Lac and a varnish brush will repay you many times over in the like-new effect it gives to furniture, floors, woodwork. Also made in gold and aluminum for radiators.

For Sale at all the better Hardware and General Stores throughout Canada

Everjet Elastic Paint

An Ideal Farm Paint

Around the farm or home, wherever you have surfaces exposed to wind, wear and weather, you can save money and the trouble of renewing things, by using Everjet Elastic Paint.

Carbon paints are the most durable of all and Everjet is the best carbon paint ever made. It is the ideal roof paint. Stops deterioration and leaks; adds a good many years to the life of a roof.

Wonderful on metal surfaces because it is elastic and will not peel or crack under temperature changes. It will keep your implements fit. Try some. You will never be without it.

Butter Parchment at Farmer Office

disease, but it has been found at the Experimental Farm at Ottawa that thorough spraying every year will usually ensure good fruit.

THE BROOD MARE AND HER FOAL

(Continued from page 471)

day's work into three short periods, instead of the usual forenoon and afternoon periods. It is positively bad for the young foal to let it be without its mother for a whole half day when it is only three or four days old.

There is always the temptation, under certain conditions, to put the mare into the collar too soon after foaling, but in the long run it does not pay. The holiday of two weeks, or the breaking up of the working day into shorter periods, will enable her to stand the work well and at the same time take good care of the foal.

The colt should be allowed to run with the dam until it is about six months old, and mare fed so that the colt will get plenty of nourishment during that period. The colt should finish off its mother in a full fleshed and fat condition and the training it should get in feeding will keep it from the set back that comes to many colts that are suddenly weaned, and thrown off on their own in the fall.—O. V. J.

SODIUM FLUORIDE KILLS LICE

By a newly tried remedy a poultry flock can be rid of all seven common species of chicken lice in a few days by one application of sodium fluoride. One pound of this white powder as dust, costing 40 or 50 cents through the local drug store, is enough to treat 100 fowls. If dissolved in water and used as a dip, the same amount will go three times as far. The finely powdered commercial form is cheaper and more easily applied by the dusting method than the fine crystallized sodium fluoride.

Holding the fowl by the legs or wings, one pinch of sodium fluoride is applied each to the head, neck, back, breast, below the vent, tail, either thigh and underside of each wing. Sodium fluoride is irritating to the nose and throat and will cause local irritation to the skin. The applicant must guard against it. As a dip, the sodium fluoride is harmless and more easily solved at the rate of three-fourths to one ounce of commercial powder or two-thirds ounce of the chemically pure material to each gallon of water.

TO PROLONG THE LIFE OF FENCE POSTS

,Ct 5w-s ,mmt 0leo a|,,w?e s v, -hrs

Will you please explain to me either through your valuable paper or in a letter the best way to treat fence posts to keep them from decaying. Is creosote a good oil to use, if so should the posts be boiled or how should they be treated?—A. B. in Western Ex

Answer:—The chief requirement of a fence post is durability. The most durable woods which we have in the West here to use for fence posts are cedar and oak.

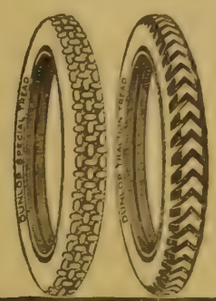
Fence posts of these varieties of wood are expensive, and we have got to fall back on the trees which are more common on the prairie, that is maple, willow, elm, cottonwood, poplar, etc. The wood of these last-named varieties are not at all durable and the life of a fence post made of the last named varieties is very limited and does not exceed three to five years at the most. Fortunately such woods can be made durable at a small expense by preservative treatment, and can be made to last at least three times their ordinary lifetime. The decay in the wood is caused by low forms of animal life called Fungi, which cause the destruction of the tissues of the wood. These plant

DUNLOP TIRES
"Special Tread" - "Traction Tread"

Service Begets Supremacy

Dunlop---"The Automobile Tire you see the most of and hear the most about."

Most Mileage



Most Safety

A. 75

forms live inside the wood, breaking down the fibres and producing what we call decay. Like other forms of plant life, fungi require for their growth and development, moisture, air, heat and food. A fence post decays most quickly at the ground, because there the conditions of air and moisture are most favorable to the growth of the fungi. The decay is much slower in the top of the post because the wood dries quickly out after it has become wet, and very slowly indeed below the surface of the ground, because of the lack of air. If the fungus is deprived of any of these factors of growth it cannot live. Wood that is kept thoroughly dry cannot decay. Wood immersed in water cannot decay because of lack of air. Bog oak is dug up from the swamps of Ireland where it has lain for centuries and made into furniture. Wood decays very slowly in the cold northern regions. Wood that has been poisoned so that fungus is deprived of its food supply will never decay as long as the poison remains in the wood. Any method by which wood can be kept dry, or that will tend to prevent the entrance of the fungus plant, will prolong the life of fence posts. Piling stones, ashes or gravel about the base, or setting the posts in cement, or concrete, will help to drain away the moisture, and prevent the growth of weeds which keep the air from circulating freely around the post. Thoroughly seasoned posts will last much longer than those which are put in green. Good results have been obtained by charring the end of posts over an open fire. The posts must be thoroughly seasoned to prevent splitting or checking, and the charring must extend at least six inches above the surface of the ground where the post is set. Painting the surface of the post, or coating it with some preservative substance, like tar, petroleum, or creosote will help to keep out the moisture, and also prevent the entrance of fungi, although if the posts are green the sap rots the posts underneath the coating of preservative. When posts are painted, or creosoted with a brush care must be taken to see that any cracks or crevices in the post are filled with the solution.

Another plan is to take an old boiler and fill it with creosote and set the boiler over an open fire and taking thoroughly dry posts, put the ends of them into the liquid up to about 40 inches, which will ensure all being treated which will be underground. For soft wood like we have in this country, it is advisable to invert the post so that the whole surface will be treated. The creosote has to be heated up to about 220 degrees F. and after the posts have been in the liquid a couple of hours, the fire is withdrawn and the posts allowed to cool. About twenty posts can be put into a good sized boiler and two runs treated in a day making 40 in all. This can be done without interfering with the ordinary work of the farm.

Before beginning the creosoting operations the posts should have been piled up to thoroughly season for about five or six weeks, the bark and especially the inner skin of bark should all be peeled off and the posts put into the tank so that the process will affect the wood for a few inches above where it is put into the earth, as it is at the surface of the earth that decay usually takes place. Round posts are preferable to split posts, as heartwood, except in the case of cottonwood does not absorb creosote readily. The advantage of a preservative treatment lies in the fact that material for posts can be had from the wood lot or they can be purchased at a low price and even with the extra cost of creosoting will not amount to much more than the original cost of cedar posts. Besides, a well creosoted post will last for 20 years.

If one wishes to be sure she is buying linen, it is well to remember that one seldom gets linen when paying cotton prices.

More Money for the Farmer

WHEN live stock is tormented by vermin, lice, mites or flies, it cannot be profitable. You can prevent this annoyance and have more profitable stock by using Creonoid. Think this over. It means money for you.

CREONOID

Lice Destroyer and Cow Spray

Creonoid stands alone as a lice killer and cattle spray. Economical too, because it is so strong that a little goes very far. Give your horses and cattle a fine, long distance spraying, so that they get the vapor. It will make them clean and vermin free. Put some Creonoid in the hennery and piggery. The use of Creonoid means better stock, more eggs, more good porkers, more milk. Try some now.

CHOPPED ALFALFA VS. BRAN FOR DAIRY COWS

(Continued from page 467)

of fifteen days the cows in Lot A were fed the alfalfa mixture, and the cows in Lot B the bran mixture for fifteen days. Then the cows in Lot A were given the bran mixture and the cows in Lot B the alfalfa mixture for fifteen days. For another fifteen days the cows in Lot A were given the alfalfa mixture and those in Lot B the bran mixture. During two of the four fifteen-day periods each lot of cows was fed a grain mixture of 4 parts of corn, 2 parts of bran and 1 part of oilmeal, and during the other two periods each lot was fed a grain mixture of 4 parts of corn, 2 parts of chopped alfalfa, and 1 part of oilmeal. At all times there were six cows on one ration and six on the other.

The amount of grain fed to a cow was based on her milk production, but the two cows in each pair were fed the same amount of grain. The cows were fed 30 pounds of silage each, daily, and all the alfalfa hay they cared for, which is estimated at 20 pounds per head daily. During the third period one cow in Lot A, being fed the bran mixture, went off feed for a few days, and during the fourth period another cow in Lot A, being fed the alfalfa mixture, dropped in production for a few days. As one cow was off when on bran and the other when on alfalfa, these deficiencies do not influence the final results.

The six cows in Lot A while on the bran mixture during two fifteen-day periods gave 3,972 pounds of milk containing 143.3 pounds of butterfat, and lost 32 pounds in weight. The same six cows while on the alfalfa mixture during two fifteen-day periods gave 4,052 pounds of milk containing 138.7 pounds of butterfat, and gained 223 pounds in weight. The six cows of Lot B while on the bran mixture during two fifteen-day periods gave 4,244 pounds of milk containing 158.4 pounds of butterfat and gained 254 pounds in weight. This same group of cows while on the alfalfa mixture during two fifteen-day periods gave 4,332 pounds of milk containing 163.6 pounds of butterfat, and gained 1 pound in weight. Bringing together the results from both groups we find that the twelve cows while eating the bran mixture during two fifteen-day periods produced 8,216.5 pounds of milk containing 302.7 pounds of butterfat, and gained 222 pounds in weight. The same twelve cows while on the alfalfa mixture during similar periods produced 8,384.5 pounds of milk containing 302.3 pounds of butterfat, and gained 224 pounds in weight.

During this test with twelve cows for a period of two months chopped alfalfa was substituted for bran in the standard dairy ration of 4 parts of ground corn, 2 parts of bran and 1 part of oilmeal, with no appreciable effects, either favorable or unfavorable. If these results are the same as will be found in general practice, then alfalfa fed in this manner has the same feeding value as bran. Since the same amount of butterfat and practically the same amount of milk was produced from the ration containing chopped alfalfa as from the ration containing bran, the difference in the cost of production is only the difference in the cost of the alfalfa and the bran. Valuing a good quality of chopped alfalfa at $12 per ton and bran at $30, the saving in cost of feed, due to substituting chopped alfalfa for bran, amounted to 13.6 cents per 100 pounds of milk, or 11 percent of the cost of the feed eaten by the cows in producing this milk. The test was suggested and the details performed by our efficient herdsman A. R. Sharrah.

Extremely Severe

Dyspepsia

Halifax (N.S.) Sergeant in the C.E.F. Cured Completely by Dr. Cassell's Tablets.

SERGEANT DUNCAN MacNEIL, of the CANADIAN EXPEDITIONARY FORCE, writing from Europe (his home address is 116, PLEASANT STREET, HALIFAX, N.S.) says:—

"For six years I suffered from frequent attacks of Dyspepsia, each attack being more acute than the last. During one of these attacks life would become almost unbearable, and I would have to regulate my diet to liquid foods only, often being in bed for days at a time. I was under the care of a Physician, and tried all the remedies on the market, spending a small fortune, but obtained little or no relief. I became utterly discouraged, and had almost given up all hope of Cure.

Sgt. MacNeil.

"When the war broke out I joined the Expeditionary Force and came to England. I had not been long there, however, when my old trouble returned, and I had to go to hospital. While in hospital a friend told me of Dr. Cassell's Tablets, and I decided to try them. The first box brought such pronounced relief that I continued the treatment. To make a long story short, a complete cure was effected.

"Since taking Dr. Cassell's Tablets I have been through hardships almost beyond human endurance, but not once has my old trouble returned to bother me."

The above is the frank, clear testimony of a Canadian soldier. He has been cured of extremely severe dyspepsia, which even the healthful life of the training ground could not overcome, and he wishes to tell others that he owes that cure to Dr. Cassell's Tablets.

HISTORY OF THE POTATO

In telling the story of the vegetables which we eat so regularly, we seldom question whence they came or how they were introduced. The potato is the first to be considered. It is the one vegetable seen everywhere, the universal accompaniment to meat, and often its substitute.

It is so well known that it may seem foolish to consider what it is, yet if the general knowledge were questioned, it might prove rather vague. Some people might pronounce the potato a root. In ordinary speech, it is mentioned among root crops—but in reality it is not any more than the asparagus is. The one is a stem with undeveloped leaves, forcing itself through the ground; the other is a stem, growing under ground. It is not commonly recognized as a stem, on account of its thickened or tuberous form. If a potato plant be pulled up, the true roots can easily be distinguished from the under-ground stem with the tips swelling into young potatoes.

Scientists tell us that we are not very largely gainers for the appropriation of the potato, for while it furnishes an acceptable food, it does not supply a large amount of nutrition. The potato, therefore, does not stand at the head of the list of vegetables in value, although it does in popularity. The potato comes of a very bad family, indeed—many of whose members are real reprobates.

It has a few relatives of good character, such as the tomato, the artichoke, the winter cherry and the egg plant, yet the whole Solanum family is regarded with suspicion.

In 1886, the ter-centenary of the potato was celebrated in England, with very interesting exercises. Credit is generally given to Sir Walter Raleigh for bringing it to England. In July, 1586, he brought the potato from Virginia, having got them from the colonists whom he had placed there in 1584. For the next century and a half, they were planted in gardens only. The potato was one of the gifts from the New World to the Old. It is a native of Chili and Peru, where the Spaniards found it under cultivation. They introduced it into Spain, from whence it was taken to Italy and then to Belgium, some years before it was known in England.

The story of its introduction into France is too interesting to be omitted. "In 1769, there was a terrible famine in that country. The grain crop was ruined, and the poor were reduced to the verge of starvation. The sight of men disputing with the beasts for the scanty harvest of the fields, and even eating grass, moved a benevolent chemist, named Dr. Parmentier, to search for some means of help. He recalled that during his imprisonment in Prussia as a military captain, the government had issued rations of a vegetable generally supposed to be fit only to be fed to cattle.

"The doctor had found the food not unpalatable, and had made entry in his notebook regarding the possibility of its use for human food in time of scarcity. Such a time had come, and the chemist prepared a pamphlet on 'Certain Vegetables That in Time of Necessity Can be Substituted for Ordinary Food.' The treatise found favor with the minister of agriculture, and there was granted by order of Louis XVI a tract of waste land near Paris to the 'tubercle man,' for the cultivation of his new plant.

"Nothing but scornful amusement greeted him at first, but the doctor understood human nature. When, on Aug. 21, the king's fete day arrived, 'the tubercle man' wended his way to Versailles with a basket of the tubers in one hand and a boquet of the flowers in the other. He presented the flowers to the king, who pronounced them superb, and placed one in his buttonhole, giving the rest to the queen, who twined them in her hair. The tubers were boiled for the royal table, and Louis XVI ate his first potato.

"The potato blossom became at once the vogue, and courtiers view with each other in their efforts to obtain some of the rare flowers; $45 was the price paid by one of them for a cluster.

"Dr. Parmentier saw, however, that he was not reaching the end he had in view, that of introducing a new vegetable to the poor. He therefore had a guard set around the potato patch, and various reports circulated to arouse curiosity. Certain of the guard had secret orders to stray away from their posts during the night, and the doctor's stratagem was rewarded by the disappearance of quantities of his new vegetable. By degrees the prejudice against it was overcome, and Dr. Parmentier attained his benevolent purpose of supplying the poor with a food that could be obtained cheaply and abundantly."

In Scotland they were not cultivated as a field crop until 1732, and they have gradually made way to the position they now occupy.

The Irish potato is grown to some extent in every state in the Union, but it plays an important part in farming in the northern states only. The leading potato-growing states of the country—those where the potato is at home, and where it forms an important crop—are the two northern tiers of states east of the 100th meridian. Besides this, there are several states growing large quantities of potatoes but not comparable with the district mentioned. There are 10 leading potato-growing states. New York ranks first, Maine second. The average yield in Maine is considerably more than for any of the other states which are nearly twice as large.

Aroostook county is the largest potato-growing county in the United States, its average yield being 275 bushels (100 barrels) per acre.—Maine Farmer.

FAT IS NOT MUSCLE

An 1,800-pound horse undoubtedly can do more work than one weighing 1,400 pounds, but if the big one comes down to 1,600 the little one will likely beat him. If both fall off an equal number of pounds from their best working weight the one least affected would be relatively best after the reduction. If 200 pounds above his working weight are added to the 1,400-pound horse that will not bring him in efficiency within 200 pounds of the 1,800-pound horse; it will rather decrease his efficiency to the point where it cuts his wind and softens his muscles. The same thing will occur with the 1,800-pound horse if he weighs a ton in soft, spring condition. A horse, no more than a man, can do his best if he is much over or under weight. One over-fat or under-fed horse in a team will weaken the team, unless the poor brute is put through regardless of his condition. If the team is worked anywhere near to capacity, any but a very hard horse will be injured. If he is held down to the capacity of the weak horse, it means loss.

As a rule in spring the team will be too fat. One must not expect such horses to do the work of conditioned ones, but should resign himself to conditioning them in the field, taking the necessary time. Otherwise they will be more or less injured from neglect to condition them previously. Big horses must be kept up to their optimum working weight. Little horses cannot be made to take the big ones' places with any more success than the frog simulated the ox by filling himself with wind. It takes just so many pounds of muscle to accomplish a task. Fat may look like muscle but it will not work like it. Neither can a big horse that has lost a couple of hundred pounds of muscle from his working equipment deliver the work that a horse of the weight to which he has been reduced can easily do day in and day out because be is in the right condition.—L. Ogilvy.

CATARACT AND BLINDNESS IN HORSE

I have a horse, nearly blind, the ball of the eye being covered with a white opaque substance. I see nitrate of silver recommended for cases like this. How is it applied? I do not know how long the eye has been this way now how it has been caused. W. S.

The symptoms you describe point to cataract, which is the common termination of all inflammatory diseases of the eye. In recent cases, the eye may be cleared up by giving a purgative, consisting of six drachms barbadoes aloes, 1 tablespoonful ginger, 1 tablespoonful of gentian and 1 pound syrup, mixed and given as a drench. Then apply nitrate of silver, 10 grains, to one ounce of water. Apply by squirting the mixture into the eye with a small syringe. But if it is a case of long standing, there is not much chance of it getting better. This disease can only be successfully prevented by applying remedies whenever it is first noticed.

Some Compromise

A little colored girl, a newcomer in Sunday school, gave her name to the teacher at "Fertilizer Johnson." Later the teacher asked the child's mother if that was right.

"Yes, ma'am, dat's her name," said the fond parent. "You see, she was named fer me and her father. Her father's name am Ferdinand and my name is Liza. So we named her Fertilizer."—Boston Transcript.

No longer a dream!

You can take off a bumper hay crop without an hour's delay and with the least work by using a

Frost & Wood Mower & Rake

You want to harvest your hay crop just when its ready. You don't want to be stopped by inferior balky machines. That's why we say let Frost & Wood 80 years of successful, practical experience help you out. It costs nothing exra.

The Frost & Wood Rake

Built on a strong, heavy, angle-steel frame. Parts are rivetted, not bolted so they cannot shake off. Teeth are special high grade spring steel, every one carefully tempered and tested. The hardest work and roughest usage won't pull the F & W Rake out of shape. Fitted with automatic dumping device.

The Frost & Wood Mower

It's a delight to use it. Simple and easily managed yet a marvel of efficiency and strength. Very light draft because of the high grade steel roller bearings we use. Knives will work even with cutter-bar raised to clear obstructions, saving time and crop. Internal drive gear, superior cutter-bar adjustment and construction all show the hand of the master-mechanic and guarantee years of splendid service.

Write today for folder on F & W Mower, and Rakes, Side Delivery Rakes, Hay Loaders, etc. You'll get some profitable pointers on hay making.

Soil Fertility--Its Economic Maintenance and Increase

By Frank T. Shutt, M.A., D.S.C. Dominion Chemist

We are again called upon to take part in an educational campaign, with the view of increasing the output of our agricultural products. It is in this most practical way, the larger production of foodstuffs, that many a Canadian farmer can, in these troublous times, very materially assist the Empire. It is thus that he can "do his bit" and "serve his King and country."

INCREASED PRODUCTION.

In this campaign we are not so anxious to urge upon our farmers an increase in the acreage or area to be put under crop as to obtain a larger yield from the acreage at present under crop. We think that those who are engaged in this campaign should have that point well in view, and we might say with regard to that phase of the question there is plety of scope for improvement in Canada. We realize, speaking generally, that our crop yields are very much below what is possible, probably in many cases below what is profitable: not merely below the maximum, but below a decent average. There is plenty of margin for improvement in that regard, and I think our energies, at the present time, should be more particularly bent in the direction of urging our farmers to bring up the average of the yield rather than to extend the acreage to be put under crop, although there are places where both may be necessary and desirable.

We have been terribly wasteful of plant food, especially in the Northwest, where farming has been likened to mining, and it is by sounding a note of warning for the future that we should endeavour to get our farmers to maintain and increase the fertility of our soils, and by better, more rational methods, to put a stop to that waste. This warning is necessary in Ontario and Eastern Canada. We must not blame the farmers too much for using methods, if such they can be called, that have impoverished their soil. We have now, however, arrived at that stage where we can change from the extensive to intensive farming. And we must change. It is going to be easier, more profitable, for the farmer to get 60 bushels from one acre than it will be for him to get 30 bushels per acre from two acres; of course this is a very rough and ready illustration, but it will convey the idea I wish to bring forward, viz., that on many farms there will be more profit coming to the farmer from the extra increase in his yield than by putting more land under tillage. Consequently in this present campaign we must place a great deal of emphasis upon this matter of increasing the soil's fertility. We must not tell farmers that the yields are absolutely, entirely and exclusively dependent upon the plant food in the soil, or even upon the available plant food in the soil; there are other factors, the moisture in the soil, the temperature and a number of other conditions which go to make the crop a success or failure. Nevertheless, the amount of plant food in the soil which is available is a prime factor in determining the yield. That is the question to emphasize, we urge our farmers as a fundamental proposition to increase the plant food in the soil by every legitimate, economic means, and we will now discuss some of our teachings in that diretion. Thorough tillage, the growing of legumes, more manure and its care and proper application; these are the means at our command.

FARMYARD MANURES.

All our work has emphasized the value of farmyard manures as the most effective fertilizer that we can apply. The explanation, we think, is readily found. We make this statement that manure has a greater productive value than can be attributed to it from the plant food that it contains, than is indicated by its percentages of nitrogen, phosphoric acid and potash. Commercial fertilizers are bought, or ought to be bought, on the basis of potash, nitrogen and phosphoric acid that they contain. If we know the percentages of these in the fertilizer, and their availability, and we know the market price of these materials, we can calculate the exact value of the particular brand and say it is worth $25 or $35 a ton. We may take a sample of the manure and analyze it. We ascertain the percentages that are present of these various plant foods, and from them we calculate that at the present time such a sample of barnyard manure should be worth, say, $2.50 a ton. Then this manure has a greater value than can be attributed to it from the amount of its plant food content, that is, over and above $2.50 per ton.

MANURE A SOURCE OF HUMUS.

The explanation is that manure furnishes humus-forming material. It is not necessary, perhaps, to go into any lengthy definition of humus. Humus, for our purposes, is simply semi-decomposed organic matter, and it is probably the most valuable of all our soil constituents.

HUMUS A SOURCE OF NITROGEN.

We find that all our virgin soils of extraordinary richness and fertility are well supplied with this vegetable matter, this humus-forming material, and soils exhausted by cropping and irrational system of farming have had this material dissipated, destroyed. Moreover, humus is important because it is the storehouse of nitrogen. Nitrogen is an important element of plant food, not merely because it is essential to the life of the plant, but because it is a very expensive form of plant life when we have to buy it for fertilizing purposes, something like three times the price of phosphoric acid and potash, weight for weight. When the humus is burned out of the soil by irrational methods of farming the nitrogen goes with it, for this humus is nature's guardian for this important element. We have, therefore, to consider the humus content of the soil as indicating in a very large measure its relative fertility.

PHYSICAL EFFECTS OF HUMUS.

Further, humus has a very remarkable influence upon the mechanical texture of the soil. As we said a moment ago, the fertility of the soil does not depend altogether on the amount and availability of the plant food present; productiveness depends in large measure upon the physical or mechanical condition of a soil. It must offer a very comfortable convenient and suitable, medium for the germination of the seed and for the growth of the young and tender rootlet and the extension of the root system. It must also be well aerated and it must hold moisture. Well, in a word this humus material in the soil has all these functions, the bringing of the soil into a right condition of tilth; humus or semi-decayed organic matter makes a soil a comfortable medium for the growth of crops. We have to house our families and our live stock. It is the same with our crops. It is not merely the plant food that is essential, but we must have the soil comfortable for them to live in or they will not thrive.

BIOLOGICAL EFFECTS OF HUMUS.

Then there is another matter: humus supports the microscopic life of the soil. We understand now from recent researches that the soil is crowded with micro-organisms, bacteria, and these perform a very useful function. Their prime function is to convert unavailable plant food into available forms for crop use. They feed on this humus-forming material, provided the soil is warm, moist and well aerated. The more vegetable matter (humus) we can give them the more they thrive and develop. It follows that the more available plant food we have in the soil the larger will be our crop yields, speaking roughly, other things being equal. So that it is evident there are many useful functions that this humus material has to perform in the soil. Apart from the purely chemical one of plant food, it has a biological function in supporting the life of the soil, and it has the physical function in improving the tilth. These are the reasons why we say that manure has a greater value than might be indicated, by its percentages of plant food, and that is really the fundamental difference between manure and fertilizer. Manure furnishes a large amount of this humus-forming material; and, more than that, it supplies with it the elements for these soil bacteria to live on and to transform into food useful for farm crops.

MANURE ON MUCK SOILS.

Farm manures are teeming with bacterial life, and it is for this reason chiefly, I believe, that we have found it a succesful practice to apply manure to muck soils. Muck is very largely semi-decayed vegetable matter. It looks like carrying coals to Newcastle to put more organic matter on such soil, but nevertheless we do find that even small amounts of barnyard manure are very useful at the outset in reclaiming these muck soils. Why? Partly because the plant food in the muck is not in an available condition, and there is a certain percentage of plant food in manure in an active, readily soluble and available condition. I believe, further, that the value of manure follows from what we may term an inoculation of the soil, the seeding of that soil with germs, with bacteria, and these cause a further breakdown of the components of the soil that will render the plant food of the muck soil available for crops. Consequently we believe there is a strong line of demarcation to be drawn between manures on the one hand and fertilizers on the other; this knowledge will make plain to our farmers why manure is undoubtedly, and must necessarily be, more effective than fertilizers.

FREQUENCY OF APPLYING MANURE.

The next deduction we made from our work was that there is a value in frequency of application. The reason for that is this: There is a natural destruction or dissipation of the organic matter in the soils from oxidation and chemical reactions following the tilling, the cultivaton of the soil, which results in the loss more or less of this organic matter from the manure. We have found, for instance, that when we first till our rich soils in the Northwest, there is for the first five years or so a very heavy destruction of humus material. As we proceed we reach a minimum, or at least a limit, below which the destruction of the humus becomes slower and slower. There is, however, always a loss; good farming methods seek to constantly replenish the soil with humus and plant food. The point is, the richer we have our soils by the addition of manure the larger will be

(Continued on page 495)

How to Can Fruit and Vegetables

The Editor of the Maritime Farmer can vouch for the excellence of the methods set forth in the following article on "How to Can Fruit and Vegetables." Owing to sickness in the family he was obliged to make an attempt at preserving and canning some strawberries and despite the fact that it was his first attempt, by following the principles set forth in the following article he succeeded beyond his fondest hopes. Every jar, about forty all told, opened in perfect condition and good judges of preserves who had the opportunity shall we say the good luck to partake of them were unanimous in their verdict "the best we ever tasted."

The following articles appeared in the New England Homestead. We are pleased to reproduce them in the columns of The Maritime Farmer and trust that many more of our readers will be as successful as we have been in putting into practice the principles involved and so thoroughly explained.

We housewives used to know of only one way of canning things that we wanted to keep—that is, the open-kettle method—cooking the stuff a certain amount of time, then filling it into jars and sealing it air-tight. This method answered pretty well, but very often it failed in certain cases. Every housewife at some time had the experience of having some of her canned goods spoil. Generally she could not account for this. She thought that probably air had got into the jars because of imperfect sealing. That, however, was not necessarily the case. The fact is that some live bacteria might have got into the can while she was transferring the boiling stuff from the kettle to the can—and any amount of care could not prevent that.

Canning by the so-called cold-pack method is not only easier, but is safer and more satisfactory in every way. It is not such hot and unpleasant work Bacteria cannot get into the cans. There is no need to use a lot of sugar or any preserving agents of any kind, and the color and flavor of the product are retained.

The cold-pack method is very simple The utensils required are something in the way of a vessel large and deep enough to hold a certain number of cans or jars so that these can be covered with water and the vessel closely covered to keep in the steam. A wooden rack should be placed in the bottom of this vessel so that the glass jars will not touch the bottom. Then another large kettle is needed for boiling water to "blanch" the product before canning, and another vessel to hold cold water to dip the product right after blanching. Aside from these utensils, only the ordinary tools are required, such as sharp knives, spoons, holders, etc.

The cold-pack method consists simply of this: First, cleaning and preparing the product in the usual way, dipping in the boiling water for a stipulated number of minutes (blanching), then emersing in a cold bath, then packing into jars, adding hot syrup or water, partially sealing, putting in the sterilizing vessel with hot water, and boiling for a stipulated time, then sealing the jars perfectly. That is all there is to it.

Any bacteria that got into the jar while it was being filled was killed while the contents were being sterilized during the cooking in the boiling water bath. We used to be very careful to have our jars full to overflowing before we put on the top, trying to make sure that there would be no air in the cans. This was simply because the air was always more or less full of bacteria of some kind. By the cold-pack method we need not worry about this. If the can were only half full, the contents would keep perfectly, provided sterilization had been completed.

Simple and Easy Work

Now, as to the exact procedure, when canning by the cold-pack method: The time table shown on this page will tell you the required time for blanching and sterilizing. Have all your paraphernalia ready and at hand. After cleaning and preparing the fruit or vegetable in the usual way, put it into a cheesecloth bag (and this bag should be long enough so that the top can be twisted and protrude out of the kettle), and emerse in a kettle of boiling water. Cover the kettle and scald for the exact time called for by the time table. This is called "blanching." Then lift out and dip the bag in cold water. Do not leave the bag in the boiling water any longer than the time called for.

This "blanching" process eliminates objectionable acids and acid flavors, and sets the colors. It is not always necessary to treat all the fruits in this way, except in some cases for ease in peeling, such as peaches for instance. But remember this, that any fruits or vegetables which are blanched, or in other words, scalded in this boiling water bath, must be immediately plunged into cold water. Of course, such vegetables or fruits as are blanched or scalded are by that process cooked a trifle, but most of the fruits are packed fresh without heating, and in no case is the process of cooking complete before the products are put into the jar.

If vegetables do not have enough juice of their own, add boiling water after filling into the jar. It is not necessary to add heavy syrup to the fruits, a light syrup most pleasing to the taste is the best, as too much sweetening disguises the flavor of the fruit.

Have your jars clean and warm, fill with the blanched vegetable or prepared fruit, add hot water or hot syrup, as the case may be; put on a good, new rubber (never use old, hard rubbers), screw down the top slightly, or whatever the method of sealing is. Do not seal completely, as during sterilization steam accumulates in the can and must find some outlet, or the can would be apt to break. For this reason it is best not to fill the can full to overflowing, as we have been in the habit of doing when canning by the open-kettle method. It will do no harm to leave about half an inch of space on top.

Now put in the wooden rack, made of strips of wooden lath criss-cross, to fit in the boiler, or whatever other vessel you are going to use for sterilization; place your filled jars in this and pour into the vessel water of about the same temperature as the jars (to avoid cracking the glass), to within about one inch or so of the tops of the jars. Cover the vessel and note when the water bath begins to boil, and figure your time of cooking from the time when the water begins to boil. You will notice by the time table that different products require different time for cooking—some things needing longer time to sterilize than others. When the sterilizing process is completed, the jars are lifted out of their bath, screwed down or sealed as tightly as possible, and put away somewhere where no draft will get at them, as a cold draft might crack the hot glasses. It is always best to store in a dark, dry place. Light fades the color of the contents.

This is really all there is to the matter of canning by the new cold-pack method. You may can one jar, or a dozen jars at a time, but for the busy housewife, who has the regular routine to manage every day, it is best not to attempt too much at once. A few jars canned every day will make a goodly showing at the end of the season, and she can accomplish this with a minimum of time and labor.

One caution is necessary: Never under any circumstances, after removing the jars from the sterilizing bath, open them to add more syrup or hot water, for that would give bacteria a chance to get in, and all your sterilizing work would be in vain. Remember, the cans do not have to be full, as was necessary with the old-fashioned method, and that the air that was in the cans was sterilized, and so harmless. When the product is put into the jar and the jar closed, and the contents then sterilized, the bacteria which may have been present are killed, and by sealing the jar you prevent any other unsterilized bacteria from getting in.

This cold-pack method really takes the drudgery out of canning, for while the products are sterilizing, you can go about some other business, instead of hanging over a steaming open kettle and stirring and dipping and fussing with full cans, etc. The work that it is necessary to do can all be done when the worker is fresh, not after she is all heated up and tired and nervous. It is just necessary to remember and be accurate about sterilizing the proper length of time. If it is underdone it will not be completely sterilized. If it is overdone, the flavor or texture of the product is more or less unfavorably affected. By the cold-pack method anyone can can food product of any kind. The canning is less work. The work is pleasanter, and it is the only sure way.

Of course, you must not expect anything better to come out of the can than you put into it. In other words, you want to grade your stuff carefully and put in only the best. Remember to have your scalding or blanching bath boiling vigorously, and your cold dip bath really cold. Have all your cans, rubbers and tops read and clean. It is not necessary to sterilize them, as they will be sterilized while the contents are being sterilized. However, the glass cans should be warm when you put the product in them, to avoid danger of breakage, and for the same reason the sterilizing bath should be of about the same temperature as the cans, when you first put the water in. Have it all hot, but not too hot to make it difficult and uncomfortable to handle.

Use good rubbers and see that they lie flat and fit closely up to the jars, then put the covers in place, but do not seal tight. If using screw-top jars, screw the cover down until it catches, then turn about a quarter round back. Or you can screw down the top with thumb and little finger, not using force, but stopping when the cover catches. If you use vacuum-sealed jars, put the cover on and the spring in place. The spring is supposed to give enough to allow the steam to escape. If using glass-top jars with a patent wire snap, put the cover in place, the wire over the top, but leave the clamp up. The reason for all this is that the cover on the glass jar must not be too tight while processing, or sterilizing, because the air and liquid in the jar will expand when heated, and if the cover is not loose enough to allow the steam to escape, the pressure may blow the rubber out, or even break the jar.

After the products are packed in jars it is an advantage to sterilize as quickly as possible, for time lost in bringing the contents to the point of sterilizing softens the products and results in inferior goods. Therefore, it is best to pack in hot jars filled with hot syrup or water, have the sterilizing bath hot when the jars are set in, and bring to a boil quickly. If you will use just ordinary common sense in handling the jars, you ought to have no breakage. Remember, do not begin to count time until the water is boiling. You should be able to secure a hot fire quickly, and keep a fairly even heat.

Do not try to economize on water. You should have plenty of clean water to wash cans and products, to make syrup and brine, and for use in blanching, cold dipping and sterilizing.

As to sterilizing vessels, you can use almost anything you please, so long as it will accomplish the work. You can use a clean wash boiler with a cover, Such a pail is usually heavy enough to hold the heat well, and the cover fits well down over the sides. Lard or coffee cans of a good size can also be used, but being of tin, these do not hold the heat as well as the heavier types. In fact, any large kettle with a cover, that will hold the cans with a wooden rack under them, and that can be properly covered, will serve the purpose.

If you want to do the work outside, it is possible to use a big galvanized wash tub. A board cover can be made to retain the heat. Over a pit dug in the ground, bricked or not, as you choose, put in a smoke pipe, and three or four bricks on which to set the cooker, and keep the fire going briskly

About Commercial Outfits

When it is desired to put up canned goods for sale, glass jars are usually found to be too expensive, unless they can be returned and redeemed. But, of course, this is not always feasible. For this reason, and because they can be better handled, packed and shipped, tin cans are more desirable. Various manufacturers have met this need by offering tin canning outfits in various sizes, for use indoors or outdoors. They range in price from about $7 or $8 to $100, the smallest ones holding about a dozen large cans, or a dozen and a half to two dozen smaller cans. These canning outfits are accompanied

MRS. J. D. McKENNA'S DEATH

We feel confident that the many readers of the Maritime Farmer will join with the office and mechanical staff in heartfelt sympathy for Mr. J. D. McKenna, our business manager, in his great loss, the death of his wife, which took place in St. John suddenly on Saturday last, after a period of lingering illness, borne with christian fortitude.

Mrs. McKenna was a lady of particularly fine and lovable character, always forgetful of self and abounding in good and kindly deeds to others. Every charitable and patriotic movement had in her a staunch supporter, no matter what personal sacrifices were involved. Her home was her castle and her husband and children her first and foremost consideration. She is survived by her husband and four children, Olive, Kathleen, Doris and Louis. Also by her father, Mr. Jas. McGivern of St. John; one sister, Mrs. Capt. Knowlton of Kentville, and one brother, Richard McGivern, Vancouver.

The remains will be laid to rest in Kirk Hill cemetery, Sussex. Services will be conducted in Trinity Church, of which she was a life long member.

by the necessary tools and directions for using, and are very easy to manipulate. It is true that, in this work, as it is with every other work that man or woman is called upon to do in this world—brains count. If you are bright, alert, neat; if you have common sense and mother-wit; if you have ambition; if you have a will that is bound to find a way, you will succeed where others lacking in many of these essentials, will fail. That is Nature's way of rewarding or punishing us.

One thing is sure, that whatever may happen, eating will never go out of fashion, and so if you can provide good food in such shape that it can be easily handled and will keep well, you are sure of a market. But—please do not write in and ask the Household Editor "how" you can sell things you put up. So often people write asking me where they can sell their stories and poems, where they can sell their fancywork, where they can sell their canned goods, how they can get good jobs, and will I please write such and such a "paper" for them to read at some grange meeting or club. I cannot do any of these things for you, and if you will stop and think, the reasons will appear to you clearly. I don't know what you can do, I don't know what your product is worth after you turn it out, I don't know your conditions, or your neighborhood, or your market.

In fact, I am just a housekeeper like yourselves, and I know if I want to sell anything that I produce, I have to hustle around and find my own market. Conditions and places and people vary, and there is one sure thing, that if you want to "start things coming your way," you have to go after them.

If the directions for canning by the cold-pack method are not clear enough to you, or lacking in any essential point, you are at liberty to write to me about it, and if I can answer your questions I will gladly do so.—

Almost every housewife puts up fruits and makes jellies and preserves, but comparatively few of them can any vegetables, with the exception of tomatoes, says Harriet J. Hopkins, of the Massachusetts agricultural college. The general impression seems to prevail that such vegetables as peas, beans and corn cannot be successfully canned in the home. These and other vegetables, however, may be, and they are superior in color and flavor to some of the commercial products, as well as being more economical.

The spoiling of food is due to the presence of micro-organisms which attack it. These micro-organisms get into the food from the air; they live on the food and cause it to spoil. The mold on fruit, meat or bread, the souring of milk, the gas produced in a jar of decaying fruit, the odor of decaying meat or fish, the rotting of fruits and vegetables—all of these are the results of the activity of these micro-organisms. Bacteria, yeasts and molds are everywhere. They are blown about in the air and alight on everything about us. In order that they may grow it is neccessary that they have heat, moisture, food and oxygen. Of these micro-organisms which occur on food materials and cause their decay, each has its own preference in regard to food. Bacteria do not like sugar, nor do many of them care for acid. They prefer foods containing protein, such as milk, eggs, peas, beans, corn, meat, etc. This kind of micro-organism is hard to kill. Yeasts, which are another type of organism, prefer sugar and are not affected by weak acids. They spoil our fruits and fruit juices. Yeast and yeast spores are easily killed. Molds grow on bread, jelly, fruit, etc. and are quite easily killed in the spore state.

What Spoils Food

Since bacteria, yeasts and molds are responsible for the spoiling of our food the problem, then, is to devise some means of preservation by which these plants are either killed or their growth prevented.

Successful canning of food is dependent upon (1) the destruction of all life both on and in the food and the can in which the food is to be placed—

The Herd Bull an Important Factor in Constructive Breeding Plans

By Geo. P. Grout, in Guernsey Breeders Journal

To those who already have a successful working dairy, there may be no need of talking improvements although none of us have begun to reach the limit of possibilities in live stock husbandry. It requires ability in the line of selection to start a herd but it takes constant thought and vigilance to keep it up to the standard. With the best bred stock there is a former inferior type, and unless one has ability to see and select the best, a good herd will not long remain excellent. In my days of less experience, I used to think that extra good stock might likely be found in almost any herd and therefore it was poor policy to buy foundation animals of experts as their price would be prohibitive. I have now learned by experience that a man who does not know and appreciate good stock when he sees it, cannot breed fine stuff. He may breed one or two by chance, but while chance may produce a wonderful freak, it never fixed a good, uniform, useful type.

In the selection of good foundation stock it is well to purchase as good animals as one's pocket book will warrant and from a breeder who knows his business. It is also a good plan to purchase in families. A good animal belonging to an excellent line through both sire and dam is better than an excellent individual of plain family breeding or of breeding that has never given results.

There are good individuals in all breeds and excellent producing families among all scientifically bred dairy cattle. The breed that you like the best that prospers under your local conditions, and flourishes under your care is the breed for you to keep. If you like stock and as a breed they do well for you, it is poor policy to make a change even though some other man has obtained better results with another breed. If you are not reasonably successful you would better look to yourself and see where the trouble lies. You may find some minute detail which alone stands between your herd and success.

When you have made your choice of breeds and have selected a foundation herd, either grade or pure bred, put all your ability and a good amount of cash into the selection of a good sire. The best your pocket book will afford is none too good. So much has been said and written on the subject of good sires that more and more breeders have come to realize the worth of a truly great bull. Since a boy, I have always been an admirer of a great sire. It has been my dream since childhood some day to breed a great animal. In early life my hopes ran high that I might breed a great stallion, but as modern methods of travel largely ignore the horse, I have dropped the idea of horse breeding. I would rather have it said of me that I bred a great sire and had the good judgement to keep him in service than to have it said that I had a string of World's Champions. To me the sire is important and I only wish it possible fully to express my views on the subject.

The sire is more than half the herd for good or bad results, but the great sires in any herd can almost be counted on your fingers. The great dairy sire will breed good cows out of almost any dam. You may or may not have noticed it, but in every breed there are one or two sires that stand out like lone stars in the heavens. Modern dairy methods of record keeping and the popularity of official testing have made it much easier to select a good sire, but all do not take advantage of the information given by the scales and Babcock test. Agricultural papers and Farmers' Institute workers very properly advocate the use of bulls out of tested dams whose records are high.

This method of selection of high production through the bull's dam is in itself an assurance of a high degree of merit and should be the dairy cattle breeder's "chart and compass" clearly to point the way to better live stock husbandry; but to obtain highest results, individuality, long time records and family blood lines should also be given much weight. Hardiness, medium to good size, strong constitution, correct type for the breed, good production in the near relatives and immediate family, together with high quality—these points should be sought in a good sire.

Personally, I believe strongly in the old adage, "Breed not so much to the winner as to the way the winner was bred." If it is possible to breed from record stock and also from family lines of high production, so much the better, but this cannot always be done. To do good constructive breeding requires ability, time, patience and a tenacity of purpose.

With the beginner in live stock improvement, especially in grade herds, the temptation is great to switch breeds or sires every time some enthusiastic breeder demonstrates the superiority of a certain individual within a breed. If you have travelled among farmers in different localities, you know how hard it is to find a flock of chickens in a barnyard that are all the same breed, and uniform in type. For a while barred Plymouth Rocks will be used and when it is found that the neighbors' hens of White Leghorn blood do not bother so much about setting in mid-summer, the farmer makes up his mind gradually to work into the breed and gets one or two pure bred hens and a few roosters. These are used on the Rocks, are kept for the time being but before a complete change has been brought about, it is found that the Leghorn type is wild and gives no return in meat, and as the flock is pretty well mixed it is decided to try a third breed, and so it goes. No matter how poor a farmer may be, if he keeps chickens at all, there is no earthly excuse for not having a uniform flock. Any one who has a mixed lot of chickens for more than one season, has them because he is a scrub breeder, with little tenacity of purpose and because he prefers having scrubs to making a little effort in getting a uniform type.

After the grasshoppers cleaned our family out in southern Minnesota, we were about as poor as the poorest family in Minnesota today and I know from actual experience that poverty does not make it necessary to breed scrubs. The necessity is only in the owner's mind. I know it—for I have been through the mill. We are all changeable, the small farmer and the large breeder as well. Tenacity of purpose is what we lack. The small farmer cannot stick to one breed and the large breeder cannot stick to a single sire until he has made a success with him.

This brings us to the important point in breeding. Make your selection of the breed you wish to develop and do not cross breed. If a breeder cannot cross families within a breed without danger, how can a farmer expect to cross two distinct breeds without absolute disaster? Do not inbreed but keep to one breed and work along family lines. If you wish to develop some character in your herd which you do not have, do not attempt to introduce it by cross breeding. Keep within your breed and select a mating having some of the qualifications desired. If the same foundation blood lines with their proper "nicks" are found in your foundation herd and the outcross introduced, you are quite likely to find that the progeny of this combination will be superior to either of the parent stock.

This is constructive breeding and it may be carried on in building a profitable grade herd as well as with high class pure bred stock. In every successful herd building operation, there are certain "nicks" which blended with a base blood line gives results. There seems to be no other method of determining these affinities than by experiment and through careful selection of producing combinations which carry the base or foundation family lines. By way of illustration take the production of speed in the American trotting horse. It was found that a Wilkes horse crossed on a Mambrino Patchen or Nutwood mare gave speed; other lines nicked as well but this illustration serves our purpose. There are nicks in every line of animal breeding if we are but keen enough to find them. For convenience, if you like, you can call them positive and negative crosses. The results seems to be like a current of electricity when you get the proper combination. I believe one very good reason why world's record stock does not always produce world's champions is because the nicks in the champion's blood lines are so perfectly balanced to obtain these high results that the next cross throws out the affinity and unless we can find an equally well bred and balanced pedigree in the animal mated, and of practically the same blood lines, coming down through not too closely related stock we can not look for as high results in the progeny as we obtain in the immediate ancestors.

My talk is not addressed to expert live stock breeders, but to the farmers who are breeding good producing, commercial herds, and you can use the same principles.

To sum up the whole matter, let us choose our breed and stick to it. If improvement is needed, introduce it from superior animals of the same breed and from closely related families. Do not cross breed except to get a start and then keep building on the same foundation.

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

FARMERS SHOULD DO MORE ADVERTISING

Advertising pays the manufacturer, the wholesale merchant, as well as the retail merchant. It pays the business man, no matter what line of goods he carries. It pays the farmer and poultry raiser just as well as the business man—if properly managed.

If you have good stock that has merit, don't hesitate to let others know about it. There are others who are just as eager to buy as you are to sell, but they will not buy of you unless you let them know what you have to sell.

One of our most successful stock breeders says:

The first question naturally arising is how to do it—how to go ahead. My advice, from a long experience of successful advertising, is to go at it just as you would any other venture; study the question carefully and begin. If you make a mistake profit by it and try again starting with the idea that adverising is an investment and not an expense. When selecting an advertising medium, by all means choose a paper along your lines of business. If you have farm produce, cattle, seeds and the like, advertise in an agricultural paper. As a poultry breeder, I find that a good agricultural paper or local county papers are excellent advertising mediums. It will reach the class of people who are interested in the very thing that you have to sell, otherwise they would not be reading it.

Select a paper that you consider reliable and one that has a good circulation. Let this point interest and influence you more than the rate charged for space. The cost of an advertisement is not measured by what it costs you alone, but by what it brings. Some advertising is cheaper at $4 an inch than some other at $4 a page. No reliable paper charges a good rate for its space without having a reason for so doing. Cheap space may not be cheap in the end. That the best is the cheapest is an true in advertising as in everything else. One good paper will bring better results than several cheap ones.

After having selected your medium and arranged for space, do not make the mistake of trying to crowd too much reading matter into the amount of space. Too many are careless in their preparation of an advertisement; they seem to think all depends on the medium, this is not so. An attractive advertisement is just as far in advance of a poor one, as the decorated show window is ahead of the one filed with last year's goods. Make your advertisement just a little different from others—have a style about it that is all your own.

Having decided where and how o advertise, the next question is when. The best time to advertise is all the time. Spasmodic attempts do not count for much. It is the everlasting keepnig at it that brings results. People think before they buy and some of hem do a great deal of thinking before spending their money. It is a sure thing that they will not think about your stock unless they know about it. By all means keep your name before the public all the time. If you advertise only in the spring, you will not interest the man who prefers to buy in the fall.

Tell some of the merits of your stock this month and tell something different next month, or tell about the same thing in a different way. A business bringing advertisement must interest the people. As you cannot interest all of the people all the time, you must endeavor to interest some of the people all the time. What interests some today may not interest others, but by changing your advertisement, you may interest nex month the very people that you missed last month.

Remember that every inquirer may be a customer. He probably will be if answered promptly and courteously. Give him the attention that you would if you were positive that his first order would be a big one. Keep after him with the intention and determination of selling to him. Do it in a businesslike and convincing manner and if he finds the goods to be as represented his second order is almost invariably sure to follow.

LAST CALL FOR INCREASED PRODUCTION THROUGH PLANTING

The Maritime Farmer would like to sound a last call in the interests of more food production for this season. Many seasons have come and gone since the farmers of the Maritime Provinces have been so retarded in their work of planting and sowing as they are this season. And the late season is not peculiar alone to the Maritime Provinces, other parts of Canada, the United States and Great Britain are also similarly affected. It is not yet too late to prepare soils and use it to advantage in growing crops. Each one must study his own particular situation, the main thing is produce to capacity, while at the same time reducing waste, and the farmer who does both, ranks a close second to his brother who is fighting in the trenches, whereas, he who does neither is a veritable slacker.

Word comes from the United States that the winter wheat crop is badly injured, and no one can fortell what other unfavorable conditions may arise before the 1917 crops are safely garnered

All over this continent, as well as elsewhere, not only farmers, but city and town people are straining as never before, to help tide over the period of almost certain food shortage which we are facing. As already mentioned, each must use his best judgment as to what line his extra production may take. To the livestock man it may mean grow more roughage o produce more beef or milk. To the grain grower, a few extra acres of flax, potatoes, turnips, or some garden truck. The essential thing is to do something more than you intended, to make an extra effort,—and now, even at this late period, think carefully if you cannot add a few more productive acres to what you already have in.

Today the man with loyalty in his heart, and health and youth in his veins is either facing the foe in the trenches of France or elsewhere, or doing his bit, perhaps equally well, by following the furrow from early morn till darkness casts her mantle over the land, in an ever-ceaseless endeavor to supply the real sinews of war. And here men not physically fit through age or otherwise, as well as women find equal opportunity for assisting their country in her hour of need. The slacker is despised and the man who is apathetic regarding production should be equally despised. Both court disaster. What we need is sensible activity which at present spells production. We particularly urge all our somewhat slothful readers, if we have any, to wake up, shake yourselves and wake up your drowsy friends, or neighbors, if you have any. The food crisis is serious, the gravest in the history of the world. Let us be men and face it by doing our part to overcome it.

THE FARMERS' AUTOMOBILE

A Western exchange says there is an increase of 200 per cent. in the machinery being sold to farmers this year over last year. The farmers not only have the desire to farm their land on a larger scale and in a better manner, but they have the money with which to buy the necessary machinery. The cash sales is very much larger than in former years. One farm estimates that no less than 1,200 gasoline tractors have been sold to settlers in Southern Alberta this season. The same conditions prevail in the Maritime Provinces. Not only the regular farm machinery lines are being bought, but automobiles also, which are now acknowledged to be one of the farm necessities, are being extensively purchased by our farmers.

It is said that in the province of Alberta the licenses are now over the 10,000 mark. We believe the farmers who can spare sufficient money to purchase an automobile, is making a good investment. The person who is not in position to pay for the machine, or who must allow other matters to suffer in order to buy, should leave it religiously alone until such a time as he can purchase the auto without inconveniencing himself. The pleasure derived from the use of an automobile and the time one can save in making market and business trips, is a money making and saving proposition.

* * *

Potato scab can be prevented by soaking sets by soaking sets in Formalin, 1 pint in 30 gallons water, soak 2 hours. Change potato ground; avoid fresh manure or lime.

Editorial

SOIL FERTILITY ITS ECONOMIC MAINTENANCE AND INCREASE.

(Continued from page 491)

the inevitable loss due to natural farm operations. There is a limit to which we can enrich our soils, and that limit is determined probably by climatic conditions, and partly probably by soil conditons; there is a limit beyond which it would not pay to put plant food in the soil. We believe, therefore, there is a great economy in frequency of application, for thereby we reduce the natural waste of fertility. On light soils there is a greater waste from those natural process than in heavy soils, heavy soils being more retentive and more conservative than light oils; to putt in concrete form, we believe that 5 tons per acre every third year will give a better return than 10 tons every sixth year, simply because there will be less loss Of course, the question of labour has to be considered in a matter of this kind; but having grasped the principle the farmer will be prepared to plan his work towards carrying it out in some degree at least. We think you may get some idea from this argument as to the reasons for our advice in this matter. It is briefly that camparatively small applications at short intervals are more effective than larger dressings applied less frequently.

POSITION OF MANURE IN THE SOIL

We may now pass on to another point: that is, in regard to the position of manure in the soil. The larger number of the feeding roots of most of our crops lie fairly close to the surface; at least, that is, in humid districts. In arid and semi-arid countries there is a tendency for the roots to go down after moisture, and we may have, as I have seen in certain portions of this country, a dry earth mulch of six or eight inches in which there will be no feeding roots, or practically none. The roots of plants take in their food in the form of a solution, and therefore the roots must go down to water to get their food. Speaking of Eastern Canada, where there is an ample precipitation, usually, and this fairly well distributed throughout the season, we find the larger number of the feeding roots fairly close to the surface, say within the first six inches of soil. If such is the case, we want the food where the feeding roots are, where the moisture is; and consequently, we do not think there is any economy in deeply burying the manure. There will be a larger return from a limited amount of manure lightly turning it under, or by merely carrying it into the prepared surface, as by discing, than by burying it by deep ploughing. Of course, there are soils which need deepening, and that should be done gradually; and there is no doubt that the deeper the surface soil is the better condition the soil is in to conserve moisture. But we have to consider that we have only a limited amount of manure—and unfortunately it is in all too small quantities on the majority of our farms—and we have to make the most of it. Consequently, we think it is a more profitable practice to keep the manure comparatively near the surface.

FRESH VERSUS ROTTED MANURE.

We may now take up the question of fresh versus rotted manure, and we have made very careful and through experiments with regard to that phase of the subject. The result at first sight may seem very surprising, and difficult to explain, because we say that, weight by weight, our fresh manure has given yields almost equal to those obtained from rotted manure. It seems a remarkable result, but nevertheless it must be true, because we have tried it over and over again. We do not mask the fact that rotted manure, weight for weight, contains more plant food than fresh manure. That is, a ton of rotted manure will contain more plant food than a ton of fresh manure, and it is very easy to understand why this is the case; yet, nevertheless, when you make a practical field test you find that the yield from a ton of fresh manure is almost equal to the yield from a ton of rotted manure. Now many explanations could be advanced, but I am not quite sure that I could make those explanations altogether satisfactory to you because I do not know that they are altogether atisfactory to myself. I think there are various reasons for the fact, for fact it is. I think that possibly chemistry, biology and physics all play some part in this matter, but as practical farmers all we need is to realize is that this conclusion regarding fresh manure is correct. We do not seek to make our farmers scientific men; all that we want to do is to induce them to work on scientific principles, and to apply those principles discovered by experiment as far as they may be able. We trust they have confidence in our ability and in our rectitude and will accept this fact.

LOSSES FROM MANURE.

We have done a considerable amount of work of a very careful character with regard to the changes that take place in the rooting of manure; we have traced the losses which inevitably follow, and we have determined these losses under various conditions. We know very well, as everybody else knows who has done any experimental work on this important problem, that it is impossible to rot manure without some loss, even under the very best conditions. Further, we undertake to say this: that on the ordinary Canadian farm, and I believe we are conservative in this, that where the manure is not at once utilized by being put into the soil, or on to the soil, the farmer is losing one-third of the initial value of that manure. We have studied the various methods of rooting manure, and we have come to the conclusion that the losses are least where the manure is kept compact and protected from rain. These are the indispensable conditions. The more manure is opened up and turned the greater will be the bacterial activity and the greater will be the loss—the loss of organic matter largely and the loss of nitrogen; there are very serious losses in these constituents due to excessive fermentation. On the other hand, where the manure is not protected from rain, we have losses from leaching, and those losses are chiefly in potash and nitrogen. Taking it all in all, we doubt very much whether the farmer who does not spread his manure on his fields as far as may be possible when the weather and the condition of soil permit, who does not utilize his manure by getting it into the land or on the land as soon as possible, does not lose from one-third to two-thirds of the plant food originally contained in that manure. If he can get his manure on to his fields while still fresh he may return to his soil seven-tenths of the plant food taken from the soil by the growth of his crops. We have never discovered any method which will prevent loss. The changes begin immediately after voiding, especially in the liquid or urine portion, which is highly nitrogenous, and therefore easily susceptible to composition. It should be impressed upon our farmers that this liquid portion is much more valuable than the solid part, not merely because its plant food is soluble and immediately available. After the urine has been in the stable for a few hours you may notice that the atmosphere smells strongly, and if you were to examine it you would find it contained ammonia, derived from the decomposition of the urine. Just as soon as the urine is voided, if the conditions are favourable, bacterial life becomes active and ammonia is evolved.

It is necessary to quote our work exclusively, but referring to the experiments of others who have worked more extensively than ourselves on this problem, it has been found utterly impossible to save all the plant food which is contained in manure, no matter what system of rotting is followed. The sooner, therefore, that it is got into the soil the better. It will be apparent that when manure is thrown out into the barnyards, and allowed to lie unprotected, the losses must be very large; and I am quite sure that I am well within the limits when I say that under such conditions there is from one-third to two-thirds of its plant food, lost, apart from the loss of its humus-forming material by fermentation. So that brings us to the point that manure has no greater value than at the moment of its production: there is no doubt that its initial value represents its maximum value. Of course, we must be prepared to admit at for certain purposes rotted manure is more desirable than fresh manure; these are special cases. On the other hand, there are soils for which fresh manure is better than rotted manure, as for instance a heavy clay soil. But the point we want to emphasize with the farmers in this campaign is, that the manure in ordinary farming is never of any greater value than it is at the moment of its production.

NATURE AND COMPOSITION OF MANURE.

No farm product is so variable as manure, the composition and value of which depend on a great many factors, Among these are the kind, age, function and food of the animal producing it, the quantity and nature of the litter employed and, last but not least, the care taken in its production and preservation.

The analysis of a large number of samples of fresh horse and cow manure from animals well fed and bedded with sufficient straw to hold all the liquid excreta, gives the following average figures per ton: Nitrogen, 10 pounds; phosphoric acid, 5 pounds; potash, 10 pounds.

The following table states in approximate terms the relative proportions of solid (dung) and liquid (urine) excreta and bedding found in fairly well made manures of the more common farm animals. It also gives the amounts of nitrogen, phosphoric acid and potash in these compounds.

The data express percentages and pounds per ton.

APPROXIMATE AVERAGE COMPOSITION OF MANURE (FRESH) FROM VARIOUS ANIMALS.

Nearly ninety per cent of the total potash excreted by the cow is to be found in the urine, and this, in addition to the fact that one-half or more of the total nitrogen excreted is also present in the liquid excreta. It thus comes about that, weight for weight, urine has a greater manurial value than the solid excrement, and this not only by reason of its larger percentages of potash and nitrogen, but because these constituents are in a soluble condition and practically at once available for the nutrition of crops.

MANURIAL VALUE OF CLOEVR.

Looking to the question of increasing the fertility of the soil, it is important that we understand the manurial value of clover. I do not know of any institution that has done the same amount of work in the laboratory and in the field with the legumes as the Experimental Farms, and all our work has been eminently satisfactory. Farmers must be made aware of the unique property of the legumes in that they are able to appropriate the atmospheric nitrogen. This they are not able to do of themselves but, through the agency of certain bacteria that live in tubercles on their roots. We have been able to show that in this way the legumes may furnish and add to the soil, when turned under, from under, from 50 to 150 pounds of nitrogen per acre. This nitrogen is taken from the atmosphere and it is a most valuable addition to the store of plant food in the soil, vastly increasing its productiveness. Even when the crops of alfalfa are cut and used for fodder still the soils will be richer in nitrogen from growing these crops, because of the nitrogen in the root system which is left in the soil, and the larger the root system the larger the manurial value of the soil. Of all farm crops these leguminous crops alone enrich rather than impoverish the soil. All other crops leave the soil poorer in nitrogen. Some soils are without these nitrogen-fixing bacteria, and in these cases we must adopt the practice of inoculating the soil with cultures of these bacteria, which are necessary to the growth of alfalfa or clover or other leguminous crop. Soil from a field growing clover or alfalfa is an excellent inoculating medium and can be used instead of a culture. We have found, however, that in certain cases that failure in the growth of clover or alfalfa has not been due so much to the absence of the nitrogen-fixing bacteria in the soil as to the unfavourable conditions of the soil; that is to say, for instance, it has been acid instead of alkaline. In such cases the application of lime or ground limestone has given beneficial results. We have been able to show during the past ten or twenty years that we can enrich the soil to a very large extent not only in nitrogen but in humus by the growing of a legume crop systematically in the rotation. If a comparison can be made (the comparison may not be strictly accurate, very few comparisons are), we think that the growth of clover in a rotation is practically equal to a good dressing of manure of say ten tons per acre of ordinary farmyard manure. I do not wish to be considered as laying that down as a definite and absolute fact, but nevertheless by the introduction of a rotation which includes clover or other legumes in districts in which legumes can be grown luxuriously, we find there is invariably a marked increase in the fertility of the soil; and we have repeatedly found an increase in crop yield therefrom equal to that which can be obtained by the use of 5 to 10 tons of barnyard manure per acre.

FERTILIZERS.

There are many inquires in regard to fertilizers, their value and function. In Canada up to the present time our knowledge respecting the value of fertilizers is largely fragmentary—incomplete, if we may so term it. The whole subject is comparatively new in Canada. We have not had the length of time to ascertain what their values may be, in any absolute sense, nor have we had the number of acres on various types of soils, with different crops, under experiment with fertilizers to afford the necessary data to arrive at final conclusions. Consequently our deductions in this matter are to be regarded as tentative and provisional. Years of careful, systematic experimentation are necessary before we can hope to speak with authority on the subject. However, we are preparing for it, and we now have experiments going on with fertilizers in widely distant points in the Dominion. These experiments are being conducted, in so far as we are able to make them, in a scientific and rational way. There have been experiments in Canada in the use of fertilizers which have been irregular and unsatisfactory. From these it is impossible to say in many instances what profit, if any profit, has resulted from their use.

FERTILIZERS AS SUPPLEMENTS TO MANURE.

We have taken the ground that it will never be economically, even if scientifically, possible to maintain soil fertilizers. Our belief is that we can use them only as supplemental to, and not as a substitute for, manure. We have obtained, if you look through our records, in many instances a very fair monetary return from the use of cer-

(Continued on page 510)

THE SECOND SPRAY

Written by G. E. Sanders and W. H. Britten at the request of the United Fruit Companies

Throughout the Valley, growers on the whole, are taking better care of their orchards than they have for hree years. The man who grows No. 3's this year will therefore have a little trouble, to say the least, in finding a market for his fruit.

It seems probable in view of the efficient organization for the marketing of apples here in the Valley that growers may look for their returns in 1917-18 to at least clear expenses and perhaps pay substantial profits. But whatever happens the Annapolis growers are going to have their orchards in excellent condition for crops in 1918 and 1919, while the competitors of Nova Scotia are going to have an immense amount of neglected orchard on their hands when the markets open again, orchard that cannot be brought to full bearing for two or three years at least. Nova Scotian growers on the whole are realizing that their duty and their opportunity will be to supply the markets, to a greater extent than ever before, from Nova Scotian orchards for three or four years at least after conditions become normal again, and so are taking measures to prevent their orchards from deteriorating.

In the control of the biting insects the second spray, or that applied immediately before the blossoms, is the most important. In the control of the green apple bug it is also the most important and, depending on the season, it may or may not be the most important in the control of fungus diseases.

The directions given in Circular No. 8 of the Dominion Entomological Branch are as follows: Second Spray.

Time.

When blossom buds are showing pink. For canker worm apply slightly earlier; for green apple bug leave until just before the blossoms open.

Material

Lime sulphur 1.007 sp. gr., or about 21-3 gallons to 100 gals. of water (1-43), adding powdered arsenate of lime 2 lbs. to 100 gals. of water.

Application

Drench thoroughly at 200 lbs. pressure, using a Drive nozzle.

Pests Destroyed

Apple scab, budmoth, browntail canker worm, fruit worms, etc. If green apple bug or green aphis are present, add nicotine sulphate, ¾ pint to 100 gals., making sure that every insect is covered with spray. For very severe infestations of green apple bug the trees must be banded with tree tanglefoot before spraying and kept clean cultivated until July 7th.

If the first spray has been applied, the best results will be obtained by leaving this spray until just before the blossoms open. If the first spray has been ommited, this spray should be applied 3 to 5 days before the blossoms open.

If green apple bug is the major pest in the orchard, the poison and the fungicide should be added about one fourth weaker and three or four times as much of the dilute spray used as is ordinarily applied, making sure that every chink and crevice about the blossoms and fruit spurs is dripping wet.

Burning by the Spray

"What is sauce for the goose is sauce for the gander" does not apply to apple trees. The susceptibility to injuhy from spray depends on a number of factors. Trees that are highly cultivated and highly fertilized will stand stronger spraying material without injury than those in sod or poorly fertilized. Some varieties, such as McIntosh Red and Gravenstein, will stand stronger spraying material than others such as Ben Davis. A tree that has few apples on will apparently show less foliage injury than one that is heavily loaded. Spraying after a period of dark weather will usually result in more injury than spraying after a period of bight, sunny weather. Spraying when the trees are wet or damp from rain will result in more injury than when the trees are dry.

In spraying we must remember that last season many varieties, such as Ben Davis, which had not been sprayed, developed marked burning of the leaves which was put down to "spray injury" until it was found that the trees had not been sprayed at all. Poor cultivating and fertilizing are as often the cause of leaf burning as spraying. The lime sulphur arsenate of lime combination as recommended, is the safest and best material that we know of at the present time for this spray, alhough we are hoping to find a better material later on.

Substitute Materials

Bordeaux 4-4-40 or 10-10-100 may be used for this spray. If prepared or hydrated lime is used, a p und or so of excess should be added and the final mixture tested with litmus paper (which can be procured from the druggist) and lime added till the solution turns the paper blue. In adding the hydrated lime to the tank full of copper sulphate solution the agitator should be started before the lime powder is poured in, for the faster the mixture is being stirred when the two ingredients are combining, the better will be the resulting Bordeaux.

The essentials in making this type of Bordeaux are: Stir rapidly while the materials are combining and add lime till the solution turns litmus paper blue. Almost any poison may be used with Bordeaux, but arsenate of lime is the cheapest poison available in the Annapolis Valley today and is perfectly satisfactory.

Nicotine sulphate may be added to Bordeaux, but when the Bordeaux is used for green apple bug spraying it should be very dilute, say 7-7-100 or 3-3-40.

From 5 to 12 per cent of slight russetting will result from the use of Bordeaux for the second spray, and it reduces the value of the poison used with it by almost one half. In spite of these drawbacks, it may prove the best material in many seasons for this spray.

Lead Arsenate, double strength, or 12 pounds of paste lead arsenate to 100 gals. of water with no fungicide. Experiments in Maine and in Nova Scotia have demonstrated the high fungicidal value of, arsenate of lead. We would not advocate anyone relying on this to control fungus in all seasons, but we have great hopes that it will prove of value. When canker worms or other insects are very bad, we would advise the application of this material in preference to the other sprays. For those who are inclined to experiment we would advise one tank of this material at 12 lbs. of paste or 6 lbs. of dry lead arsenate to 100 gallons of water.

Soluble sulphur, 1 lb. to 40 gals., and arsenate of lime, ½ lb. to 40 gals., to which is added 2 lbs. of hydrated or slaked lime. This combination is one of the most rapid killers known, and has up to the present proved safe for one application, but should not be used where soluble sulphur was used for the first spray. The arsenate of lime may be reduced as indicated with ooluble sulphur on account of the sodium present, hastening the action of the poison. We would not advocate a person using more than one tank of the combination in an orchard, until it has been demonstrated safe under all conditions, as it has for one application only, under the fed conditions where it was used in the past.

The fact that this combination costs less than ½ a cent per gallon complete, while lime sulphur arsenate of lime costs almost 1 cent per gallon and arsenate of lead, lime sulphur costs more than 1 cent per gallon, shows us the advisability of testing this material under all conditions in a small way.

Notes

Get litmus paper for testing Bordeaux and add lime till it turns the paper blue.

Measure your spray tank so as to be sure that you are not using your spray too strong.

If you have not got a copy of Circular No. 8, write to G. E. Sanders, Dominion Entomological Laboratory, Annapolis Royal, N. S., for one.

Troubles of the Amateur Gardener

By W.R. Reader, Park Supt., Calgary

Immediate action is the most essential thing in fighting garden troubles of all kinds, and this particularly applies to insect pests. The crop that today is hopelessly ruined by bugs, could, in most instances, have been saved by half an hour's work a few days ago. You notice that a cutworm has destroyed one of your cabbage plants. You say: "I will look for that fellow tomorrow. I haven't the time now. The next night he bites off half a dozen of your plants.

Sometimes the damage occurs because the gardener does not know what symptoms to look for. It is one thing to know the remedy for a thing and quite another to recognize at once when it should be applied.

It may help us if we first of all classify garden ailments and enemies both as to their characteristics and symptoms.

Plant diseases can be divided into four types:—First, those that are termed "purasitical" and are the result of an attack of some fungus or germ, and secondly, those known as "constitutional" and attack the organization of the plant as a whole.

Insect enemies can also be divided into two classes: The chewing and biting insects, as caterpillars, and beetles, and the sucking insects which feed on the juices of the plant as aphides or plant lice.

The cause of plant troubles is often invisible until carefully searched for. Nature protects many of these pests by making them of a color harmonious with their surroundings—the cabbage caterpillar is the color of the cabbage, the cutworm is the same tone of brown as the earth in which he hides. Others hide on the under sides of the leaves or even inside them. Still others carry on their work of destruction in the ground.

Danger Signals

The gardener must, therefort, watch out carefully for the danger signals. Of which the following four are perhaps most noticeable.

Poor color is often an evidence of something wrong. Though the tones of green vary considerably amongst different plants there is a certain tone that is normally shown when a plant is healthy and with which the gardener becomes familiar. When a yellowish tingue is noticed either on individual plants or the whole crop it is time to investigate. The trouble may be due to plant lice, to lack of nitrogen, or to lack of cultivation. It is the gardener's business to determine what is the matter. Wilting is another sign that something is wrong. Sometimes on a very hot day especially after cloudy weather plants will flag a llittle, but it is often a sign that root maggots or stem borers are at work.

Curled and twisted leaves are usually a sign that aphides are at work. These must be attended to at once for the longer delay tht more curled will the leaves become and the more difficult will the pests be to reach. Stunted growth is not always a sign that an enemy is at work, yet this condition invites the attacks of every kind of pest. When a plant is in good soil, well cared for and growing vigorously it is less liable to attack.

When cabbage and allied plants assume a sickly color with retarded growth it often means that they are attacked by club root. Top dressing with nitrate of soda and bonemeal and hilling up to stimulate growth and root action may overcome the trouble. To prevent clubroot the land should be dressed with lime before planting. Careful watch should be kept on the inner leaves of the plants. If found to have been eaten, a search must be made for the green cabbage caterpillar If too numerous for hand picking apply kerosene emulsion with Paris Green This being a poison, cannot, however be used after they have begun to head.

A wilting of the whole plant usually means that the root maggot is at work. Pull and burn all affected plants, and stimulate growth of the others as for clubroot.

A premature dying of the tops of onions is often caused by "thrips", minute yellowish insects. These insects are only present during dry spells. Kerosene emulsion or soapy water in which tobacco has been steeped will drive them away.

Besides the special troubles that I have mentioned there are other pests that attack several classes of plants.

MAKES HARNESS STRONG & TOUGH

EUREKA HARNESS OIL makes harness strong and tough.

This mineral oil not only takes dirt off but keeps dirt out. It fills the pores of the leather.

That is why a harness treated with Eureka is tough, pliable, shiny and new looking.

E. L. Colpitts, Petitcodiac, N.B.

Posssible the most serious that concerns us is the cutworm. There are a number of kinds of these, the larvae of several species of noctua moths. A description is hardly necessary, as I suppose everyone is familiar with the animal.

For single plants as tomatoes and cabbages protection may be given by encircling collar of tin or tar paper. Where this cannot be done use poisoned mash. This is made by mixing Paris Green with bran at the rate of one pound of the former to 50 lbs. of the latter. Moisten with water that has been sweetened with molasses or sugar. Scatter over the surface of the infected area. Cutworms generally feed at night and will take the bran only when moist. For these reasons it is best applied during the evening. Make it a rule to find the worm wherever a several plant denotes that one has recently been at work. The flea beetle, a minute, black, hard-shelled and very lively insect is often very trouble some to cabbages, turnips, and radishes. They come in swarms and if neglected will soon destroy a crop for they attack while the plants are quite small. It seems impossible to poison these, but fine dry air slaked lime dusted over the soil and plants often acts as a preventative.

For all insects that eat the leaves of plants internal poisons, as Paris Green or Arsenate of Lead should be used. Arsenate of lead has the advantage over Paris Green that it remains on the plant longer. For sucking insects contact poisons must be used. These consist of kerosene emulsion, solutions of soap and tobacco, tobacco dust and lime dust.

It must be always remembered that wherever pests are once allowed to gain a foothold any of the suggested treatments are likely to prove only partially successful. The better plan is never to let them get a start Keep a sharp outlook for danger signals, keep your plants in a healthy and vigourous condition, cultivate frequently, and allow no refuge to accumulate to serve as a refuge for eggs and germs. Keep on hand ready for instant use a sprayer of some kind, a powder puff, and a supply of ammunition.

Kerosene emulsion is made by boiling half pound soap in 1 gallon of water. Remove from fire and add 2 gallons of coal oil while still boiling. Churn this till thoroughly mixed.

For use dilute with 9 parts water, so that the 3 gallons of stock solution will make 30 gallons of spray mixture.

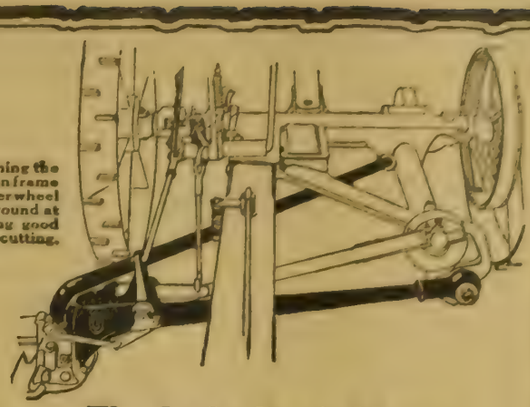
To this add 2 ounces Paris Green, first mixing the Paris Green like mustard with hot water.

Paris Green is a poison and must therefore be handled carefully.

CURING HORSE THAT HALTER PULLS

Some horses develop the bad habit of pulling back when tied so that they break their halter ropes. This, and the habit of hanging back when being led can be overcome by the following device:

Take a good rope, long enough to tie round the horse's body and then on as long as the user wishes. Use one that is strong enough so that the horse will not break it the first time it pulls back, as this is the time that will decide the cure. Tie the rope round the horse's body just back of the forelegs with a good knot that will not slip. Place the knot just up even with or a little above the base of the neck and run the free end of the rope through the halter ring. After leaving the horse tied and having led it with this arrangement for several days, the rope may be tied round the neck of the horse, and the free end run through the halter ring as before. Later, the horse may be led by the halter only.



The manner of joining the drag-bar to the main frame insures that the inner wheel will stay on the ground at all times, providing good traction in tough cutting.

Deering—The Light Draft Mower

HAVE you ever noticed the extra long drag-bar of the **Deering** mower, its connection to the frame, and the way it supports the cutter bar? It is one of the exclusive and outstanding good features of the **Deering**, and an important reason why this mower has built up a reputation for light draft and great cutting power.

Through the use of the continuous dragbar, the cutter bar has a flexible movement and floats lightly over even and uneven ground. You can test this by taking hold of the end of the **Deering** cutter bar and noting how easily you can lift it.

The weight of the cutter bar being entirely on the wheels, the traction is increased and the wheels prevented from slipping or being lifted from the ground.

The **Deering** mower has many other good features. You should write for complete description, or better still, examine the mower. Made in the desirable sizes.

Deering rakes, tedders, International side delivery rakes, loaders, and hay presses are machines that save time and labor in the hay field. Write for complete information.

EAST—Hamilton, Ont., London, Ont., Montreal, Que., Ottawa, Ont., Quebec, Que., St. John, N. B.

With a little care and patience, the worst cases may be cured by the above method, although with this, as with all things, an ounce of prevention is worth more than a pound of cure. If one is careful with colts when teaching them to lead, and will use this method, they wil always lead up well. One should never tie a colt by the neck or even by the halter, until he learns to lead up with the body tie, and then he will never pull back.

AN AVERAGE TEST

It is well known that the percentage of fat in milk varies considerably, and for various reasons; but if an average is to be struck for any cow, it must be on the known total weight of milk and fat. Then an owner can say (and not till then can be speak from actual knowledge) "this cow averaged a 3.0 test last year, and that cow averaged a test of 3.9". The total weights can be estimated from three days' weighings per month, and one monthly test taken from samples of those weighings, during the full period of lactation.

The 3.0 average test may mean more weight of fat per year or again it may not. One thing is certain, it is only possible to know by weighing and sampling regularly. Can you say definitely that each cow you own gave over 240 pounds of fat last year?

Record forms for milk can be obtained free of charge on application to the Dairy Division, Ottawa. It will pay every dairyman to take up cow testing, keep his best cows and increase the total and average yield of the whole herd. C. F. W.

DAIRYING.

THE DAIRY COW.

BY
E. S. Archibald, B.A., B.S.A., Dominion Animal Husbandman.

It has been clearly demonstrated that the good dairy cow is a more economical producer than any other farm animal. Not only does she actually yield more product from a given amount of feed but she does this at the least cost and greatest profit.

Notwithstanding these facts the production of milk and fat from the average cow is exceedingly low, being approximately 3,800 pounds milk and 130 pounds fat per annum which in value is less than the total cost of production. Nevertheless it has been clearly demonstrated that by better feeding and management this average may be easily increased from 30 to 80 per cent with an increased cost in feed and labor of only 10 to 20 per cent; the margin would be largely profit. Such an increase is not only a financial necessity but the patriotic duty of every dairy farmer.

FEEDING THE DAIRY COW.

The milk produced by a dairy cow of proper type is in proportion to feeds consumed plus the reserve of feed stored in the body as fat and flesh. As an example of the latter it has been shown that fresh cows may be fed on a maintenance ration or even starved for several days yet produce milk in fairly large quantities with, however, a proportional decrease of weight and flesh. Again it has been proven that cows of proper type having a store of flesh before calving will not only milk more heavily but also more persistently during the succeeding milking period. It is clear, therefore, that this supply of fat and flesh stored on the dry cow of dairy type will be drawn upon when most needed and be either given off as milk or so take the place of feeds consumed in supplying bodily needs that a larger proportion of these feeds may be utilized for milk production.

The dry cow receives little attention from the majority of dairy farmers. The thin cow at calving is in poor condition to make milk profitable and cannot produce the rugged healthy calf fitted to withstand the many calf ailments. Allow the cow four to ten weeks before freshening. A pound of meal a day during this dry period is worth as much as two or three pounds of meal fed after the cow has freshened. On poor pasture, feed the dry cow green feed, silage or roots and a grain ration composed of two parts of any two of the following meals: bran, ground oats, ground corn, ground barley, plus one part ground oil cake. To the thin cow feed 4 to 7 pounds daily; if the cow is in good flesh, give roughage as needed and 1 to 2 pounds daily of the above-mentioned grain mixture; if the cow is fat withhold the grain, but on the other hand do not sacrifice flesh or lose a thrifty condition.

FEEDING AT CALVING.

Feeding the cow at calving requires special care, varying with the individuality of the animal. Be sure that the condition of the bowels is normal. Constipation at this time is apt to induce many troubles such as milk fever, caked udder, etc. After calving give a tepid drink containing a handful of linseed oil meal per pail of water, allow to rest quietly for twelve hours, after which give a warm bran mash, with two bran mashes on the second day after calving. Feed a limited supply—6 to 8 pounds—of clean hay, preferably clover. Draw a little milk three or four times daily for the first three days; do not milk dry until after the third day, as such a procedure frequently brings on milk fever. On the fourth day start the dry meal ration consisting of 4 pounds equal parts bran and ground oats. Increase the quantity of grain and strength of the grain mixture to a full grain ration on or about the sixteenth day after calving.

FEEDING THE FRESH COW.

The feeds consumed by a dairy cow in milk are utilized for two purposes, viz., the manufacture of milk and the maintenance of the body. The cow weighing 1,000 pounds requires the equivalent of 100 pounds clover hay and 10 pounds oat straw or 35 to 40 pounds of mixed pasture grass for maintenance alone. To this must be added the feed to supply energy necessary to manufacture milk. It is evident that the meagre feeding of cows in milk will induce little if any milk flow after the surplus body tissue has been used, while liberal feeding with practically the same maintenance requirements will induce heavy milk production.

It is evident that milk produced under the latter conditions will cost much less per gallon.

RATIONS FOR THE MILCH COW IN STABLE.

The foundation principles of the successful selection of feeds and the feeding of dairy cattle depend upon the palatability, variety, nutrition and ease of digestion, and succulence of the ration given. All these essentials of a well balanced ration for economic production must be considered when raising or purchasing foodstuffs.

The most economical ration must have as a basis cheap but rich nutritious farm grown roughages such as clover or alfalfa hay, ensilage and roots. The liberal feeding of meals is advisable to balance the roughage ration and in addition to provide the heavy milking cow with an extra supply of nutrients in a less bulky form.

A pound of grain when the cow is fresh is equivalent to several pounds of grain after the cow has decreased materially in her milk flow. Feed one pound of meal for every 3½ pounds milk produced; as her lactation period progresses decrease the meal gradually to 1 pound for every five pounds of milk produced. A fair average is 1 to 4. Following are a number of well-balanced daily rations for the 1,000 pound dairy cow suitable to the individual needs of farmers throughout different parts of Canada.

No. 1.—Mixed hay 16 pounds, turnips or mangels 40 pounds, meal mixture composed of bran 4 parts, ground oats 2 parts, ground barley 2 parts, oil cake 1 part, cottonseed meal 1 part. This meal fed at the rate of 1 pound per ½ pounds of milk produced.

No. 2.—Clover or alfalfa hay 10 pounds, mangels or turnips 30 pounds, oat straw 10 pounds, meal mixture composed of bran 5 parts, ground oats 2 parts, linseed oil meal 3 parts, fed at the rate of 1 pound per 3½ pounds of milk produced.

No. 3.—Clover hay 12 pounds, corn ensilage 30 pounds, meal mixture composed of bran 7 parts, ground oats 7 parts, dried brewers grains 4 parts, cottonseed meal 2 parts, fed at the rate of 1 pound per 3 pounds of milk produced.

No. 4.—Mixed grass hay 10 pounds, oat straw or chaff 10 pounds, mangels or turnips 40 pounds, meal mixture composed of bran 3 parts, ground oats 3 parts, ground flax 2 parts, ground wheat 2 parts, fed at the rate of 1 pound per 3 pounds of milk produced.

No. 5.—Brome hay 10 pounds, clover hay 5 pounds, oat straw or chaff 10 pounds, mangels or turnips 30 pounds, grain mixture composed of ground oats, barley and wheat, equal parts, fed at the rate of 1 pound per 3 pounds of milk produced.

A plentiful supply of clean drinking water and salt is essential for greatest health and production.

FEEDING ON PASTURE.

Over large areas of Canada the milk produced on grass will always be the cheapest. Hence the proper care of pasture is most essential. If cattle are allowed on the pasture only after the grass is from 6 to 8 inches in height such pasture will yield most feed during the summer and will be best prepared to withstand drought.

Natural pasture may be supplemented in the spring and fall by sowing a patch of fall rye, or during the summer months by seeding an annual pasture mixture composed of oats and barley or a mixture of oats and clover. The most successful dairymen as a rule feed a limited grain ration even when the cows are on pasture. Bran 3 parts, cottonseed 1 part, or bran 2 parts, ground oats 2 parts, and gluten

"The Canadian farmer hands his money to the Canadian manufacturer who in turn pays wages to his employees. The money is then turned over to the Canadian merchant for produce bought from the Canadian farmer. Therefore money paid out by the Canadian farmer for Canadian made machinery comes back to him in actual cash, and in the form of better markets for his produce. Money paid for foreign made machines is immediately sent out of the country, perhaps never to return."

PRACTICAL PATRIOTISM

In these times of national stress, the Country implores the people to conserve every resource. Keeping your money investments confined to Canada is splendid patriotism, and good sound business too. Besides, you can easily prove to yourself that it is profitable patriotism for you to invest in the

Standard

—the machine that is entirely made and designed in Canada by Canadians. Every cent you invest in the Standard helps to maintain Canada's own resources and to build up her strength. But the Standard relies not upon your patriotism alone—

The Standard saves one-half pound of valuable cream per cow per week over other machines. By its unequaled close skimming it gets all but one tenth pound of butter fat from 1000 pounds of milk skimmed, while other separators lose one-half to a whole pound.

This saving may seem small until you realize what it means to you. With, say, eight cows, it mounts up to four pounds of extra butter-fat every week. At 30 cents a pound, butter-fat price, you make an extra profit of $1.20 per week, or, in 40 weeks of milking, $48.00. We will accept this amount as first payment on your new Standard. **With eight cows, your Standard pays for itself out of savings! Will it not pay you handsomely to replace your old machine and get the Made-in-Canada Standard?**

The Standard's close skimming is proven by Government Dairy Schools Tests. We are always glad to have the Standard tested beside any other separator, wherever made.

Send for interesting literature, also describing the Standard's self-oiling system, low supply can, interchangeable capacity, etc., etc.—features that are creating a big demand for this Made-in-Canada machine all over Canada, in the United States and other countries. Write to-day.

or ground peas, 1 part, will give excellent results.

SUPPLEMENTING PASTURES.

In the shortage of grass provide good soiling crops. Supplements to pasture are peas and oats seeded at different dates, second cut clover, corn and fall turnips fed with tops as pulled. Summer silage, if available, is both superior to and cheaper than peas and oats.

THE FEEDING OF CALVES

The quality of and the profit from the future herd depend upon the breeding and quality of the calves and even more on the method of rearing. The best of calves both as to type and breeding may by poor rearing develop into small stunted and unprofitable cows while poorer calves by good rearing may develop into very useful animals. Hence the subject of calf rearing is one of great economic importance.

The following methods with such variations as are needed will give excellent results:—

Remove the dairy calves from the cow at birth. Do not allow them to suck, unless weak or unable to drink, or unless the cow's udder is severely caked. Mother's milk for the first four days, at the rate of 8 to 10 pounds divided into three or four feeds, is essential Feed whole milk for the first ten days, then start replacing part of the same with skim milk so that when the calf is one month of age, it may be receiving in two feeds daily, 12 pounds of skim-milk plus a tablespoonful of finely ground scalded flaxseed jelly.

At three weeks of age feed a small quantity of whole oats in the manger, Fine clover hay and clean water might profitably be kept before them from this time on.

During the next fifteen weeks gradually increase the skim-milk to 15 to 20 pounds daily. Add to the flaxseed jelly other constituents to make a cream substitute as follows: Fine ground flax 1 part, fine ground oats 2 parts, ground corn 2 parts. Feed in the milk divided into two feeds daily at the rate of one-eighth pound at the start and increase to 1 pound.

Replace the whole oats at four weeks of age with a grain mixture of equal parts bran, rolled oats, and ground corn. Start the calves on one-eighth pound per day and increase gradually to 1½ pounds daily at twenty weeks of age when the skim-milk may be gradually cut off and this grain ration increased proportionately.

Do not expose your calves to heat and flies but during extreme heat keep them in a dark cool box until four months of age after which they may have a night paddock. If fall-dropped calves keep in a clean, bright comfortable warm box stall. Feed a limited amount of roots or a mixture of roots and ensilage. Feed salt in limited quantities regularly and water as required.

RULES IN FEEDING AND MANAGEMENT.

1. Never overfeed.
2. Feed according to the individual needs and desires of each animals.
3. Feed regularly both as to the hours of feeding and the character of feeds. Sudden changes in feeds will cause not only a loss in gains or production, but will often induce ailments herewith emphasized.
4. Common ailments such as diarrhoea, impaction, bloat, grain sickness and caked udder usually result from incorrect feeding. Prevention of these troubles is surer and certainly cheaper than the cures.
5. Other ailments such as milk fever may be largely prevented if the cow is properly fed and managed before and after calving.
6. Comfortable stables having a plentiful supply of fresh air and sunshine and pastures where ample shade and water are available, will go far toward increasing production at a decreased food cost.

Has self-centering bowl; detached spindle

Every De Laval equipped with Bell Speed-Indicator

NEW DE LAVAL CREAM SEPARATOR

THESE are the days when you are getting *more milk in the pail*, and with butter-fat at its present high price you want to be dead sure that you are getting *all the cream out of the pail.*

You certainly can't afford to feed butter-fat to the calves and pigs at from 30 to 40 cents a pound.

All sorts of *"claims"* are made for various cream separators, but what you are looking for is *"proof."*

Here is the most convincing kind of proof that the De Laval is the cleanest skimming machine:

Fifteen years ago there were a dozen different makes of creamery or factory separators in use.

Today the creamerymen and large milk plants the world over use the De Laval almost exclusively. In fact, it's hard to find a large cream producer or creameryman who will allow any separator other than a De Laval in his plant, no matter what the price.

Why? Because they have found that it makes a difference of several thousand dollars a year to them whether a De Laval or some other make of machine is used. They simply can't afford to use any other machine.

This is proof of De Laval closer skimming that you can't afford to ignore. Even if you don't separate as much cream as the creameryman, you can't afford to waste it any more than he can.

Your local De Laval agent will be glad to let you try out a New De Laval on your own place. If you don't know the local agent, write to our nearest office for catalog or other information.

LIVE STOCK.

SHEEP AND DOGS AGAIN

During the past few years no kind of live stock has equaled sheep in profitable returns. We long ago learned that native sheep in large flocks in the midwest states could not be kept healthy permanently, but that small flocks could. A flock of from 15 to 50 ewes will bring a greater net return on the average farm than any other like investment. Nearly every cornbelt farmer would keep such a flock but for the destruction wrought by dogs. Because of dogs comparatively few farmers in the middle west make any attempt to maintain flocks. The total of profits lost reaches a huge sum. The paradoxical feature of the situation is that we have dogs in almost innumerable numbers solely because farmers want them.

If the farmer chose to keep and raise sheep at a profit instead of dogs at a loss conditions would be reversed. If a majority of farmers in any state were really united in a desire to get rid of the dog menace, they could easily obtain and have enforced such legislation as would accomplish that purpose. Why do they not do it?

The pointer's and the setter's unefulness has almost gone in this section, with the disappearance of the quail in any considerable numbers; the joy of the foxhunt has been banished by the prevalence of barbewire fences; Coolies are no longer needed to care for flocks that have no existence; the stag-hound no longer finds deer to chase; wild animal life has become so scarce that the "varmint" dog does not pay for his keep, while the rat dog alone is left with plenty of work to do.

Since the dog has become so largely useless, the reason for the farmer's persistence in raising and keeping dogs must rest on sentimental grounds It is the surviving instinct of forgotten days when the dog was man's work animal, his helper in the chase and companion in lonely cave or cabin? If so, it is a remarkable instance of the survival of an attachment the reasons for which have long ceased to exist. Is this attachment founded on the undeniable fact that the dog is a faithful, intelligent and companionable? But is not the horse just as intelligent, faithful and almost as companionable? Is it because the dog is more obedient and subservient to man? Most dogs will, to a greater or less degree, obey the master's command and fawn upon the hand that wields the lash. Does this so gratify man's vanity that he finds pleasure in association with even a sheep-killing dog? Or is it that man loves and keeps his dog because it is the one thing of which he is overlord, which he can kick with impunity, and which becomes more servile under abuse? Perhaps there is something in this thought because the "ornriest" man keeps the most and the "ornriest" dogs.

One thing is certain: Town and country people are agreed in both belief and practice as to the desirability of keeping dogs. Probably the city dweller is the greater offender, for to gratify his whim he keeps dogs that are denied even a place in which to roam and are to all intents and purposes unhappy captives in a cage. But what does the dog's misery if the man or poodle-dog woman can gratify his or her feeling of mastery and display? I have witnessed the killing and mutilating of scores of sheep and lambs by marauding dogs, sometimes town dogs, but often country dogs and the nearest neighbor's. I have seen sheep and lambs after such attacks still alive, with eyes torn out and entrails dragging on the ground. In veterate hunter though I am, and lover of good dogs, second to none, the mute and helpless look of suffering in such instances appealed to me with a greater force than any affection I have for any dog. I have seen the man who owned a dog that did this cruel thing fight the man who killed the dog for doing it. I have thought that the man aroused to action by the suffering of helpless sheep that never harmed man or beast was a better man with better instincts than he who contended for his dog, no matter how much he loved it.

To my way of thinking, the man who wants to keep a dangerous animal like a dog that is or may be a menace to man and beast should be required to take such precautions as will prevent wrong and injury to others. If he will not do this of his own volition, then the law should take both him and his dog in charge before others suffer loss or damage. Much has been said and written on this subject, and much will be spoken and printed, but the dog still holds supremacy, especially the mangy, homeless, friendless cur, while the sheep is banished and mutton grows scarcer and woolen clothes are out of the reach of most dog-owners.

In Breeders' Gazette R. E. Culver.

UNTHRIFTY PIGS.. ..CAUSED BY WORMS

I have been having trouble with my hogs for some time. They seem to thrive and do fairly well until from three to five months old, when they stop thriving but continue to have a ravenous appetite, but no matter how much or how little we feed they gain very little in weight. Occasionally we slaughter one for home use and find when cleaning the intestines many long, white worms, and some times large bunches in one place. Would this be the cause of them not growing? If so, would you kindly give me a remedy. They seem to keep fat, but do not appear to grow. The worms are in the small intestines. J. K.

There is no doubt but that the worms are the cause of your pigs not growing properly. These parasites are quite common amongst swine herds and do a great deal of damage. Herds where this trouble exists should be treated once or twice should be treated once or twice a year to overcome the difficulty, at least whenever any symptoms are shown of their presence. They may even be present in quite a number and the swine not show it much where well fed and in good quarters.

Turpentine, santonin and calomel are the drugs most used for destroying intestinal worms. In treating hogs, the best and easiest method of giving the remedy is in the feed. It is best to divide the herd into small lots of five or ten and dose each lot separately. If ths is not practised all will not receive the proper dose. Drugs like santonin and calomel, that are insoluble, should be mixed with ground feed and fed in a through. Drugs like turpentine and gasoline that form an emulsion are best given in this manner. Turpentine is a cheap and convenient remedy. The dose is one teaspoonful for every eighty or one hundred pounds of live weight. Give it in the morning after the pigs have been without food for 14 hours. The dose should be repeated daily until three doses have been given.

Santonin and calomel are also very effective remedies. Five grains of calomel or eight grains of santonin may be given for every one hundred pounds of live weight. These drugs should be put in powders large enough for the lot of five or ten pigs and fed in ground feed.

THE COW THAT IS HARD TO MILK

How can a tough milk cow be made easy to milk?

What is the cure for warts on cows' teats? I would appreciate answers to these question at your earliest opportunity. A. J. C.

Ordinarily a cow may milk hard because the sphincter muscles in the teats contract very tightly. Of course the purpose of these muscles is to close the ducts and prevent the milk from leaking out, but with a hard milking cow they contract so tightly that it is hard to force out the milk when milking.

Then to make such a cow milk easier, it is necessary to use something to relax those sphincter muscles. Teat plugs, which are made of lead or hard rubber, are used for this purpose. The plugs are inserted into the teat ducts and kept there from one milking to another. In one end of each plug is an eye. A piece of tape can be run through this and tied around the teat to keep the plug in place.

Sometimes a bistoury is used to make a cow milk easier. This is a small instrument containing a little knife blade. It is easily pushed into the teat duct, the knife thrust out and removed before the animal realizes what has happened. This should not be used when the cow is dry.

In using the teat plug or bistoury, special care should be exercised to disinfect the instrument and the teat otherwise there is danger of infection. Wash the instruments and, if possible, let them stand for a few minutes in boiling water. Then disinfect with a 5 per cent. solution of carbolic acid or with one of the coal tar disinfectants. Insert the instrument without touching the part that enters the teat.

Common warts can be removed by tying a thread or horse hair around them tightly at the base and then touching the place where the wart has been with carbolic acid.

Another method is to be rub the warts thoroughly once or twice daily with castor oil, olive oil or goose grease.

Large warts may be twisted off and bleeding stopped by applying a red hot iron.

AVOID FARROWING IN FALL.

Articles are being published everywhere urging an increase of meat production. This is justified because of a decrease of total numbers of livestock during the past five years, accompanied by a considerable increase in consuming population. Much of the advice given concerning the holding and breeding of livestock is good, but occasionally someone is over enthusiastic and urges methods that are impractical. One such piece of advice advocates immediate breeding of sows for fall litters. This is probably good advice for sections having fall pastures. It is not good advice for Colorado. Sows bred now would farrow in September, and by the time the pigs would be old enough to make use of pasture, there would be no further growth of alfalfa. This means that pigs would have to be raised during the winter on grain. It is a well established fact that fall litters in this state make much slower growth than spring litters, and every pound of grain costs more. The grain fed to such pigs furnishes more human food than the pork produced from the grain. The best thing to do in Colorado is to run your dry sows and fall gilts through the summer, breeding them for late winter litters to be farrowed in February and March of next year.—G. E. Morton, Colorado Agricultural College, Fort Collins, Colorado.

PROFITABLE BEEF PRODUCTION.

Experimental Farm, Nappan, N. S.

The results obtained at the Experimental Farm, Nappan, in feeding good butcher steers, heavy fed, versus good stockers, heavy fed, were as follows:—

Eight steers were selected and divided into two lots of four each, the four being in such a condition as would class them as good butchers, the other four as good stockers. All steers had the same treatment, that is, dehorned and fed a preparatory ration until they became accustomed to their feed and surroundings.

The four good butchers, or lot 1, heavy fed, weighed at the beginning of the period 4478 pounds, at finish 5355 pounds, an increase of 877 pounds in 93 days.

The good stockers weighed 4573 pounds at the beginning and at the finish 5295 pounds, an increase of 722 pounds in the same period.

The original purchase price was, unfortunately, the same in both cases as the steers were purchased together under ordinary buying conditions or the good stockers would have been purchased at a cheaper price. The price was 6.25 cents per pound, live weight, and the selling price was 8.1 cents in both cases, as they were all sold together.

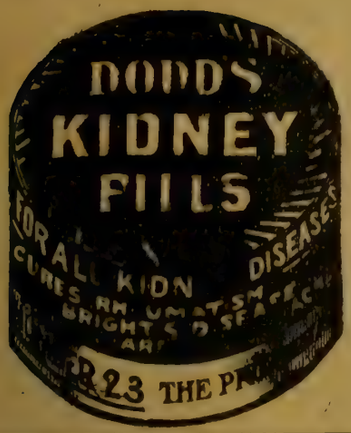
The gross profit for the good butchers was $153.88, for the good stockers $139.81. The total cost of feed for lot 1, good butchers, for 93 days, $99.16 and the same cost for lot 2, good stockers, length of period and feed being the same, having a net profit per steer of $13.68 for lot 1 and $10.98 for lot 2, a difference of $2.70 in favour of the good butchers.

The average profit per steer for three years for good butchers, heavy fed, was $18.38; for good stockers, heavy fed, $16.06, a difference of $2.32 in favour of good butchers, heavy fed.

The average cost for three years to produce 1 pound of gain in good butchers, heavy fed, was 10.33 cents; for good stockers, heavy fed, 11.08 cents, a difference of 0.75 or ¾ cent per pound in favour of the former. The ration fed to both lots 1 and 2 was at the beginning of the period 60 pounds roots, 6 pounds meal, 1 pound molasses. At the finish 40 pounds roots, 16.5 pounds meal and 2 pounds molasses.

The meal mixture was made up as follows,—200 pounds ground oats and barley, (equal parts by weight), 200 bran, 50 oil cake, 50 cotton seed. The cost of same was $1.50 per hundred weight. Roots were valued at $2.00 per ton, hay at $8.00 per ton, molasses 20 cents per gallon.

The above results would indicate that with selling prices the same, the greater profit would be realized from feeding good butchers, but the prices under ordinary conditions at purchasing and selling time would show a greater difference than the above, which would undoubtedly bring the good stockers up a little. In any case the better finish will give the good



butchers a still greater advantage at selling time, so that we must conclude that they are the more profitable, more especially for a short feeding period.

DEVICE FOR THROWING ANIMALS

By John Brander, Nesbitt, Man.

Judging from contributions to your columns, a number of your readers are up against the problem, at times, of knowing how to throw an animal and secure him while an operation is being performed, such as putting a ring in the bull's nose, sawing off his horns, castration, treating for lump jaw or for any other purpose. I have quite a novel plan that I used a good many years on nearly all animals thrown, from a pig to a horse.

It consists of some 30 to 40 feet of half inch rope on two double pulleys made for purpose, with a self locker on one pulley. It is a "block-and-tackle" and sold for the purpose of stretching barb wire. Take a two-year-old bull, for instance. Tie a piece of good strong rope to one front leg, then forward round a post and to his other front leg. The rope should be about two feet high as it passes round the post and held from falling down. Take another piece of rope (the stronger the animal the stronger be the rope) and tie it to one hind leg, leaving a foot or two, and then tie to other hind leg. There then should be a post 8 or 10 feet away but directly behind him, to which fasten the block-and-tackle some 4 or 5 feet high and hook the other end to the rope on his hind legs. Draw his hind feet from under him by pulling on the rope and the bull will fall on his side, and by a slight effort he may rolled on his back. By placing a stick of wood at each side, he is there to stay, ready for the operation.

The plan works as successfully on a month old calf or a cow. I have used it successfully while castrating two-year-old colts. As our stable is large and solidly built, we do all this work in it where we have easy access to plenty of posts.

The cost of pulleys and rope is somewhere from $2 to $3 and, if cared for, will last for 10 or 12 years. The pulleys are exceedingly handy to have on the farm for hoisting a pig butchering, stretching wire on a fence, and for many other purposes and is well worth its cost. It saves a lot of hard work and worry.

Concrete Machinery for Farm Use
(MADE IN CANADA.)

DININFECT AND CLEAN YOUR BARNS

Farmers are constantly advised to disinfect their stables, hen-houses, calf pens, etc., but some do not know how to proceed to do it effectively in all cases. The following explicit directions will be found useful and might well be fi ed for future reference.

Chemical disinfectants are used to good advantage in controlling disease and the following directions for ther use are given.

1. Sweep ceilings, side walls, stall partitions, floors and other surfaces until free from cobwebs and dust.

2. Remove all accumulations of filth by scraping; and if woodwork has become decayed porous or absorbent, it should be removed, burned and replaced with new material.

3. If floor is of earth, remove four inches from the surface; and in place where it shows staining with urine, a sufficient depth should be removed to expose fresh earth. All earth removed should be replaced with earth from an uncontaminated source, or a new floor of concrete may be laid, which is very durable and easily cleaned.

4. The entire interior of the stable, especially the feeding troughs and drains, as well as milking stools and all other implements, should be saturated with a disinfectant, as cresol compound or carbolic acid, six ounces to every gallon of water in each case. After this has dried, the stalls, walls and ceilings may be covered with white-wash (lime wash), to each gallon of chloride of lime.

5. All refuse and material from stable and barnyard should be removed to a place not accessible to cattle or hogs. The manure should be spread on fields and turned under. In addition, the yards should be disinfected by sprinkling liberally with a solution of copper, sulphate, five ounces to a gallon of water.

The best method of applying the disinfectant and the lime wash is by means of a strong spray pump, such as is used by orchardists.

This method is efficient in disinfection against most of the contagious and infectious diseases of animals, and should be applied immediately following any outbreak, and as a matter of precaution it may be used once or twice yearly.

TREATMENT FOR LUMP JAW

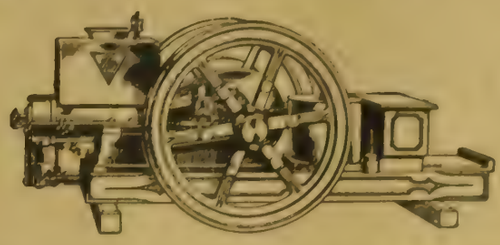
I have a cow which I think has lump-jaw. She is a valuable 3-year-old heifer, and I would like to know through your paper if it would be all right to use the milk from her, or sell the cream, and if you know of any treatment that would cure it?

M. J. R.

Medicinal treatment of this disease consists in giving each affected animal one drachm of iodide of potassium three times a day in a solution of soft feed till the effects of the drug are visible in the production of clavering at the mouth, tears in the eyes, loss of appetite and scurfiness of the skin; then stop it for a week or ten days and repeat. This condition will develop so as to be seen usually in form ten to twenty days. A couple of months or so of this treatment will usually cure all those affected in the soft tissues. The above dose is right for a three-year-old steer weighing fourteen hundred pounds; smaller and younger ones should get proportionate doses. As soon as an animal shows signs of having the disease she should be isolated and kept there until cured or destroyed.

The meat or milk of an animal affected with this disease should not be used for food for man or beast.

ALPHA



—the engine that takes the work out of farmwork

An Alpha will saw more wood in a day than you can saw by hand in a week.

It will pump water all day long without watching.

It will run your separator, churn or washing machine.

It will run a thresher, feed cutter, or silo filler.

There will not be a day when you cannot find some way in which your Alpha will save time, money and labor for you.

Owning an Alpha is cheaper than hiring someone else's engine. The money you now have to pay out for engine hire when you need power, and the greater amount of work you could do if you had an engine of your own would soon pay the cost of an Alpha.

The Alpha is a simple, powerful engine that will give you more reliable service and cause you less trouble than any other engine you can buy.

Ask for catalogue, prices and complete information. Made in eleven sizes, 2 to 28 H. P. Each furnished in stationary, semi-portable or portable style, and with hopper or tank cooled cylinder.

THE HORSE

TREATING HORSES THAT BECOME AFFECTED WITH SYMPTOMS OF AZOTURIA

There is no other disease that has as many terrors for the horse owner and the veterinarian as has azoturia. Veterinarians are able to diagnose the condition in practically one hundred per cent. of the cases, but out of one hundred veterinarians it is doubtful if you would find ten that would agree on just what was the cause of the condition, and among this number you would find just as much variance in the treatment of thiscondition.

This disease is a cold weather disease as we see much more of it during the cooler months of theyear, and very seldom during the hot months of the year. It usually occurs after a short period of idleness and usually in young growing horses, but does occur in older horses. It is much more severe as a rule in city horses than it is in country horses, which is due, no doubt, to the more concentrated feed that they receive, and the more violent exercise that they receive. In city horses it many times comes on so suddenly that the driver has had no warning of it and the horse suddenly goes down. In country horses, however, you will usually have ample warning that it is coming on, as the symptoms appear before the disease is well established. A larger number of city horses die in proportion to those affected than do country horses.

It remained for a western veterinarian to announce a theory that seems to be the best that has been offered to date, and one which will stand investigation pretty thoroughly. This they have termed the mechanical theory.

The horse at rest is many times fed rich nitrogenous feed that makes the blood thick and heavy. The circulation becomes sluggish, due to the lack of exercise. The great amount of nitrogenous material in the blood will make the muscles of the blood vessel walls flaccid and weak. They do not have their normal elasticity. While on the other hand the nervous system is stimulated and the horse is feeling exceptionally good. You rarely see a horse come down with azoturia that did not feel better immediately preceding the attack than he has for some little time. The horse is taken out to work or for use of any kind and since he is feeling so good and his nerves are stimulated so highly, and the blood vessels are weaker than usual the exercise that he receives for the first few minutes causes his heart to work much faster than usual and in fact the horse will work the heart more in a few minutes than it would ordinarily in a much longer time, thus it pumps large quantities of blood into the blood vessels that are not in shape to handle this large amount of blood and this makes the animal very excitable and brings about a paralysis of the particular muscles in which this blood has stopped. Most times if the animal is stopped when the symptons are noticed a rapid recovery takes place as the vessels rid themselves of the large amount of blood and in a few hours the horse is normal. If, however, rest is not given at once, the vessels become totally unable to remove the large quantities of blood that was pumped into these parts and it is only a matter of several hours until it has coagulated and then the animal dies with symptoms similar to apoplexy.

Azoturia usually manifests itself in a number of ways. Some horses will act very much like a horse with an attack of acute indigestion and will look around at the flank occasionally and show quite a little pain, and even get up and down a few times. Others will show an affection of the muscles of the fore limb or of some other group of muscles. Many of them will show a marked lameness in one hind leg and rarely in both, together with a marked swelling of the muscles over the loins. Some horses are so very nervous that it is almost impossible to give them medicine by way of the mouth.

Now, in city horses they almost always go down, even with all that the veterinarian may do. But the cases in the country are more mild and many of them, if receiving good care and attention will remain upon their feet throughout the attack. The animal that does not recover enough to get upon its feet at the end of forty-eight hours is very apt to die. The majority of those that recover will get up at or before the expiration of twenty-four hours. A few will remain down for several days and then recover, but these are exceptions to the rule.

Horses that go down with this condition should not be put in slings, neither should they be raised up in them, as it does more harm than good. Horses that are down should be turned over every three or four hours. Horses that can not get up with the aid of a couple of strong fellows lifting on the tail, very rarely get up or stay up very long, even when slings are used. When the attack is coming on do not fight the horse in an effort to keep it on its feet, because the exertion that you cause it to put forth in trying to stand will only aggravate the condition. If the horse wants to lay down, let it do so, and then make it as comfortable as possible. Rest is the most essential thing in the treatment so stop the animal as soon as something is noticed to be wrong, and keep the animal as quiet as possible. Do not try to make some town or some barn, but stop where you are and if necessary blanket the horse, but above all keep him quiet.

Horses that are lightly exercised and then rested for thirty minutes before going to work after a short period of idleness, do not get azoturia. This light exercise stimulates the circulation and thus no clogging of the blood vessels occurs and the azoturia is prevented. Horses in which the grain ration is very much reduced during the idle period and whose bowels and kidneys are kept working free from being fed properly, very seldom contract this disease. Horses that have been idle for some little time, if they do get this will have a much lighter attack than those horses that have only been idle for a day or so. Mares do not have the disease as severely as do geldings and the percentage of recoveries is much larger in them than it is in the geldings.

When the animal is known to be susceptible to this condition or when it shows by its actons that somethng is wrong, especially if it has been idle for a day or so, and if it has been feeling exceptionally good for the first few minutes after starting to work, then suspect azoturia and stop the animal at once and keep it just as quiet as possible. Send for a veterinarian as once in a while a case that looks very mild may seem to be getting along very rapidly and at all at once take a relapse and go down. Do not take any chances, as they are sometimes the cause of the loss of a valuable animal.

If you have an animal that is susceptible to these attacks cut down the grain ration one-half or more when the animal will be idle for a day or so, and then give some exercise every day. If perchance a day or two must be missed, before using again, exercise for a few minutes and then place in the barn and let the animal rest for a half hour. Keep the bowels free by the use of oil meal or bran.

There is no treatment that is specific and the proper care and attention that should be given by the owner early in the attack and then the care through the attack will many times contribute more to the recovery than anything that could be done.

G. H. CONN.

BARN-YARD MANURE VERSUS COMMERCIAL FERTILIZER.

In this article, we will not conider Fertilizers at present prices but as they were before the war, and as we hope they shall be when peace is restored. Does it pay to use Commercial Fertilizer? Yes, if we study and use it intelligently. But it does not pay to use it and let our Barn-yard manure go to waste. Some Farmers use the manure only after it has lost 50 per cent of its plant food, first a large part of the liquid which contains 2-3 of the plant-food drains through the stable-floors and is lost. Then the solids are thrown out by the barn where if left for 5 months will lose 50 per cent. Store it as we may it will los from 50 per cent to 50 per cent of its value, according to the manner of storage.

Where stored by the barn we may notice on some fine spring morning the nitrogen going up from it like smoke, and after a rain we notice a little brown stream trickling towards the Creek carrying with it the phosphoric acid and potash.

To make this more apparent let us assume that a man has ten cows and eight horses. The manure from these is allowed to accumulate for six months in heaps, and to stand on the average for 8 months. In 6 months ten cows would make about sixty five tons of manure and 3 horses about thirteen tons being altogether about seventy-eight tons which is worth about $200. If this manure has been kept as above it will depreciate to $100 i. e. a loss of $100.

And then to make matters worse

NOTICE

The attention of owners of stallions is drawn to "An Act to Provide for the Inspection and Registration of Stallions," 5th George V., Cap. 18, and 6th George V., Cap. 44, under which all stallions travelled or offered for service must be enrolled at the Department of Agriculture on or before the 1st day of May, 1917.

Inspectors will be appointed by the Department, to report on each animal before a certificate is issued. Evidence of breeding and ownership must be submitted and a fee of $2.00 forwarded with application.

Further information can be obtained by applying to

Department of Agriculture
Fredericton, N. B.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

THE LAWRENCE-WILLIAMS COMPANY, Toronto, Ont.

the man who carelessly allows $100 worth of manure to escape into the air and the brooks, probably buys $40.00 or $50 worth of Commercial Fertilizers an amount of money which he could have kept for other purposes, had he more carefully conserved this manure.

Let us look for a moment at the value of manure from different farm animals.

One ton of Manure contains about

	Nit.	Phos. Acid	Potash	value about per ton
Hens	30	25	17	$8.35
Hogs	16	8	6	4.00
Sheep	15½	7	11	4.20
Horses	10	5	9	2.75
Calves	10	.3	11	2.75
Cows	8½	5	8	2.40

One ton of average barn-yard manure is worth about $2.97 that is one ton of well preserved barn-yard manure contains as much Nitrogen, Phosphoric Acid and Potash as would cost $2.97 to buy in chemical form.

There are other home fertilizers that go to waste such as wood-ashes which contain up to 5 per cent potash and which are often thrown out and left to leach away. Then there is the fish offal, of which along the shore, hundreds of tons are thrown into the sea annually and yet this refuse is worth from $20 to $40 a ton as a fertilizer.

Then we have large peat bogs. Prof. Bottomley of London, states that the application of 600 lbs bacterized peat to the acre would double the crop of wheat just how or with what he bacterizes peat we do not know but we hope to get the information in the near future.

Again we have green crops to plough under and this is the slowest but perhaps the cheapest way to fertilize our oil.

If we must use commercial fertilizer, by all means let us use the chemicals only. We object to use ready mired Commercial Fertilizer. First on account of having to pay the freight on what they call "filler" secondly on account of having to pay about $8.00 a ton for mixing which we could do for much less money if we have the material to mix. We dont even have to mix the chemicals if we sow by hand, but can sow each separately. Thirdly, because no company mixes the fertilizer to suit all soils as different soils require dfferent amounts of varous kinds of plant-food. For instance, some soils need large applications of potash while such would be injurious to other soils such as heavy clay loam. Now let us study our soils and get the chemicals and mix them to suit.

Let us assume that we purchase
Nitrate of Soda 400 lbs.
Acid Phosphate 1200 lbs.
Muriate of Potash 400 lbs.

Making 1 ton carrying 3; 9½; 16; costing us about $29.00 in per war times.

We would pay our Local Agent $42.00 for a ton of ready mired fertilizers carrying the same amount of plant-food or if we would use a lower grade say 1½; 5; 5 (of which there is more used than the higher grades) then we must take 2 tons to supply the same amount of plant-food which could cost about $51.00.

This shows plainly why we should use the chemicals only.

Today we hear it preached Lime, Lime and more Lime. An application of 1 to 4 tons per acre is all right once in a life-time, but "a continuous living year after year without manure will make; both farm and farmer poor". Or "it may enrich the eatter and beggar the son." Let us rather than force nature to give up more than she sees fit, help her by supplying in some form each year a little more plant food than our crops take from the soil. We will then not be soil robbers and when we leave our farms they will be in a better state of fertility than when we took charge of them.

Paper read by A. W. Dauphinee, before the Annual meeting of the Lunenburg County Farmer's Association.

"Walter would rather stay home and milk than go away on a picnic!"

HOW to get along with less hired help, and yet escape the drudgery that drives boys away from the dairy farm—this is the problem that is being solved by the

EMPIRE Mechanical Milker

No one seems to like hand milking, yet every boy loves to run a machine. Here is a typical example of how it works out:

AMHERST, N.S., Jan 5, 1917

Dear Sirs:—
Walter, who was 16 years old, loves a machine, but hated to milk cows, so we bought the Empire Milking Machine that was shown at the Winter Fair at Amherst in 1916. It has given good satisfaction in every way.

We have milked at the rate of 40 cows an hour, but think it best not to exceed 32 as that leaves very little stripping to do.

One cow that only gave 21 quarts the year before, gave 29 quarts with the machine; two others that gave 22½ quarts the year before gave 26 to 28 quarts this year when machine milked. We have just one cow that refuses to give her milk down with the machine. The cows are very much quieter when machine milked and sore teats are all done away with. Walter has taken full charge of engine and milker since it was put in and has never missed a milking—would rather stay home and milk than go away on a picnic. GEO. E. FREEMAN

While overcoming the strongest objection to the life of the dairy farmer, the Empire Mechanical Milker is helping hundreds to make more money. Why shouldn't YOU be one of them? Write for Illustrated Booklet and full particulars to Dept. L

KEEP YOUR HORSES IN PRIME WORKING CONDITION

SOUND legs pull big loads. No horse with a Spavin, Splint, Curb, Ringbone, Bony Growth or Sprain, can do itself justice. Thousands of horsemen have been keeping their horses sound by using Kendall's Spavin Cure—the old reliable, safe remedy. Mr. Maurice Wayville, Amherstburg, Ont., wrote on April 20th last—"I cured a jack spavin with two bottles of your Spavin Cure. I am just taking off a bog spavin. It is the best liniment for sprains you can get for man or beast. I would like to have a copy of your "Treatise on the Horse".

KENDALL'S SPAVIN CURE

acts quickly, leaves no scars or blemishes, and costs little—$1. a bottle—6 for $5. Get our valuable book—"Treatise on the horse"—free at your druggist's, or write us 111

Dr. B. J. KENDALL CO., ENOSBURG FALLS, VERMONT, U.S.A.

OMAZON CANADIAN FOOD

OMAZON

is the great producer of vigorous stock, is a Canadian Food and a medicine excellent for horse, pig and poultry. It gives endurance, increases appetite and gives vigor.

As a blood purifer and for increasing the quantiiy of milk in mare and cow it is highly recommeded. It is economical. It saves grain. Mixed with other food it makes a big saving in feed expenses.

Ask your merchant for these preparations

Watch the improvement in your stocks. Write us for circulars.

INSTEAD OF PAINT

DON'T paint your pretty home this season, but use instead Velvex Creosote Shingle Stains. By so doing, you can bring out all the beauty of the wood. And think of the preservative value. Velvex Shingle Stains contain Creosote, the greatest wood preservative known. This means prolonged protection against wind and weather. It therefore means *economy.*

Velvex
Creosote Shingle Stains

Half the Cost — Twice the Wear

Velvex Creosote Shingle Stains cost about half as much as paint. And they wear much better because they penetrate the wood. They do not evaporate or dry out and of course they cannot peel off. These stains come in any color you want. They are very easily applied. You ought to investigate them. We have the complete line and we know you will like them.

Write us for a sample of wood stained with Velvex Creosote Shingle Stain.

POULTRY.

NEED OF A CHICKEN HOUSE

There is no question that every person who raises chickens should have a building to house them in.

The proper size of the henhouse will depend on the number of fowls it is designed to shelter, and the excellence of the ventilation. Some experienced poultry writers have asserted that two and one-half feet floor space is sufficient for each bird, but I think that three feet is little enough. Three feet floor space for 100 chickens would require a building about 10x32 ft.

In whatever style it is built, two things are absolutely essential, and without which success with poultry cannot be expected. The building must be windproof and waterproof. The walls must be tight enough to keep out the rain. To expose hens to a draft of cold air blowing through cracks, is determental to their health, and sure to bring on sickness.

Fowls, the same as human beings, must have pure, fresh air to breathe, or they will become consumptive and die. There is no perfect system of ventilation that I know of; they are all constructed on the principle of letting in fresh air at the bottom, and causing the vitiated air (which is lighter) to pass up through a ventilator in the roof.

Our poultry house is 10x16 ft., and 8 ft. high to the plates, with a ridge roof, and accomodates 50 fowls. If I were to build another to house 100 fowls, I would make it 10x32 ft. and 8 ft. high to the plates, with a ridge roof, which looks better than a shed roof, makes more air space, and costs but little more.

The plates in the middle would require a cross girt to prevent spreading. I would use rough hemlock boards (which are cheaper than pine) nailed vertically to the sills and plates, and the cracks battened on the outside with hemlock battens 2 in. wide and 1 in. thick. Hemlock roofing lath on the rafters and two courses of hemlock boards for the roof—the upper course covering the cracks of the lower. On the southeast side, the roof should project two and a half feet beyond the plate, in order to cover the nest boxes (which should be on the outside) from rain and snow—the next boxes to extend across that side, securely covered with hinged lids, one for each nest. This enables the eggs to be gathered from the outside, without disturbing the hen that may be laying in the next box. On the inside, there is a shelf for the hens to walk on, and an opening for entrance to each nest. Hens loves privacy when they can get it, and this arrangement by which each nest is hidden from the others, gives them the privacy they want, and by furnishing plenty of nests, prevents in a great measure several hens laying in the same nest. Another advantage, by sliding a stopper over the inside opening, a sitting hen can be protected from intruders that want to occupy the same nest, either as layers or sitters. By propping up the nest lids on the outside of the house, the sitting hen can come off to get feed and water.

The floor is of hemlock boards, planed, in order that they can be more easily swept every day. Dry earth and road dust are kept for scattering under the perches, and swept out every day with the droppings and put into a box under cover for manuring the garden. The perches are all of the same height, so that there may be no quarrelling about the "highest seats in the synagogue." The perches are not nailed fast, so that they can be taken down and scrubbed with lime water. There is a hen ladder for the big clumsy hens to get to the percher without flying. There is a slatted cupola in the peak of the roof for ventilation. There are two 12-light windows, one in each gable end.

CHOLERA

This disease is contagious and is caused by microbes. It arises from unsanitary conditions, such as contaminated food and water served in dirty dishes, and from the droppings of sick fowls. Lowered vitally is another cause. Two of its symptoms are thirst, and yellow and greenish droppings. When going about among the fowls, an occasional glance at the droppings will quickly detect the presence of cholera.

Moping birds with pale or dark combs and ruffled feathers should be immediately placed in a separate coop, where they cannot run with the rest of the fowls. Whitewash and disinfectants should be freely used in this hen hospital. All infected droppings and dead birds should be burned, or buried in some place where the other fowls never go. Burning is best. Fowls affected with cholera die in a day or two. If possible, the fowls in the coop where the disease first makes its appearance should be shut off from the rest of the flock until all evidence of the disease has passed. Preventivie methods are everything, as after the disease develops, medical treatment is generally a failure. I have known cholera to run through a coop of 35 hens, killing nearly all.

In this connection, it is well to state that too many hens should not be kept in one coop. It is much safer to divide the flock into sections. Cleanliness is one of the essentials in raising poultry. Plenty of fresh water, grit, clean food, and roomy, well-ventilated houses will do much to ward off disease. If you have lost many fowls in the past, just pause a moment, in your busy rounds of duty, and ask yourself whether or not you have given careful attention to such rules as are outlined in this article. Experience is our best teacher.

TIPS IN TURKEY BEARING THAT WILL MAKE THEM GROW

The turkey business has been seriously injured by the prevalence of blackhead in many flocks. The technical name of this disease is "infectious entero-hepatitis," and that means inflammation of the intestines and liver, caused by a micro-organism.

Blackhead most frequently occurs in birds from one to four months of age and it sometimes wipes out entire flocks. The symptoms are drooping wings, ruffled feathers, diarrhea and sometimes the head turns purplish before death. On performing a post mortem, if yellow green spots are found on the liver it is practically sure that the disease is blackhead.

Blackhead is a very contagious disease and infected birds should be destroyed and the healthy members of the flock removed to an isolated place while the former runs are disinfected with a five per cent. solution of carbolic acid. Feeding sour milk to turkeys is excellent in keeping down the ravages of the disease.

In raising turkeys inbreeding must be avoided. In purchasing parent stock it is well to select birds from different parts of the state in order to be sure and obtain unrelated birds. The rise in turkey raising is so great that the most vigorous breeders are none too good.

Turkeys require plenty of fresh air, and they will not stand as much confinement as hens. If the roosting poles are placed in open front sheds the birds will do very well, as they need no protection except from winids and dampness.

Many turkey raisers feed the birds nothing through the summer season when insects are plentiful on the range. A long string of turkeys strutting through an orchard gathering bugs is a sight worth watching and the value of turkeys on large fruit farms cannot be overestimated. A large orchard possibly surrounded by clover fields and woods will insure a turkey flock with an abundance of food and seven or eight months of the year they will manufacture turkey meat without cost to their owner.

The turkey hen will select her own nest in a slightly protected spot on the range and sometimes in stormy weather it pays to place a small A-shaped coop over the nest. If the nest is in a fairly safe location possibly a coop would only attract prowling animals at night and the hen would be more sure of a good hatch if left entirely to herself. In either case raising turkeys is something of a gamble. Science seems to have made small progress in solving the living problems of young turkeys.

MATURE THE PULLETS TO GET EARLY LAYERS

The eggs that are laid during the moulting season are mostly laid by the early matured pullets. A large source of profit in the poultry business consists in hatchiing early chicks and rushing their development to an early maturity. In order to accomplish this, much attention must be given to their feeding. They should have a well-balanced ration, lagely protein in nature, and plenty of it.

Early rapid growth is obtained from muscle building protein feeds. Where the chickens are allowed to run over a large range they will get a good many worms and bugs that will prove to be a great aid. However, they must not be made to run their legs off chasing after this kind of feed as it may retard their development. If flock is large, range feeding alone is apt to produce very poor results for the reason that the older chickens will get most of the worms and bugs and little will be left for the younger. Part of their protein feeds should be given to them and they should be encouraged to eat.

Chickens grown in conjunction with the dairy should have access to unlimited quantities of milk. Nothing can be better for them, even after they are full grown hens. We give them penty of milk, both winter and summer. Meat scraps should also be placed before them freely, although this is not so essential where there is plenty of milk. Very little fat producing grains should be given; it had better be saved for some other purpose . Growing pullets should have plenty of exercise to make a normal,

Severe Headaches and Pains in the Back

Resulted From Deranged Kidneys and Constipation of the Bowels.

It is in vain to try to regulate and restore the healthful action of the kidneys until the liver and bowels are set right.

And just here is where so many kidney medicines fail. Kidney derangements almost invariably begin with constipation and torpidity of the liver. The whole work of filtering the blood is thrown on the kidneys, and in time they fail to stand the strain. The poison in the system gives rise to severe headaches, pains in the back and tired, depressed feelings.

Because they act directly on the liver and bowels, as well as on the kidneys, Dr. Chase's Kidney-Liver Pills are eminently successful in the treatment of kidney derangements.

Mr. William Loney, Marysville, N.B., writes:—"I am glad to recommend Dr. Chase's Kidney-Liver Pills to anybody who is suffering from kidney trouble or constipation. I suffered for a long time from kidney disease and pains in the back, but have found that by using one pill a week the kidneys and bowels are kept in good order, and I do not have any more pains in the back or head like I used to have. I was also a great sufferer from piles, and could get no relief until I used Dr. Chase's Ointment. This ailment is entirely cured now, but we always keep both the pills and the ointment in the house for use when they are needed."

This statement is endorsed by Mr. F. Saunders, Town Marshal, who writes that Mr. Loney's letter is true and correct.

Dr. Chase's Kidney-Liver Pills, one pill a dose, 25 cents a box, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

Remember that imitations only disappoint. The genuine bear the portrait and signature of A. W. Chase M.D., the famous Receipt Book author.

WAS WEAK and RUN DOWN

SUFFERED WITH "NERVES."

Many women become run down and worn out by their household cares and duties never ending, and sooner or later find themselves with shattered nerves and weak hearts.

When the heart becomes weak and the nerves unstrung it is impossible for a woman to look after her household or social duties.

On the first sign of any weakness of either the heart or nerves, take Milburn's Heart and Nerve Pills, and you will find that in a very short time you will become strong and well again.

Mrs. J. A. Williams, Tillsonburg, Ont., writes: "I cannot speak too highly of Milburn's Heart and Nerve Pills. I suffered greatly with my nerves. I was so weak and run down, I could not stand the least excitement of any kind. I believe your Heart and Nerve Pills to be a valuable remedy for all sufferers from nervous trouble."

Milburn's Heart and Nerve Pills are 50c. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

healthy and rapid growth, but they will get this on the range no matter how much feed you place before them because it is their nature to hunt and scratch for worms and chase bugs. During the winter when they must neccessarily be kept shut in it will be necessary to provide an incentive to exercise, but until that time give them plenty of feed and they will provide their own exercise.

The important thing is to produce quick-maturing pullets early in spring and keep them growing steadily so that when laying time comes they will be sufficiently matured to begin laying and producing results. Then is the time of year when eggs are scarce and every pullet that lays will bring in big returns.

P. H. EATON.

COST OF RAISING LEGHORN PULLETS

SUMMARY.

1. Based on four seasons' work and several thousand chicks hatched, it required 1.83 eggs set, for every Leghorn chick hatched.

2. The cost of hatching these eggs was $.021 per chick, which when added to the cost of eggs increased the total cost of a chick when hatched to $.057.

3. Based on the first twelve weeks of life, it took 5.69 pounds of grain and mash and 5.07 pounds of milk, costing $.1434 to feed a Leghorn chick.

4. During the same time, it took 3.59 pounds of grain and mash and 3.41 pounds of milk, costing $.084, to produce one pound of gain.

5. When figuring cost of feed, fuel, labor and litter, the whole cost of one pound of gain was $.154.

6. The average Leghorn pullet twenty-four weeks old and ready to lay, weighed 2.75 pounds.

7. The feed was by far the most expensive item in the cost of rearing chicks.

8. On the basis of 100 chicks hatched and a 17 per cent. mortality, the per cent. pullets and the per cent cockerels were 40.1 and 42.9 respectively.

9. The time of hatching greatly influenced the rate of growth of chicks, price of broilers, net cost of growing and weight of pullets at laying age. Early hatching paid best.

10. Early cockerels were sold at a profit. May-hatched broilers sold at a loss.

11. The gross average cost of a pullet was $.434. This, less profits in cockerels, made the net cost $.381.

12. Mortality varied and influenced the final cost. The average mortality of 999 chicks was 17 per cent.

13. For every pullet reared it required the setting of 4.57 eggs.

14. Cockerels grew more rapidly than pullets.

A. G. Phillips, Purdue University, Ind.

Castor oil is a good remedy for the stunted chicks and it should be given in capsules. Pouring a spoonful of oil down the bird's throat may cause it to strangle.

The use of lice paint continually in the poultry houses is a good preventative measure. To reduce expenses one-half, kerosene can be mixed with the lice paint. The paint gets in the feathers when the birds are on the roosts and it assists in preventing feather eating.

When canker is chronic it goes through the system of a bird and the bird must be killed. Continual running at the nose may be a sign of canker and it does not pay to keep a bird that may contaminate others Sparrows may carry chicken pox from one farm to another. Apoplexy comes from overfeeding and lack of exercise. Never doctor a chicken that is not sick and it is not necessary to use permanganate of potash in the drinking water if there are no colds in the flock.

RATIONS FOR HENS.

Feeders of horses, cattle, sheep and hogs have claimed for years that these animals must be fed a "balanced ration." Special attention has been given to balanced ratios for dairy cows. By this is meant that one food constituent should not be fed in excess, while another is lacking for the upkeep of the animal's body. The protein must be in a certain proportion to the sugars, starches and fat in the food. Now the hen comes in for her share in this scientific feeding.

Ten times as many eggs were produced by hens fed a well-balanced ration as by those given only corn, wheat and oats in an experiment conducted by the Ohio Station. The balanced ration consisted of three parts by weight of corn and one part of wheat fed twice daily in the litter, and a mash mixture of two parts meat scrap added to two parts ground corn and one part bran fed in self-feeding hoppers. The hens given the balanced ration ate more feed, which cost about 50 per cent. more than the ration of corn, wheat and oats. However, they gained more in weight and produced ten times as many eggs, making a net profit while the other lot was kept at a loss. The test period lasted for 140 days.

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Address

THE RECKONING

By Theodore Roberts.

Ye who reckon with England—
Ye who sweep the seas
Of the flag that Rodney nailed aloft
And Nelson flung to the breeze
Count well your ships and your men,
Count well your horse and your guns
For they who reckon with England
Must reckon with England's sons.

Ye who would challenge England—
Ye who would break the might
Of the little isle in the foggy sea
And the lion-heart in the fight—
Count well your horse and your swords
Weigh well your valour and guns,
For they who would ride against England
Must sabre her million sons.

Ye who would roll to warfare
Your hordes of peasants and slaves,
To crush the pride of an empire
And sink her fame in the waves—
Test well your blood and your mettle,
Count well your troops and your guns,
For they who battle with England
Must war with a Mother's sons.

THE INFLUENCE OF MEN ON THE BOYS OF A COMMUNITY.

"Honor and Shame from no condition rise Act well your part there all the honor lies."

A few weeks ago while calling at the home of a friend I noticed on her mantle the small statue of a boy, his cap tilted rakishily on one side of his head, a pipe in his mouth and wearing a pair of long boots many sizes too large for him. The whole attitude of the figure was one of careless dare-devil-try. On the base of the statue were the words "Just Like Father." While it amused me it gave me food for thought. Every boy I think wants to be "just like father"—or if not at least like the older brother or perhaps some man in the community whom he takes as his ideal. Those who have studied boy nature understand that he hates to be thought a molly-coddle or show any feminine weaknesses whatever, but instead he wants to be a sailor like Uncle Jack or a soldier like Billy Smith or perhaps a horse-jockey like Jake Turner.

Fathers are important factors in the training of boys; with many apologies to big brother Man I venture to assert that the average mother can manage a boy better the father can; but the ideal condition only exists when the father and mother work together. The father ought to be the boys best chum.

In training colts the one who has learned to hold the rein loosely enough to allow perfect freedom, but keeping a firm grasp upon them should they become restive is a good driver. So with boys, the father who can guide without driving who can be indulgent and yet firm are rewarded for their efforts by seeing their boys grow up to be upright honest men. Boys are not always to blame for their wildness and stubborness. They are like young colts that have been spoiled in their training and have developed curious habits. Responsibility for much of the moral depravity that exists among boys lies first at the door of fathers and second at the door of the young men of the community. Training children has gone out of fashion to some extent. The farmers of the country spend more time and thought and anxiety over the training of their colts than their children. Surely this ought not to be.

Fathers, when you have provided food and clothing for your children do you think that this is enough? You have by no means fulfilled your duty. If they are not willing to spend their evenings at home you may rest assured that something is lacking and that in some way you are responsible. A little expenditure of time and money in providing attractive quarters for the boys brings in large returns in the years to come. There seems to be a mistaken idea that boys do not care for nice things. Boys like pleasant rooms as well as their sister only it must be planned on different lines. There let them entertain their friend and in this way you may weed out the undesirable companions for your boys, whom they will not meet unless they are sent out into the "highbys and byways" to seek companionship.

I once heard a young girl say "Boys from the age of 18 should be kept in a barrel and fed through the bunghole. They are simply intolerable. Big blundering things." She was of course young too and intolerant. We cannot deny that the period in a boys life that the girl deplored tries the patience sorely, but those who have his best interest at heart, feel that these are the years when he needs the greatest care and the most study. The influence of his companions at this time may make or mar his whole life. These are the most critical years. The impressions made at this time are never effaced. It is then that the germs of vice or virture are sown; that feelings and sentiments are developed which affect materially the character of the future MAN. His associates (the men of the community) are the ones who turn the scales for good or ill.

This is the awkard age for the growing boy and he feels it more than we grown ups understand. His big brother says: "Why dont you take the stair-case with you?" when he stumbles going up stairs, or; "Why don't you sit on your hands to keep them out of the way?" he asks brutally when he sees the blundering fellow trying to appear at ease. Surely a society for squelching the older brother should be organized in some households. Remember our boys are the hope of the nation and the older men of the community should help them to "make good"...they are shaping the characters and inclining towards either good or evil the future citizens of their country.

The life stories of Washington of James Watt and Sir Issaac Newton all go to show the influence of good companionship at this stage of development in the boy's life. We do not consider the great influence that invironment has, as much as we should. Young men who have gone a little farther in life's journey, you have many reasons to be temperate pure and manly; for there are many boys who are copying you. The old Scotch saying "A childs among ye takin' notes and faith he'll print it" is often truer than we realize, and many a so-called "bad boy" is merely "printing" notes that he has taken from an older person....someone he has idealized.

Longfellow writes:

"No action whether foul or fair
Is ever done but it leaves somewhere
A record written, by fingers ghastly
As a blessing or a curse ond mostly
In the greater weakness or greater strength
Of the acts which follow it."

And certain it is that our influence "rolls from soul to soul and grows for ever." Like a stone thrown into a clear pool of water causing circles to ever widen from it, our influence in the clear conscience of young children will remain for ages.

Among the blackest blots on the life of any community is the evil of intemperance. It kills kindness, and sympathy, making the victim an easy prey to all manner of vicinousness. I have known young men who have not only taken the downward step themselves but have also and much worse induced the boys of the neighborhood to take their first glass. Young men do YOU realize what you are doing? "Far better that a mill stone were hanged about your neck and that you were cast into the sea than that you caused one of these little ones to offend."

All over the civilized world men have formed themselves into "catch my pal societies" and "Big Brother, clubs that they might keep the young men from this and other blighting temptations. Am I my brothers keeper," you ask. Certainly you are and when you are able to say with St. Paul "If meat make my brother to offend then will I eat no more meat, while the world endureth" we will not be noble men nor true patriots.

Then young men why not prohibit the sale of liquor? If young boys are reared in a community where the men work unitedly for the cause of temperance and vote for men who will demand temperance legislation they will come to know its dire effects and the end of the liquor traffic will be nearer than we think.

The men must take an interest in the schools of the district where their sons and daughters spend the greater part of their time. The school house and grounds is often the guage of the districts moral standing. Teach boys to love out door and manly sports and see that the facilities of the school encourage these. Be interested in their base ball games and all their interests in physical and mental well being. The swimming hole at the willow shaded bend of ye river has been the scene of more real enjoyment than a whole city could afford.

In cities mean work and give of their means to establish gymnasiums' but in the country we do not need to do this. Nature has provided better gymnasiums than man ever conceived. Then by all means instill into the minds of the boys a love for clean manly sports. It will temper their nerves' develop their muscles and breed in them courage and resourcefulness as well as a keen appreciation for all beautiful out-of-doors life where "God keeps open house." Such a boy cannot help but be pure minded sypathetic, and a lover of the beautiful as well as healthy and eneggetic.

Life is very short at best. We live it only once. Let us get the greatest possible enjoyment from it. What will it avail us if we spend every moment of the best of our lives in a mad scramble for the "almighty dollar". Yes certainly we must live and to live we must work....but I think that many fathers....and men in a community are giving boys the wrong impression of the worth of a dollar. Even in homes every pleasure, or thought must come after that most important one....to get money and more money....to never let a cent slip away. It is well and necessary to teach children thrift and economy, but it is horribly wrong and we are doing our children a great injustice to allow them to grow up thinking that the earning and amassing of money is the chief aim in life. That is not the ideal we should hold before them.

Manners have been called "minor morals" While it may be true that manners may be entirely dissociated with morals it is also true that the connection between manners and morals is close enough to warrant the definition given. It is well worth while for the father to pay attention to the child's manners. The earlier it is begun the better for it then becomes a habit of life that is not easily shaken off. Boys are easily influnced in this way by the elders of a community. If they are boorish and rough the boy will think it manly to be so and immediately copy the manners.

I have not touched upon smoking

GILLETT'S LYE

HAS NO EQUAL

It not only softens the water but doubles the cleansing power of soap, and makes everything sanitary and wholesome.

REFUSE SUBSTITUTES.

HELP FOR WORKING WOMEN

Some Have to Keep on Until They Almost Drop. How Mrs. Conley Got Help.

Here is a letter from a woman who had to work, but was too weak and suffered too much to continue. How she regained health:—

Frankfort, Ky.—"I suffered so much with female weakness that I could not do my own work, had to hire it done. I heard so much about Lydia E. Pinkham's Vegetable Compound that I tried it. I took three bottles and I found it to be all you claim. Now I feel as well as ever I did and am able to do all my own work again. I recommend it to any woman suffering from female weakness. You may publish my letter if you wish."—Mrs. JAMES CONLEY, 516 St. Clair St., Frankfort, Ky.

No woman suffering from any form of female troubles should lose hope until she has given Lydia E. Pinkham's Vegetable Compound a fair trial.

This famous remedy, the medicinal ingredients of which are derived from native roots and herbs, has for forty years proved to be a most valuable tonic and invigorator of the female organism.

All women are invited to write to the Lydia E. Pinkham Medicine Co., Lynn, Mass., for special advice,—it will be confidential.

Minard's Liniment Co., Ltd.

Gents,—I have used your Minard's Liniment in my family and also in my stables for years and consider it the best medicine obtainable.

Yours truly,
ALFRED ROCHAV,
Proprietor Roxton Pond Hotel and Livery Stables.

especially the fatal cigarettes, using bad language and many other vices which so-called gentlemen practise, but be it said in all earnestness that there never was a time when in the history of young Canada there was a greater need for young men with the hall mark of manhood upon them or when the opportunities for young man were greater than they are to-day.

By your example young men teach the coming generation what it means to be a true citizen of one of the greatest nations on earth....and that there are better and higher things than mere selfish pleasures.

"He who serves his country best
Who lives a pure life and does righeous deeds
And walks straight paths, however others stray,
And leaves his sons—as uttermost bequest,
A stainless record which all man may read.
This is the better way
No drop but serves the slowly lifting tide,
No dew but has an errand to some flower;
No smallest star but sheds some helpful ray,
And man by man each aiding all the rest
Make the firm bulwark of the nations power
There is no better way.

TESTED RECIPES, FOR DESSERTS.

Good cookery means the knowledge of all fruits, herbs, balms, and spices, and all that is healing and sweet in fields and groves and savory in meats. It means carefulness, inventiveness, watchfulness, willingness, and readiness of appliance. It means the economy of your great grandmothers and the science of modern chemists. It means much tasting and no wasting. It means English thoroughness, French art, and Arabian hospitality. It means, in fine, that you are to be perfectly and always ladies (loaf-givers.) —uskin.

Vinegar Pudding.

2 cups flour — 4 tbsp sugar
3 tsp cream of tartar — 4 tbsp butter
1½ tsp soda — 1 egg
milk.

Sift dry ingredients together several times, add milk and egg. Cut dough in strips and place in sauce. Bake.

Sauce.

½ cup molasses
1 table spoon butter
1½ cup hot water
½ cup sugar
nutmeg
2 table spoon strong vinegar

Banana Shortcake.

1-3 cup butter
1 cup sugar
2 eggs
½ cup milk
2½ teaspoon Baking powder
3 bananas
cream filling
merfngue
1¾ cup flour.

Mix in the same manner as cake. Bake in sheet. When baked cover with custard, then place bananas on top cut in half lengthwise. Cover bananas with meringue and brown.

English Cream Custard For Banana Shortcake.

1 pint milk — ½ cup sugar
1 egg or 2 yolks — ½ tsp vanilla
¼ tsp salt — 4 tbsp flour

Mix flour with part of sugar, moisten with milk then stir into hot milk, cook 15 minutes. Beat egg, add remaining sugar and salt. Stir hot mixture into this. Cook a moment longer. Strain, cool and flavor.

Fig Pudding.

2 cup bread crumbs
1½ tsp B. P.
salt
½ tsp cinnamon
½ tsp nutmeg
1 cup brown sugar
2-3 cup finely chopped suet
1-3 lb figs cut fine
2-3 cup milk
2 eggs.

Mix in the order given. Steam about 2 hours. Serve with hard sauce.

Hard Sauce.

1-3 cup butter
1 table spoon rich milk
1 cup powdered sugar
½ teaspoon vanilla

Cream butter add sugar gradually, then milk and flavoring.

Coffee Tapioca

¼ cup tapioca — 2 cup coffee infusion
4 tablespoon sugar.

Soak tapioca one hour. Cook in coffee infusion, when partially cooked add sugar. Chill. Serve with cream or custard sauce.

Maple Nut Pudding.

Stir together 1½ cup brown sugar, 6 tablespoon flour, ½ cup cold water. Add 2 cups boiling water and boil 10 minutes. Remove from fire and stir in the stiffly whites of two eggs. Add ½ cup chopped walnuts. Turn into mould, serve with cream.

Lemon Snow.

1½ cup water
2-3 cup sugar
thin shaving lemon rind
6 tablespoon flour
1-5 cup cold water
1-6 cup lemon juice
2 egg whites.

Make syrup of water, sugar and lemon rind. Cook 3 minutes. Remove rind. Mix flour with cold water, add to syrup and cook until there is

WHOOPING COUGH

The Infant's Most Dangerous Disease.

Whooping Cough, although specially a disease of childhood, is by no means confined to that period but may occur at any time of life. It is one of the most dangerous diseases of infancy, and yearly causes more deaths than scarlet fever, typhoid or diphtheria, and is more common in female than in male children.

Whooping Cough starts with sneezing, watering of the eyes, irritation of the throat, feverishness and cough. The coughing attacks occur frequently but are generally more severe at night.

On the first sign of a "whoop," Dr. Wood's Norway Pine Syrup should be administered, and weeks of suffering prevented, as it helps to clear the bronchial tubes of the collected mucous and phlegm.

Mrs. Nellie Barley, Amherst, N.S., writes: "I have much pleasure in saying that there is no cough syrup like Dr. Wood's Norway Pine Syrup. My little girl took whooping cough from a little girl who has since died with it. I tried lots of things but found 'Dr. Wood's' to give the greatest relief. It helped her to raise the phlegm, and she is now better.

My young brother is also taking the cough, and I am getting 'Dr. Wood's' to work again."

Dr. Wood's Norway Pine Syrup is put up in a yellow wrapper: 3 pine trees the trade-mark; price 25c. and 50c. Refuse substitutes.

Manufactured only by THE T. MILBURN CO., LIMITED, Toronto, Ont.

no taste of raw starch, remove from fire add lemon juice, fold in egg whites, mould and chill. Serve with lemon custard sauce.

Lemon Custard Sauce.

1 cup milk 2 tablespoon sugar
yolk 1 egg salt
thin shaving lemon rind.

Scald milk and lemon rind, add beaten egg mixed with sugar. Cook until it thickens. Strain, cool, flavor.

QUEENS PUDDING.

1 cup cake cut in cubes
1 pt. milk
½ cup sugar
2 eggs
1 teaspoon vanilla
jelly or jam

Mix milk, sugar and egg as for custard, pour over cake which has been placed in buttered baking dish. Bake in moderate oven until slightly brown. Make meringue of whites of eggs, spread over pudding a layer of jam, then meringue and brown in oven. Serve cold.

SYRUPS, FRUITS AND VEGETABLES

Thin Syrup

One and one-half quarts of sugar and one quart of water. Heat to the boiling point. This may be used for apples, peaches and pears or with any sweet fruit, and with those to which more sugar will be added in preparation for the table.

Medium Thin Syrup

Mix 1½ quarts of sugar and one quart of water and boil two to three minutes or until solution begins to be syrupy. This gives a density suitable for high-grade fruits for table sauce.

Medium Thick Syrup

Mix 1½ quarts of sugar and one quart of water and boil six to eight minutes or until it piles up on the edge of a spoon when poured from it. This gives a syrup of concentration suitable for strawberries and other fruits, where a thick syrup is desired.

Thick Syrup

Mix 1½ quarts of sugar and one quart of water and cook eight to 12 minutes or until it forms a very soft ball. This gives a syrup of great density and may be used for preserves.

Windfall Apples—Sliced

Peel, core and slice apples. Scald in boiling water for two minutes. Plunge into cold water. Pack in glass cans and add one cup of hot thin syrup or boiling water to each quart, adjust rubber and top on glass and partially seal. Sterilize 16 minutes in hot-water bath. Remove jars, tighten covers and invert to cool.

Berries, Cherries, etc

Can fresh, sound berries the same day that they are picked. Remove hulls or stems if any. Place in strainer or colander and pour cold water over them to cleanse. Pack closely in jars without crushing. Pour hot syrup over to fill jar. Place rubber and top on glass jar and partially seal. Sterilize 15 minutes in hot-water bath.

Peaches

Grade for size, ripeness and quality. They should be graded carefully, and only those that are just beginning to soften should be used. They may be peeled with a knife if there is but a small quantity of peaches to be canned Or, scald peaches one minute in boiling water. Plunge into cold water. Remove skin. Halve, pit and pack in glass jars. Fill with hot syrup. Adjust rubber and top and partially seal. Sterilize 15 minutes in hot-water bath.

Strawberries

Can fresh, sound strawberries on the same day that they are picked. Remove hulls. Place in strainer or colander and cleanse by pouring water over berries. Pack closely in jars without crushing. Pour hot syrup over fruit to fill. Place rubber and top on glass jar and partially seal. Sterilize 15 minutes in hot-water bath.

Pears, Quinces, etc

Scald fruit for two minutes, then plunge into cold water. Remove skins, cut in halves or other desired shape, pack into cans, and pour over very thin syrup. Adjust rubber and jar cover and partially seal. Sterilize the length of time suggested in time sheet.

Tomatoes

Select ripe, but not over-ripe tomatoes of medium size and free from blemishes. Have canning outfit ready to use.

Wash jars and tops and sterilize in boiling water until ready to pack product. Rubbers may be placed in hot water for a minute just before using. Scald tomatoes, using cheese-cloth bag wire basket, crate or other device, by plunging into boiling water for one minute. After scalding dip into cold water. Remove the skin, beginning at the stem, and remove core, care being taken not to break tomato around core, thus allowing pulp and seeds to come out. The juice, however, may be used in filling jars. Fill jars with tomatoes, preferably whole ones, until within ¼ inch from top. A wooden spoon may be used to pack tomatoes tightly into jar.

To each quart jar add one level teaspoon salt. Fill jar with tomato juice (not water) until within one-fourth inch from top. Place rubber and top on jar, adjust upper wire of jar, but do not clamp lower wire. Place jars in steamer, wash boiler or commercial canner and cook for the required length of time; 22 minutes in hot-water bath.

Remove jars from canner, clamp down wire and invert to cool. It is best to cover them, in order to protect them from drafts, and thus prevent breaking of jars. It is best to examine jars after a few days to note any tendency toward fermentation or spoiling.

Beans and Peas

Blanch from five to 10 minutes in boiling water. Plunge into cold water. Pack in jars, add boiling water and one level teaspoon of salt to each quart. Adjust rubber and top and partially seal. Sterilize 90 minutes in hot-water bath. Remove jars, tighten covers and invert to cool. Prepare peas according to directions given for beans.

Corn

Corn ferments very quickly (due to the large amount of sugar it contains), hence but very little time should elapse between the time it is pulled and the time it is placed in the canner. The corn is ready to put up when the milk is thick and will not flow from kernel. As soon as possible after the corn is thick, husk and remove the silk. Trim and cut out all worm-eaten or blemished spots. Blanch 10 to 15 minutes in boiling water, plunge into cold water, then remove from cob. Fill cans, packing lightly to ¼ inch of top, adding to each quart one level teaspoon of salt. If there is not enough milk in corn to fill can, add boiling water, adjust rubber and top on glass jar and partially seal. Sterilize four hours in hot-water bath.

Kept Fit Through Two Wars

Ontario Sapper Praises Dr. Cassell's Tablets.

That a soldier should use and praise Dr. Cassell's Tablets is clear proof of the wonderful sustaining power of this great strength-giving medicine. And thousands of service men on land and sea are trusting to Dr. Cassell's Tablets to sustain them through all the hardships of relentless war.

Sapper Hartley.

SAPPER A. HARTLEY, OF THE A. COMPANY, CANADIAN ENGINEERS, whose home address is **906, TRAFALGAR STREET, LONDON, ONTARIO,** is one of many who have written in praise of Dr. Cassell's Tablets. He says:—"As a constant user of Dr. Cassell's Tablets I would like to add my testimony to their value. I used them when I was in the South African War, and, finding the benefit of them there, have taken them since whenever I felt run-down. I always recommend them, for I know they do all that is claimed for them. In my opinion they are the best tonic anyone can take for loss of appetite, poorness of the blood, or general weakness of the system. We have had a lot of hard training here, and some time ago I began to feel the strain, but I got some Dr. Cassell's Tablets, and the boys are surprised at what a difference they made in me. I mean to have some with me always on active service."

Dr. Cassell's Tablets put new life and vigour into weak, overstrained people. They nourish the nerves, enrich the blood, strengthen the general system, and create that snap and fitness which make life a joy. Take a course of them, and health and vital energy will soon be yours.

Dr. Cassell's Tablets

FREE SAMPLE.
On receipt of 5 cents to cover mailing and packing, a generous free sample will be sent at once. Address: Harold F. Ritchie & Co., Ltd., 10, McCaul-street, Toronto.

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-Spasmodic, and the recognised remedy for

Nervous Breakdown	Sleeplessness	Mal-nutrition
Nerve Paralysis	Anæmia	Wasting Diseases
Infantile Weakness	Kidney Trouble	Palpitation
Neurasthenia	Dyspepsia	Vital Exhaustion

Specially valuable for nursing mothers and during the Critical Periods of life.

Sold by Druggists and Storekeepers throughout Canada. Prices: One tube, 50 cents; six tubes for the price of five. War tax, 2 cents per tube extra.

Sole Proprietors: Dr. Cassell's Co., Ltd., Manchester, Eng.

Remove, tighten covers and invert to cool.

Greens—Spinach

There are many varieties of greens that are valuable as food and these may be canned at small expense. The method of canning is the same for all. They are best canned on the same day as picked. Sort and wash greens thoroughly. Blanch 10 minutes. Plunge quickly into cold water, then pack tightly in the jars and add one level teaspoon of salt to each quart. A small piece of bacon may be added to each jar of greens for flavor if desired. Fill jars with hot water, place rubbers and tops in position, and partially seal. Sterilize 60 minutes in hot-water bath.

HOW TO CAN FRUITS AND VEGETABLES

(Continued from page 493)

in other words, through sterilization at the temperature of boiling water (2) precautions which will prevent micro-organisms from coming in contact with the canned food—in other words, the hermetical sealing of the jars or cans.

The fact that there is air in a jar does not necessarily mean that the food will spoil. The air will not cause it to spoil, provided it is sterile, i. e., free from micro-organisms. A partly filled jar or fruit or vegetables will keep, provided the can, rubber, cover, and the air in the jar are sterile, and provided no micro-organisms can enter the can after it is sealed.

I cannot do better than to continue to quote Miss Hopkins. She goes on further to say: The reasons for canning food are (1) to increase the consumption of foods which supply much of the mineral matter and acids necessary to a healthy condition of the body; (2) to lend variety to the often monotonous winter diet; (3) to furnish nourishment in the form of starch and sugar; (4) to prevent waste of the season's fruits and vegetables; (5) to furnish the human body with a quantity of woody material or cellulose, which stimulates intestinal activity, thus preventing constipation and other digestive troubles. Since fresh and canned fruits and vegetables have come to form a part of the diet in winter as well as in summer, such diseases as scurvy (a disease resulting from a diet of salt meat, dried foods, etc) have almost entirely disappeared.

The foregoing gives our Farm and Home housewives, the assurance that canning of all vegetables can be successfully accomplished; it tells them exactly what causes foods to spoil, and how to prevent such spoiling; and finally Miss Hopkins gives our housewives good reasons for putting themselves to the trouble of canning fruits and vegetables for winter consumption.

In this article I will confine myself chiefly to methods of canning, and I call to your attention especially the latest and most successful—the so-called "cold-pack" and "hot-water bath" method, which is sure and safe, and leaves nothing to chance or "luck" being based on scientific correctness.

First, let us take up the matter of jars and rubbers. There are many different types of jars on the market—almost all of them good, provided they can be sealed absolutely air tight. Unless they can be so sealed, all your work of canning will have been in vain. Remember, this is the first and most important step in canning. Closely related to this matter of air-tight jars is the question of rubbers: You cannot expect to do successful canning with old rubbers, or cheap inelastic new ones. Only thick, soft and elastic rubbers should be used, and these should be new each season. But even new rubbers cannot always be relied upon; if they are of the cheap, stiff, hard and inelastic variety they may contain little or no real rubber. It pays to buy the best—they are the most economical in the end.

If you expect to do canning in quantities, and sell some of your products you will do best to procure an outfit such as Mr. Day describes in his "Canning Experience" article on another page of this issue of Farm and Home. You can then do your work in comfort outdoors, and use tin cans—cheaper and easier to handle and sell. I believe such outfits can be procured from $12 to $15 and up. But if you have to do your canning bit by bit in your own kitchen, and cannot possibly afford to buy any of the hot water or steam canning outfits, the next best thing you can do is to use your wash boiler, if it has a tight-fitting cover. Put a wooden rack in the bottom of the boiler—either one made of strips, or a perforated board, such as is shown in the illustration on this page. On this you can place the jars without fear of breakage. The boiler wants to be filled with jars, so they cannot tumble over, and it is best to place a strip of cotton around each, to prevent possible breakage by too close crowding.

So now, having your jars, rubbers and hot-water bath boiler ready, you are ready for the next step.

Use only good and fresh vegetables, and get them from the garden to the jars as quickly as possible. After cleaning and preparing they should first be "blanched," to eliminate possible objectionable acids and flavors, and to reduce bulk and set color. This "blanching" is done by putting the prepared vegetable in a cheesecloth sack and plunging it in boiling water, allowing it to boil for a few minutes (according to product) and then quickly dipping the sack in cold water for a second or two. After that it is ready to pack in the jars. Add sufficient water (if neccessary) and salt, adjust rubbers and tops, but do not seal tight. Place jars in boiler, put in enough water of about the same temperature as the jars, to within about an inch of the tops of jars, cover boiler tightly, and boil the required time, counting from the time it begins to boil. After that seal the cans, return to hot water bath, adding enough boiling water to cover cans several inches, cover boiler tightly, and finish the boiling or sterilizing. The time varies with various vegetables and fruits.

FOR SALE--Odd Lots FENCING

In the course of the year we find we accumulate a stock of odd-sized rolls of fence and special styles. The following is a partial list. We mail a complete list to any fence user applying.

Freight paid to Old Ontario stations on lots amounting to $10.00 or over. For delivery in Quebec and Maritime Provinces add 10%.

Order by lot number. Better give second choice. Will divide lots when desired.

FENCING

The following 3 lots are excess amounts of fences made on special orders, are first class and perfect in every particular. All No. 9 gauge, with stays 22 inches apart. All in 40-rod rolls.

LOT 1—300 rods, 8-bar, 32-inch hog fence, spacing 3-3-3½-4-5-7-7 inches at 45c per rod.

LOT 2—350 rods, 7-bar, 44-inch, space 5-5½-7-8½-9-9 at 39c per rod.

LOT 3—280 rods, 11-bar, 57-inch, spaced 2½-3-3½-4-5½-6½-7-7½-8½-9 at 62c per rod.

LAWN FENCES

Remnants of from 10 to 50 feet. Not painted. Will paint white or green for 2c foot additional.

LOT PEGOL STYLE
31.....30-inch, per foot $0.07 33.....42-inch, per foot $0.10
32.....36 " " " 0.09 34.....48 " " " 0.11

LOT ACME STYLE
37.....36-inch, per foot $0.10 38.....42-inch, per foot $0.1½
111..... 48 " " " 0.1½

LOT CLIMAX STYLE
42.....36-inch, per foot $0.11 44.....48-inch, per foot $0.14

ACME POULTRY NETTING

45.....24-inch, per 150-ft. roll $2.50

The above lots are on hand at our factory at Walkerville, and orders should be sent there direct in order to save time.

WALKERVILLE, ONTARIO

HORSE WITH A WOUND ON LEG

I have a horse, four years old, that has a sore on his hind leg in front of the joint, about as large as a five cent piece. It has been there for a year, healing up and breaking out alternately. B. M.

A surface wound of long standing that will not heal, canbe cured by cauterizing it with sulphuric acid, using just enough to moisten the wound. Do not put on any more than is required to wet the wound, for it will burn the leg if allowed to run down. Then oil with vaseline and bathe with a lotion made up as follows: Sulphate of zinc, 6 drachms, sugar of lead, 1 ounce, water one pint, all mixed together and well shaken before use. Apply lotion three times a day.

THE HORSE THAT CROWDS HIS MATE

A good method to overcome the habit of a horse that crowds its mate while plowing, is to take a piece of board about two inches wide, and about eight inches long, bore a three-quarter inch hole in the middle, put a wooden peg about three inches long into the hole, and tie the device to the back band of the harness of the opposite horse, with the pin towards the horse that crowds. After the horse gets poked in the side a few times, he will stop crowding. Another good method, if they crowd on the road when the snow is soft, is to change them around.

HORSE SPRAINED LEFT FORE LEG

I would like to have your advice about a horse that appeared lame the morning after having been led behind a buggy over snowy roads. I called in a vet and he said it was a sprain in the left front leg, and advised blistering, which was done. The lameness left him for a few days, but it is as bad again as ever. What would you advise me to apply. H. J. C.

Sprains are difficult to heal and there are so many ligaments found in the horse's leg that it would require a close examination to discover the one affected. Your vet's advice will be the best to take, and continue to apply his remedy of blistering continuously after it has successively healed up. The scabs you refer to are only the results of the blistering. The horse will be better resting while undergoing the cure.

WHY PAY FOR THE PURE BRED STALLION?

In reply to the question, "Why pay for the Pure Bred Stallion?", the June 1st issue of the Ottawa Valley Journal shows a profile picture of two geldings from the same mare. One horse was considerably smaller than the other. The smaller horse is five years old, the larger four years old.

The smaller was sired by a mongrel stallion and the larger by a registered stallion. They were sold at public auction, the smaller bringing $112, the larger $238. By using the mongrel $7 was saved in the service fee and $126 lost in the offspring. The owner uses a pure-bred stallion exclusively now—it pays.

WATER FOR CHICKS.

Little chicks as well as big should at all time have access to plenty of good fresh water. Where it is placed before them in a pan the old hen is apt to step on it and spill all the water. Then too the chicks will soon either drink it out or the sun will make it dry.

The plan that I have found satisfactory is not original with me, but I have used it a good many years with success. It consists in attaching two strips of tin or wire to the coop in such a way as to support a quart bottle upside down with the mouth of the bottle resting inside the pan and about a half inch from the bottom. Supported in this way the bottle is easily removable for filling. When filled and placed in position the water will feed down only as fast as the water in the pan is taken out. This makes a sort of fountain, and in the summer time the water will be kept fairly cool if the bottle is kept in the shade. P. H. R.

Fish Loaf.—2 c. cold flaked fish, 2 eggs, seasonings to taste, (curry pepper, Worcestershire sauce), 1 c. soft bread crumbs.

Add crumbs to fish, stir in eggs and seasonings. Place in greased mould and steam 30 min. Serve with sauce.

45-Acre Farm $800

A dandy for poultry and fruit, corn, hay and potatoes, money-making crops too: fruit and wood; cream collected at door; near neighbors, bordering river, only 1 3-4 miles to village; good 5-room house with running water; owner a mechanic moving to distant state makes low price $800. Travelling instructions to see it on page 4, "Our Spring Catalogue," copy mailed free.—E. A. STROUT FARM AGENCY, Dept. 612, 294 Washington St., Boston, Mass.

NEEDS NO PAINTING

Amatite stands alone in the ready roofing world. It is the one roofing you don't have to paint. Once laid, it will last for years without any attention from you. For sidings and steep roofs it is supreme. If you could only see how it is made—see the tough, fibrous felt, the dense, non-volatile saturating compound that keeps it water-tight, you would understand our claims. Try some.

A Roofing Triumph

The durability of Amatite is only one of its fine points. The same structural feature which makes it unnecessary to paint Amatite, gives it a distinctive and beautiful appearance. We refer to its sparkling, mineral surface. Improves the appearance of any building. The best buy in the ready roofing market.

SOIL FERTILITY—ITS ECONOMIC MAINTENACE AND INCREASE

(Continued from page 495)

tain combinations. It depends partly upon the condition of the soil and crop to be grown and partly upon the combination of fertilizing material and the amounts that we use. For instance, we might find a monetary profit from using 300 pounds, per acre, of a certain fertilizer, whereas an application of 500 pounds might result in a loss. This sounds paradoxical. A farmer sometimes reasons: if a certain amount is good, more is better. Not at all. That is not the way to look at it. The point is not so much increase in the yield as increasing the profit. We have to take into consideration the cost of the fertilizer; 300 pounds of a certain fertilizer will not cost as much as 500 pounds. Now, there might be an increase if 300 pounds were used, and there might be a greater increase if 500 pounds were applied. But the difference between the increase in yield from 300 pounds and that 500 pounds might not equal in value the difference in the price of 300 pounds and that of 500 pounds. There are many aspects to be considered. Every farmer who decides to use fertilizers should undertake some experimental work to ascertain the needs of his soil. Each experiment should have its check plot for the purpose of comparison.

We want our men to understand the requirements of their crops, to understand something in regard to the nature of their soils, and of fertilizing materials. We want them to understand fitst of all what rational farming means, namely, the return of a large proportion of the plant food which crops take from the soil, thus keeping up soil fertility without the direct purchase of plant food. There are only two means of doing this, one producing manure and its right use, and the other the growth of clovers. This I have already explained. Farmers should be taught that when they use fertilizers it must be as supplemental to all these rational means, rotation of crops, application of manure, proper cultivation of the soil, and so on. Then, we may hope, with a sufficiency of intelligence, to expect from the judicious use of fertilizers a profitable return.

ESSENTIAL ELEMENTS IN FERTILIZERS.

There are three elements which may be present in compounded fertilizers; when all three elements are present, we term that material a complete fertilizer. Our experiments have included trials with various forms of nitrogen, phosphoric acid, and potash, singly and in all combinations. Looking over the whole field, we conclude that in the larger number of instances where a profit has been obtained it has resulted from the application of a complete fertilizer; that is to say, from the use of a fertilizer that contained all three elements. There seem to be good reasons for such a result. My impression is that the chief function of the fertilizer is to raise the percentage of the very small amount of plant food that is immediately apailable for use. There is neper a pery large percentage of this immediately apailable plant food, and I think the function of the fertilizer is to increase it rather than to add to the total store of plant food in the soil, much of which is unapailable.

THE LAW OF MINIMUM.

We also know this fact, that the growth of crops is limited by the percentage of plant food which is present in minimum. If there is an excess of nitrogen, an excess of phosphoric acid, but only a small amount of potash, then the growth is in proportion, and is limited by that minimum percentage of potash which is present. I think that that is probably the chief reason why it is desirable and profitable in the majority of cases to apply a fertilizer which presents all three elements, nitrogen, phosphoric acid and potash. Of course there are cases in which soil conditions or special crop requirements call for nitrogen or for phosphoric acid or for potash. For such we recommend the application that seems desirable—perhaps superphosphate, perhaps nitrate of soda, and so on. But in the majority of instances we advise a complete fertilizer, for experience has taught us that from such there is greatest expectation of a profitable return.

MINIMUM EXPENDITURE FOR THE MAXIMUM PROFIT.

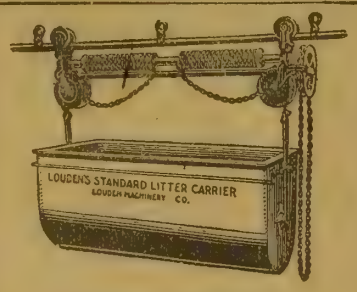
The next point is that the largest profits do not always result from the largest applications. That view is not generally held, especially in the provinces of New Brunswick and Nova Scotia, where in late years fertilizer agents and others have been advocating increasing the amounts of fertilizers, particularly for the potato crop. But, as I have said, it is not a question of yields: it is a question of profits. That is what we use fertilizer for, and we have obtained the best returns, dollar for dollar, from a moderate application of fertilizer. We might say that in the larger number of cases from five hundred pounds of complete fertilizer we have got a better monetary return than from an amount exceeding that, say from eight hundred or one thousand pounds. Some people apply as much as a ton to the acre. They have, of course, increased their yield but frequently not profitably, and that is what the fertilizer is for. That is one of our main arguments in connection with the application of fertilizer. We want the farmers to find out the largest yield from the smallest application; we want them to know what they are putting on the soil, and to be able to compare profits and yields. This knowledge is valuable for their future guidance.

DOMESTIC SOURCES OF POTASH, OTHER THAN MANURE.

Wood Ashes as a Potassic Fertilizer.

Wood ashes are essentially a potassic fertilizer, ashes of good quality, that is, dry, unmixed with sand, etc., and unleached, containing between 4 per cent and 6½ per cent potash, the average potash content being about 5½ per cent. This potash is in a soluble form and hence immediately available for crop use.

In addition to their potash they contain some 2 per cent phosphoric acid and from 20 to 30 per cent carbonate of lime, enhancing their fertilizing



The Carrier For You

IN choosing a litter carrier, one should consider all of the equipment necessary for a complete outfit: Carrier, Track, Hangers, Switches, and Swing Pole fittings. Do not place an order before learning of the many distinctive features to be found in Louden Equipment.

LOUDEN Litter Carrier

—is simple in construction, and easily operated. Carrier box is made of heavy galvanized steel, strongly reinforced with angle iron. Worm hoisting gear insures maximum speed and power. Track is of high carbon steel and is easily installed.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; for you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309

Read My FREE Offer:

To Mothers of Daughters. I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

Windsor, Ontario

value and making them, in a sense, an all-round fertilizer for supplying the mineral elements required by crops. And, further, they correct acidity, a condition detrimental to the thrift of most farm crops.

From 25 to 50 bushels of wood ashes per acre will furnish from 60 to 120 pounds of potash, the latter an ample dressing for even very light soils. They are not needed on heavy clay loams; indeed their use on such may destroy good tilth and do more harm than good. Their application is best deferred to spring, broadcasting preferably on a quiet damp day on the ploughed land, and incorporating in with a thorough harrowing.

For clover, corn and mangels, they will be found very valuable. Especially are they beneficial for orcahrds and for grapes on sandy loams. For turnips, mixed with one-third to one-half their weight of bone meal, superphosphate or base slag, they have similarly proved advantageous. But indeed there are few crops on light and gravelly soils, as also on vegetable loams inclined to be sour, for which wood ashes cannot be employed with profit.

SEAWEED AS A POTASSIC FERTILIZER.

Seaweed occurs on both our Atlantic and Pacific coasts (more abundantly probably on the latter) and may be collected in large amounts at little expense on many sea beaches, where it is thrown up by storms in prodigious quantities. It can also be collected in boats from rocks and from floating masses not far from the shore. There are many varieties; some are quite small, others attain large proportions, but all are valuable, though naturally differing somewhat in composition.

Seaweed is essentially a potassic fertilizer, being specially rich in potash, but it also contains notable amounts of nitrogen and other elements of plant food, so that it might be termed a complete fertilizer.

ANALYSES OF SEAWEEDS COLLECTED ON THE ATLANTIC SEABOARD.

Fresh seaweed is undoubtedly a watery manure, and it is this fact, no doubt—the cartage being a more expensive feature—that limits its use to those living more or less close to the shore. A part of this unless water may be got rid of by piling the seaweed on the beach for a few days before hauling to the farm. But notwithstanding its large percentage of water, seaweed compares very favourably, weight for weight, with barnyard manure, and it has this additional value that it brings to the farm no weed seeds or insects or fungus pests.

The essentially potassic character of seaweeds is well brought out by the analyses given, but it will also be noted that they are especially high in nitrogen. The differences in composition between the varieties may in part be accounted for by the stage of growth or maturity at the time of collection, and in this connection it is interesting to note that, for several varieties, collections made during the winter have shown a higher potash content than samples taken in summer.

The manurial value of seaweed is greatly enhanced by its ready decomposition in the soil; it quickly decays, liberating its constituents in forms available for plant nutrition. It is quite unnecessary to compost it, though little loss would ensue if composting with muck or other vegetable matter which would absorb and hold the decomposition products is resorted to, provided the heap is not exposed to heavy leaching rains. The weathering of seaweed alone is a wasteful process. On the whole, the best plan is to apply the seaweed direct to the soil, with which it will readily become incorporated. It is essentially of the nature of a quick-acting forcing manure.

Seaweed can be employed for all classes of crops, though it will be found most useful for roots, vegetables and those with an abundance of foliage, since it is essentially a nitrogenous and potassic manure. It has given excellent results as a top dressing for grass lands, encouraging the growth of clover more particularly. Its composition suggests that if a more complete fertilizer is desired it should be supplemented by superphosphate, basic slag or bone meal. Seaweed gives its best returns on moderately light loans that are warm and moist, and its poorest on wet, ill-drained, or heavy clays.

Liberators of Potash.

There is no substitute for potash in agriculture. It cannot be replaced in the plant's economy by soda or any other compound. But there are certain substances that act as excitants or liberators of the locked-up, inert stores of potash in the soil, and thus may be considered as indirect potash fertilizers. We shall discuss briefly two of these: gypsum and nitrate of soda.

Gypsum, commonly known in the ground form as land plaster, is a naturally occurring sulphate of lime. Although supplying lime it is of no value for the correction of acidity (sourness) of soils, for which purpose lime or ground limestone must be employed. But the furnishing of lime does not constitute its chief manurial value. It has the property of acting

FLEET FOOT

for Summer Wear at Work and Play

EVERYDAY

Don't work in heavy, leather boots this summer. Wear "Fleet Foot" Shoes. They are honest and sturdy enough to stand the farm work.

Easy and comfortable—light—sensible—and so much cheaper than leather.

LAKESIDE

When you go out in the evening, wear "Fleet Foot" White Shoes. There are plenty of different styles and shapes, for every occasion, day as well as evening—and they are far less expensive than leather boots.

Next time you go to town, be sure to see the "Fleet Foot" Shoes for summer wear.

Wear PALMER-McLELLAN'S Chrome Tanned Farm Boot

THIS SUMMER

POST PAID TO YOU

$4.50

"The Boot with the Moccasin Comfort"

Here at last is the perfect combination of boot and moccasin. The general shape is that of a moccasin, but the boot is built on a last, with a long solid counter to hold up the heel. It has all the easy foot fitting comfort of a moccasin, and, at the same time, it will stand right up and keep its shape with any boot.

The new chromoil leather used is simply wonderful. The chromoil tanning process produces a through-and-through, instead of a surface, waterproof, and a leather much stronger and more durable than any other. These new farm boots will not crack and shrivel when dried by the fire. They remain pliable in weather that freezes other oil-tans. They outwear any other boot of their kind on the market, and give solid comfort and satisfaction every day.

If you have any trouble getting these new Palmer-McLellan Chromoil Tanned Farm boots locally, mail us the price and we will ship you a pair postpaid.

FREDERICTON, N. B.

Write for free booklet describing Chromoil Tanned Leather and its merits.

on the insoluble potassic compounds of the soil, setting free for plant use a part of their potash. This is its most important function, and it is this property that has made it specially beneficial as a top dressing for clover, a crop that particularly reponds to potash. The application of land plaster is usually from 300 to 600 pounds per acre, which may be broadcasted on the prepared land and horrowed in.

Large deposits of gypsum occur in New Brunswick, Nova Scotia and Ontario, and as it is readily quarried and is comparatively soft material, land plaster may be purchased cheaply —in many districts at a lower price than ground limestone.

Users of superphosphate (acid phosphate) will have no necessity to apply land plaster, since this phosphatic fertilizer contains sulphate of lime as a necessary constituent.

Nitrate of soda is a well known, highly efficient nitrogenous fertilizer. It has been shown that crops "feeding upon a neutral salt like nitrate of soda, take up more of the nitric acid than of the soda." This soda acts chemically upon the stores of insoluble potash compounds, setting free a certain amount of potash, and thus rendering it unnecessary, in a certain measure, to directly apply a potassic fertilizer. It is this liberation of soda within the soil that is the cause of the deleterious action on the tilth or texture of heavy clay loams when large and frequently repeated applications of nitrate of soda are made, for the soda has the property of defiocculating clays, making them sticky when wet and refractory when dry. We should not advise any special application of nitrate of soda to make up for the lack of a potassic fertilizer, but it is obvious from what has been stated that its use to a certain degree obviates the necessity of such an application, especially on heavy loams.

CONCLUSION.

In concluding this review of the chief means whereby we may increase the soils productiveness, may I say that we should point out on all occasions to our farmers the various means and agencies provided by the governments—Federal and Provincial —for the assistance of the man on the land by information, by advice and by demonstration. There is no country better provided than Canada in this respect. There is a vast amount of educational literature to be obtained for the asking and inquires relating to agricultural matters are answered at a number of our educational institutions. Every farmer ought to be in touch with one or other of the Farms and Stations of the Dominion Experimental Farms System. If there is an Illustration or Demonstration Station in his district, he should visit it, for there he will find tried out in a very practical way the more important problems affecting the farming of the neighbourhood. Information by printed page or letter may be very valuable, but information gained by actual observation, as at an Experimental Farm, Illustration or Demonstration Station, will, in most cases, be more immediately effective. It has been at a number of these institutions that the largest average yields in Canada have been obtained; these heavy and remunerative yields are the direct result of the application of economic means for the increase of soil productiveness. Let us encourage and advise our farmers to avail themselves of their opportunities, and to adopt, as far as may be practicable, those methods which science and practice have alike shown to be rational and profitable.

COWS THAT HAVE BEEN WEIGHED IN THE BALANCE AND ARE FOUND WANTING

Taking it for granted that we have been putting out cows through the sifting process, so that we have learned which of them are producing milk from which de derive a profit and which do not, the question now is, "What shall we do with the unprofitable cows, the cows that do not pan out well?"

First, let us say that there will always be some among the number which, under the treatment ordinarily given dairy cows, do not show up well, that might if they were handled in a little different way. One thing which handicaps many dairy farmers is the tendency to look upon cows as if they were all run in the same mold, so that the care, feeding and treatment which we give to one will succeed when applied to the rest.

There is no greater mistake than this. Every cow has a distinct personality. The characteristics of each stand out by themselves. Every cow has a disposition all of her own. And every member of the herd must be studied, fed and otherwise cared for as if there were no others in the stable.

To show still more clearly how this works out, you may take a cow that comes quite near to the line of profitable production and by making a study of her characteristics, disposition and ability to turn feed into milk, handle her so that she will in a very short time come over on the side of the money makers. So little a thing as congenial surroundings and kind treatment from those who have the cow in hand will often work wonders in the milk pail.

The cow which is abused by other cattle in the herd, is afraid of her life and all the time scurrying for some place of safety is not going to be as profitable a cow as if she were holding an assured place among her companions in the yard. Take that cow out, make her feel at ease in her mind, or whatever stands for her mind, and it will not be long before she will rebound in a most surprising way. Instead of being a drag on the dairy, she will become a paying member.

Another cow may need a little different feeding than is given the rest. Before turning off any cow that comes up near the margin of profit, it is well to make experiments along this line. A change of feed, or more of some one kind, may be all that is needed to bring some cows up to a paying basis. This all takes time and patience, it is true. But it is time well spent and patience that will surely have its reward. Cows are high in price and difficult to get, and we ought to hold on to every one we possibly can.

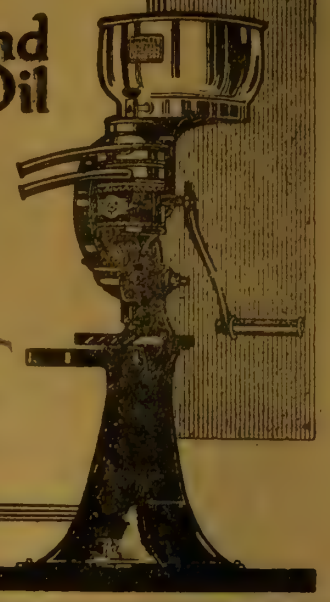
But after we have done all this, so that we are satisfied that we still have some cows that are not doing business enough to pay expenses, the question still persists: "What shall we do with these cows?" Because men are different in their temperament, and on account of the varying dispositions of cows, it is not impossible that a change of masters may save some of these discarded cows. You have seen that tried out; so have I.

More than one cow which had a fine record with one owner went bad upon changing hands. Men who buy these cows think when they find their purchase slipping down that they

DELICATE MECHANISM

such as the close fitting bearings and adjustments of a hand separator, demands a special lubricant in order to work efficiently.

Standard Hand Separator Oil



is especially manufactured for this purpose. It is absolutely free from all impurities, cannot gum, and besides giving superior lubrication where it is needed, protects the separator from seam rust and corrosion.

have been deceived, and actually become enemies of the one who sold them their cows with such a high recommend. All the time it may not be the fault of the seller or of the cow, either. It may be something about the makeup of the new master or of the conditions in the yard of stable to which the cow is newly introduced.

The other way around is just as true. A cow that has not been doing well in your herd, may, under the care of your neighbor, a man of different turn of mind, prove a very profitable cow. This is no particular reflection upon you, for it is not easy for any of us to change the disposition naturally given us; but for all that, the best thing we can do is to be fair and honest about it, tell the neighbor why we are offering the cow for sale, perhaps at a lower price than she would bring under other circumstances, and let him see what he can do with her. Many good cows have been developed from the castoff members of the herd.

Then, while all this has been done and some positively unprofitable cows remain, the only thing is to fatten them up and let them go for beef. There is always the temptation to sell these robber cows to go out of the country for dairy purposes, hoping that there will be no comeback on the part of the stranger who purchases them. Or a man nearer home may need a few to bring his stock up to the required size.

You may lead your friend to think that he is getting a good cow—for the money—but you cannot afford to do it; no man can. Better by far, give these cows a few hundred pounds of good feed and let them go for beef. Conscience violated never can be stilled with a few dollars.

But whatever we do, the best way is to get our herds on a paying basis. It may cost something to do it, but it is economy in the long run.

E. L. VINCENT.

FLIES IN THE STABLE

The pesky stable flies are a great source of annoyance to the cows and the cause of considerable loss of milk and vitality. They are seldom killed by the lash of the cow's switch and when disturbed they rise in a mass for two or three feet and then settle down on another part of the cow's body. As they are not attracted by bait it is not easy to catch or kill them.

One bright dairymaid of observing mind saw their peculiar habit of rising and settling in a bunch, so she pinned some sticky fly paper to a sack and laid it over the cow's shoulder. In this way she soon trapped most of the flies. By doing this early in the summer you will prevent their breeding and, as they do not travel expect on an animal, you will be rid of them for the season.

Another effective way to get rid of the stable fly is to catch them in a net. Make it of a fine quality of mosquito netting at least 18 inches long. On the end of a short handle tie a wire loop 15 to 18 inches in diameter and fasten the net to the loop. As the flies rise in a cloud you can catch many of them with a swift scoop of the net. In a few minutes you can get most of the flies which annoy the cows.

FEEDING DAIRY CALVES

In the nation-wide movement for an increased food supply, which has swept the country during the past three years, the livestock man has been urged to increase production, and to save his calves.

Prof. Chas. I. Bray, of the Colorado Agricultural College, has prepared the following on the feeding of calves for the benefit of those who may desire information upon the subject:

"Whole milk at 20 cents or more per gallon is too expensive to feed to calves, and the butterfat can be economically replaced by grain feed. Skim milk contains all the feed nutrients of the whole milk except the fat, which is not needed for the dairy calf after two weeks old. Corn meal, ground oats, or linseed meal may be used to advantage as supplementary feeds.

"Milk fd to ssttttaaoooo0rc

"Milk fed to calves should be warm, sweet and clean, and fed at regular mealtimes in uniform amount and in clean, scalded buckets. Occasionally very rich milk will be found to disagree with the calf. In this case the milk may be diluted with clean, warm skim milk r milk having a comparative low fat content may be substituted. A dairy calf of the smaller breeds should get about one gallon of milk per day, divided into three feeds daily for the first ten days and two daily feeds afterwards. Calves of the larger breeds will take more. After two weeks old, sweet, warm skim milk may gradually be substituted for the whole milk and the quantity gradually increased to one and one-half gallons per day, and to two or two and one-half gallons after two and one-half months old. Large calves may be given more. To check scouring in calves, reduce the feed and give one or two teaspoonfuls of dried blood in the milk daily."

Grass Stain on Colored Goods.

Wash stain out if fresh or use a paste of molasses and soda. Spread paste on stain and let stand for several hours. Wash in usual way.

The Testing Time!

Russia Prospers

During the first eight months of Prohibition in Russia the Savings Banks reports show savings increased 5,000 per cent. (net).

WHEN the test of the world-conflagration called for every ounce of strength in every available man to stem the tide of destruction, one of John Barleycorn's greatest friends, Russia, was the first to abolish the Traffic because it could not meet the test. In good time, when her hour of test arrived, New Brunswick banished the great Drink curse let us hope forever!

After the war, in his turn, John Barleycorn is going to put New Brunswick to the test. Prohibition may again be voted upon after the war.

Every bit of lax enforcement and indifference is just so much ammunition for him to use against us. How does Prohibition meet the test?

Russia—

Some idea of the enormous effect of Prohibition is afforded by the wonderful example of Russia. In spite of the fact that millions of producers are in the army the savings of the people enormously increased. In 1912 and 1913 they were saving, per year, about $20,000,000. In the first five months under Prohibition they saved $60,000,000. In 1915 the banks took in $265,000,000. For the first half of 1916, the Russian people saved $300,000,000!

The Dakotas—

Town and city population in South Dakota under License increased 168 per cent. in 20 years. In the Prohibition state of North Dakota it increased 494 per cent.!

In "dry" North Dakota, for the year 1909, 2,789 men produced $19,137,000 worth of manufactured goods. In the "wet" Dakota it required no less than 3,602—***813 more men***—to produce only $17,870,000 worth of manufactured goods, or $1,267,000 ***less!***

In 1890 commitments to Insane Asylums in "dry" North Dakota were 40 persons per 100,000 ***more*** than South Dakota. After twenty years of Prohibition they were ***forty less!*** And the Prohibition State began the period with only about half the population of its neighbor!

South Dakota has since adopted Prohibition.

Help to Enforce Prohibition

Permanent Prohibition in New Brunswick demands strict enforcement between now and the day when Prohibition may again be voted upon after the war. The whole task of enforcement must not be left to the officers of the law alone. Everyone should help. Eternal vigilance is the watchword.

THE DAIRY COW

(Continued from page 499)

DAIRY COW RECORDS PAY.

In order to make profits from any cows they must be good cows; that is, they must be healthy, of good temperament, of the dairy type, good size, of great capacity for consuming feed, regularly heavy feeders and above all heavy producers.

It is impossible to tell the profitable from the unprofitable cows in the herd unless you have individual records of the milk and fat produced.

The profitable dairy cow must give over 5,000 pounds of milk testing 3.5 per cent fat, each year. To know the value of a cow her total annual yield of milk must be known. The only way to know this is to keep a record of her daily milk yield.

Such records are being kept by hundreds of successful dairymen today. Many of these men attribute their success to the keeping of these records. Why not give the thing a trial if you are a dairyman? It will increase your milk product. It will lighten your labour since your interest will be increased in your work and "interest lightens labour." It will show you the unprofitable cow, the "boarder." You cannot get rid of her too quickly.

For weighing the milk a spring balance may be secured for from one and a half to four and a half dollars. If your local dealer cannot supply you write the Animal Husbandry Division, Experimental Farm, Ottawa, for particulars. A small platform scale is fairly convenient, but the spring balance is preferable.

Many farmers keep record of the amount of food fed to individual cows. If you would like to do so, sample forms will be sent free on making application to the above address.

RECOMMENDED VARIETIES OF FIELD CROPS

By F. S. Browne, B.S.A., Assistant Agrostologist.

Importance of Roots to the Stock Feeder

Field roots are relished by every class of live stock, and numerous experiments have shown that, the best results in feeding are often unattainable if they are not included in the ration. In Denmark and Sweden, the present recognized importance of the bacon and dairy industries is due in no small measure to the liberal feeding of field roots to hogs and dairy cattle.

In a great many parts of Canada ensilage corn can be profitably grown, and, in such sections it is, at present, recognized as the most economical crop to grow as forage for stock. In spite of this, however, field roots, on account of their peculiar value in adding palatability to the ration, are still grown in even the best ensilage corn sections of the country. Further, the root crop is a safe venture in many parts of the Dominion where the climatic conditions are such as to render the results with corn just a little too uncertain.

Variety Testing

Ever since the establishmer . of the Dominion Experimental Farms , in 1886, one branch of the work has been the conducting of variety tests with the various varieties of field roots. the experience gained bu such experiments, has shown that reliable information, as to the merits of a certain variety, can be obtained only after that variety has been tested for a number of years. Accordingly only varieties that have shown superiority after repeated tests are recommended below.

Mangels.

Varieties Recommended

Giant Yellow Intermediate is a high yielding variety of good feeding value. The root is ntermediate in shape, smooth and yellowish orange in colour. It has a small top, is easy to handle and keeps well. Generally speaking, the variety can be recommended for any part of Canada where mangel growing is profitable.

Danish Sludstrup is a yellow, intermediate variety very simil.r to Giant Yellow Intermediate. It can be recommended for British Columbia and Eastern Canada.

Mammoth Long Red or Gate Post is a long red variety nearly cylindrical in shape with a strong vigorous top. The roots, though large, are usually rough and prongy, thus making the crop somewhat difficult to handle. It is, therefore, somewhat in disfavour in certain sections. Neverth less, it is a splendid yielding variety and the roots are of excellent feeding value and keeping quality.

This variety can be depended upon throughout Canada generally.

Giant Half Sugar White is a long greenish white variety, somewhat rough and irregular in shape with a heavy top. On good soil it will produce a good crop of excellent feeding value. The roots keep well and are of particular relish to stock. The variety has done fairly well throughout Canada, but seems best adapted for British Columbia, Manitoba, Ontario, Quebec and Prince Edward Island.

Giant Yellow Globe is a very heavy yielding variety, but of comparatively low feeding value. The roots are uniformly round in shape and light yellow in colour. The tops are small and the crop is easy to handle. The

PEERLESS PERFECTION

The Fence For Real Protection

gives life time service. Is made of the best Open Hearth steel fence wire, all impurities burned out, all the strength and toughness left in. Makes the fence elastic and springy. Will not snap or break under sudden shocks or quick atmospheric changes. Galvanized to prevent rust and the coating will not flake, peel or chip off. Can be erected over the most hilly and uneven ground, without buckling, snapping or kinking. Every joint is locked together with the well-known "Peerless Lock." The heavy stay wires we use prevent sagging and require only about half as many posts as other fences. Send for catalog. It also describes our farm gates, poultry fencing and ornamental fencing. Agents nearly everywhere. Agents wanted in unassigned territory.

PEERLESS FENCE

THE BANWELL-HOXIE WIRE FENCE CO., Ltd.
Winnipeg, Manitoba Hamilton, Ontario

Get a Frost & Wood Mower

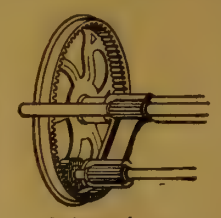
Hay-time is money time on the farm

Use a cranky, wasteful out-of-date mower and you may throw away a whole season's hay. These are the days for efficiency. Make a wise expenditure for a Frost & Wood Mower, and you save in crop, in horse flesh, in time, in money.

Frost & Wood Mower Cuts Any Crop

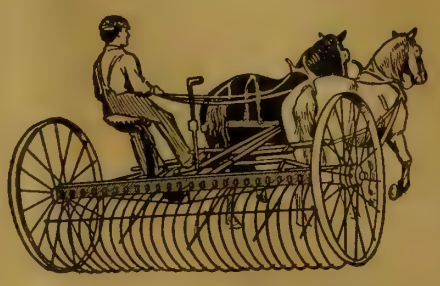
IT WON'T FAIL YOU.—It's a light draft machine. The splendid roller bearings and easily controlled levers eliminate friction and make it easy for a boy or girl to use. Immensely strong, with heavy brass bushings where wear is greatest. Heavy high-carbon steel cutter bar can be set in a second at any angle. Knife guards are high-grade tough malleable iron. The F. & W. is a splendid, serviceable mower, always ready for hard work, even with "green" help.

Space prevents reference to the many splendid features of the Frost & Wood Mower, but the "Internal driving gear", as shown here must be mentioned. The driving gears are meshed on the inside of the main drive —they travel in the same direction—there is no tendency to fly apart, or to snap the cogs—no loosening or rattling of parts and connections, and the knives begin to cut at the first step of the horses. This means quicker work and longer life to the machine.



Internal gear drive means big power

Frost & Wood Rakes



Built for Hard Quick Work

Because a Rake looks a simple machine to make don't put up with cheap, inferior workmanship—get a F. & W. and save real money. Teeth of special quality, tempered steel, and arranged in convenient sections of two or three. Self-dumping, discharging load automatically at light pressure on foot lever. Made of steel, amply strong, and clean working, the F. & W. Rake gives a lifetime of splendid service.

Our nearest agent is ready to give you full particulars and advice on this or any implement, or write to-day to us or our nearest branch for illustrated catalogue.

FROST & WOOD CO., Limited,

TRURO ST. JOHN, N. B. CHARLOTTETOWN

variety produces a good crop in most any part of Canada, but seems best adapted for the prairie provinces.

Swede Turnips

Good Luck is a high yielding, purple topped variety of good feeding value. The roots are oval in shape and usually uniform. It is an easy variety to handle and the keeping quality is excellent. The variety can be recommended for Canada generally.

Perfection is a smooth, globe-shaped variety of the purple top class. The roots are of good feeding value, keep well and are easy to handle. The variety yields well in any part of Canada.

Hall's Westbury is a purple top variety that has been grown throughout Canada for a number of years. The roots are oval-shaped and usually large. On good soil the variety yields well, and the feeding value of the crop is excellent. The variety can be recommended for any part of Canada.

Canadian Gen is a very smooth, uniform variety of the purple top class. The roots are globe shaped and medium sized. In wet seasons, the individual roots often produce extremely long necks, which make the crop unsightly and decrease its value. Usually, however, the yield is high and the feeding value fair. The variety can be recommended for Eastern Canada.

Hartley's Bronze Top is one of the best varieties of the bronze top class. It usually gives a good yield, and the crop is of first class feeding value. The roots are medium in size and somewhat near tankard in shape. Although somewhat un-uniform the roots are usually smooth and easy to handle. The variety can be recommended for Eastern Canada.

Kangaroo is a popular variety in the Maritime Provinces. The roots are tankard-shaped and sometimes quite rough and hard to handle, but keep well. The yield is usually good and the feeding value excellent. The variety may be recommended for the Maritime Provinces.

Field Carrots

Varieties Recommended.

Improved Short White is a half long, white variety, sometimes rough and un-uniform in type, but of excellent keeping quality and feeding value. It can be recommended for any part of Canada.

Mammoth White Intermediate is very similar to Improved Short White, but it is not adapted to such a wide range of conditions. It can be recommended for the Maritime Provinces, Southern Alberta, when grown under irrigation, and British Columbia.

White Belgian is a large, white intermediate variety that usually yields well. The feeding value is, however, only fair, and in wet weather the roots are inclined to crack. For this reason the variety can be recommended for the Prairie Provinces only.

Ontario Champion is a long large white variety, un-uniform in shape, although the roots are usually smooth. Owing to its length, it is sometimes broken in handling. It is, however, a heavy yielding variety and can be recommended for Ontario and Quebec.

Danish Champion is a light yellow intermediate variety. The roots are usually smooth, un-uniform and of medium size. The variety yields well and the crop is of high feeding value. The past four years' results would indicate that the variety can be recommended for Eastern Canada.

Quantities to Sow

With good seed, of strong vitality, the following quantities may be recommended per acre:—

Mangels: 7 to 8 pounds.
Turnips: 2 to 3 pounds.
Carrots: 3 to 4 pounds.

Time to Sow

Mangels, sow as soon as the ground can be conveniently worked in the spring.

New Field Husbandry Building, Ontario Agricultural College, Guelph.
Barns at the Ontario Agricultural College Guelph.

MARTIN-SENOUR

"100% PURE" PAINT

(Made in Canada)

is saving the farmers of Canada hundreds of thousands of dollars by protecting their homes and barns from wear and weather. This pure, reliable paint spreads easily and is the cheapest in the end, because it covers 900 square feet of surface per gallon and lasts far longer than the cheap prepared paint or hand-mixed lead and oil.

Write for "Farmer's Color Set" and "Town and Country Homes". Just what you'll need in planning your painting. Mailed free and postpaid. 168

The MARTIN-SENOUR Co.
LIMITED
GREENSHIELDS AVENUE, • • MONTREAL.

Turnips, may be sown comparatively late; two or three weeks after mangels.

Carrots, sow about the same time or a little later than mangels.

How to Sow

Field roots are a hoed crop and should preferably follow hay or pasture. The seed should be sown in rows 25 to 30 inches apart. On land free from weeds, that is inclined to dry out, or in districts where rainfall is light, seeding may be done on the flat. Under ordinary conditions, however, it is advisable to sow in shallow drills which have been run up, with the drill plough, and flattened to about one-thrd their original height with the roller.

Hand seeders are usually the most satisfactory, and one with a light roller attached, so that the soil is pressed firmly around the seed, should be used.

WOOL PRIZES AT MARITIME EXHIBITION

The attention of sheepman in the Maritime Provinces is called to the prizes offered for wool in the fleece at the Nova Scotia Exhibition, Halifax, and at the Charlottetown, P. E. I. Exhibition. The amount offered in prizes for fleece wool at each of these exhibitions is fifty dollars, and the prizes are well worth the consideration of our wool growers, in addition to making a name and standard for the wool of these Provinces. There are three classes in which to enter the fool, and these classes pretty well cover the grades of wool grown here. The first class covers the medium wools, such as that of the Shropshire. The second class covers a little coarser wools, and longer in length of the staple, such as the Oxford, Hampshire, etc., while the third class takes in the coarse and lustre wools, such as those of the Leicester, Cetswold and Lincoln.

It is hoped that the farmers will at this time retain two or three good fleeces, in order that a good showing of Maritime Provnce wools may be on exhibit at these exhibitions this fall.

G. E. O'BRIEN.

MARE THAT HAS TREMBLING FITS

While working a three year old mare, she suddenly commenced to lift her legs high, then staggered while walking, and also took violent fits of trembling. In half an hour she was as well as ever. What was the cause of the trouble and its remedy? J. M.

The symptoms you describe appear to be due to megrims, or stomach staggers. Anything that interferes with the flow of blood to the brain, from indigestion, from a tight collar, or from a tumor pressing on the brain, will produce staggers in horses. Give your mare a physic drench consisting of bitter aloes, 8 to 10 drams, common soda 1 tablespoonful. Dissolve and mix in warm water, and if the staggers come from her stomach it will relieve her; she may never have another attack. Examine and see if it was caused from a tight collar. When the medicine has worked off, a teaspoonful of bromide of potassium in her grain feed twice a day for a week or so, will act as a tonic to her nerves.

COSSAR STOCK FARM,

Shearing and Dipping the Farm Flock

The shearing season is now over for the most part and the wool is being sent to market. The extremely cold weather experienced in the Maritime Provinces during the month of May badly handicapped the work. Sheep that were shorn early in the season suffered a great deal from the chilly winds and damp weather. They could scarcely keep warm even in the sheds, and not a few of the weaklings succumbed. Another handicap when proper shearing weather arrived, was the scarcity of shearers, many of the men who used to carry on custom work along this line, are in the trenches. Some sheep owners have their fleeces ready in time to take advantage of sales through Co-operative Wool Growers Associations.

The ruling high prices prove of unusual interest to the growers and every half-pound of wool was carefully taken from the sheep's back, and those who sell cooperatively are sure to realize top notch prices. Reports from Quebec show that wool co-operatively sold bought as high as 56½ cents for medium combing, unwashed. Other prices were as follows:—Low medium combing, 55½ cents per pound. Coarse, 53½; black, and rejects, 45 cents.

A sheep that will shear from 8 to 9 pounds of wool is realizing for the owner from $3.00 to $5.00 at the very least, thus making herself a paying proposition from that standpoint alone. She is a valuable asset, hence it is only right that we handle what she produces as it should be handled.

Under our eastern climatic conditions, the proper time of shearing can be placed roughly from the middle of May to the first of June, depending upon the prevailing weather. The one thing to guard against is the contraction of colds amongst the flock due to damp cold weather following the removal of the natural covering. There is very little chance of such weather after the end of May. Many, of course, who purpose showing at the larger fairs shear much earlier (about the first week in April) or else not at all, simply keeping the fleece trimmed. On the other hand some flock owners allow their sheep to suffer on into the hot weather of July by making them carry a fleece that they consider is becoming heavier all the time because of an increased secretion of yolk. They forget that many sheep in the flock are all the time losing portions of their flock that drop off naturally because of the new growth coming in.

There are two methods of shearing, by hand and by machine, both of which are extensively practised, but in Australia, United States and Canada the modern machine shear is rapidly displacing the old method of shearing by hand. Perhaps the greatest reason for the increasing popularity of the machine is the fact that a man who has never done any shearing can learn more quickly and more easily with a machine than he can by hand. It runs on much the same principle as a horse clipper; in fact many firms handling horse clippers also sell adjustable sheep shearing attachments. Secondly, when a man once becomes familiar with the use of the machine he can shear many more sheep in a day besides making a much neater and smoother job. Thirdly, with the machine there is less danger of cutting into the skin of the sheep and thereby causing undue loss of blood. Fourthly, there is not the same strain on the wrist, which means something as shearing is an arduous task at the best of times. Fifthly, and very important in this era of high prices, a greater amount of wool is obtained because the machine gets closer to the skin, taking the fleece off evenly and uniformly.

One disadvantage attached to the machine is the fact that it is almost essential to have some form of power to facilitate operations. The best of hand operated machines provide harder work as a rule for the man at the handle than for the man at the shear. Where large numbers of sheep are kept this power can be applied by means of the overhead extension rod system whereby several machines can be operated simultaneously. For smaller farm flocks, however, the power is best supplied by means of the smaller engine, ½ or 2 h.p., usually sold by the same company that handles the shearing apparatus. I have in mind one company that handles a small ½ h.p. engine with shearing attachment, complete for $50. The hand operated machine combining both horse clipping and sheep shearing attachments, can be purchased for from $15 to $20. Hence, considering the advantages, the prices are by no means prohibitive.

There is, of course, a right and wrong way of holding sheep while shearing, and to describe it in detail would occupy too much space in this article. Suffice it to say that the right way can only be learned by observing other men at work, actual practice, patience, perseverance and the keeping of the sheep in as comfortable a position as possible. It is the application of some system to your method of removing the fleece that tends to gradually increase your speed. If any bad cuts are made in the skin, it is wise to apply a little pine tar or similar disinfectant to keep the flies and maggots away.

The fleece removed, it should either be thrown on a large slated table, where it is spread out, or else spread out on the shearing floor. In either case the side nearest the skin should be down. Remove all dung locks and extremely dirty wool and folding the sides in, roll tightly from tail to neck so that the best wool at the heart and shoulder shows on the outside of the roll. It is the quality of this superior wool that determines the grade. Having rolled tightly, tie securely with only paper twine and pack each fleece in large sacks, keeping lamb, wether, buck and ewe fleeces separate. Do not shear when the sheep are wet; for even though it may add to the weight, the fleeces grade lower because of the presence of so much moisture, and hence greater shrinkage. Furthermore, never store the wool away in a damp place where it will take on a large amount of moisture. Be sure to sweep the floor after each sheep is shorn.

Dipping

It is only right that the process of dipping should be dismissed along with that of shearing as the two operations are more or less linked. No flock owner expecting to get the best results in a sound, healthy, heavy clip can ignore the importance of dipping in this regard. One of the very best investments in connection with the large or small flock is to spend a few dollars in providing an annual bath for every member. The sheep appreciate it. The ticks and other vermin do not, and he who does not dip his sheep at least once a year should try going without a bath. He might then have more sympathy for the flock. It is criminal for a man to own a flock of sheep covered with ticks, tice and scab that suck the very life blood and consume the major portion of the feed given primarily for the sustenance of the flock. It is just exactly like having dirty fence corners that pollute with weeds the fields of your neighbors. The vermin infested flock is a source of contamination for every other flock in the neighborhood.

Besides ridding the flock of ticks there are two other objects sought in dipping—(1) the improvement of the skin's condition, and (2) the increase in growth of wool. The condition of the skin is improved in that dipping effects a cleansing which tends to promote healthy action of the pores. This stimulated and healthy action of the pores in turn stimulates the growth and general quality of the wool. In short, the sheep—body, skin and fleece—is muh invigorated after a thorough cleansing.

In many countries it is the practice to dip twice a year; in fact, it is compulsory in some cases, but with us it is generally conceded that one dip keeps the flock clean. Only, however, with the proviso that this one dip is performed in a thorough manner and with the proper material. The best time to dip is shortly after shearing, shy two weeks or more, when one is certain as to the warmth of the weather. The whole flock, lambs as well as ewes, can be dipped at the same time, though it is better to dip the lambs a few days after the ewes. This means more time, though, and time is a very

(Continued on page 546)

Some Labor Saving Devices Useful Around Farm Buildings in Lessening Manual Labor

In view of the tremendous wastage going on in the world and the absolute necessity of conserving all our interests for the benefit of increased production, it behooves us to look carefully about and find out if possible where the cost of production can be lowered to the advantage of both the producer and the consumer. The price of country produce is already too high to the latter in many lines; not because the farmers are getting too much for their goods, but that the cost of production is too great.

Under present conditions and for some time to come no doubt, improvement will have to be brought about by a more general use of labor saving tools, implements and machinery on the farm. The substitution of horse-power, steam power, gasoline and electric power, wherever possible, for that of man power has revolutionized conditions in the manufacture of factory-made goods and while not so easily applied to farm operations a great advance has been made in that direction and there seems to be no good reason why the same principles should not more generally be applied to farm operations.

Whatever may have been the cause of slower development or adoption of labor saving devices in the past, the time has come when greater need of food products will create a demand for this line of action which should become more generally practised.

One of the great causes of increased labor is found in the bad arrangement of buildings. These should not be too far away from the house and should be so arranged that the least possible walking from one to another, will be necessary in the daily chore work of the place. Then too, the arrangement inside should be made with the same labor saving idea in mind. Long rows of cattle are more conducive to economical work than short rows scattered here and there in different parts of the barn. Classes of stock getting the same kind of feed should be near together and feed from the loft should fall near the mangers to avoid carrying it long distances.

For economy of both feeding and cleaning, box stalls and pens should be kept in straight rows as much as possible. Where this is done watering devices can be placed to much greater advantage. Where there is any considerable number of stock kept a manure carrier will be found a great labor saving implement in the stock barn. Ta have a special purpose machine always ready for its particular use is most satisfactory and economical and few will be found more useful for its own purpose than the manure carrier. The wheel barrow will answer for a few animals, but when it comes to fifteen head or more the carrier should be a part of the equipment, if economical, easy and rapid work is a consideration, which it should be on every farm.

To some it may seem an extravagant statement, but we make it without any hesitation, that all farm barnyards should be cemented. To do this is not a very expensive operation. It may be done at odd times by the regular farm force if desired or a gasoline mixer can be employed for a few dollars that would do the whole job on an ordinary yard in one day. In addition to its value as a manure saver, which is very great, the yard is then always clean and the work can be done in comfort besides being much more expeditious than wadling through slush or running around the barn to escape a mud hole; and beside the whole place can be kept more sanitary and wholesome for live stock as well as the human worker.

To have proper eave-troughs on the buildings and to keep them in repair always, saves labor and loss of manure by washing from the falling water off the roofs; in addition to this it economizes in drawing many tons less of water and spreading it over the land.

A good water system is essential in the economical working of a farm. The only watering place to be seen on many a farm is the old wooden trough supplied by a hand pump, where the cows have to resort summer and winter for their daily needs, often in spring and fall up to their knees in mud and in winter shivering over a hole cut in the ice. This condition should be improved by the construction of a permanent cement tank and platform for summer use and drinking basins for winter, both supplied by an automatic system from a storage tank kept by windmill, gasoline or electric power.

Both in the grain barn and in the milk room there should be sets of scales for properly weighing all kinds of produce, not only as a matter of convenience, but as a necessity in knowing and keeping account of the farm sales and purchases.

Then a good fanning mill is a necessity. To get good results in the harvest one must sow good seed. A mill is the only economical method of separating the best seed out from amongst the lot. Hand selection may be practised as a basis of improvement but the mill must be the main source of separation. Have a good one with a bagger attachment. It will pay.

For handling the grain there should be a two wheeled truck on hand. It will save a lot of heavy lifting and will be greatly appreciated by the boys. They can be had with a bagger attachment for holding the bag when filling, which is a great convenience when man-power is scarce. A good clean scoop should be kept in the grainary for no other purpose than handling grain. On too many farms the scoop is used for all kinds of work, even cleaning the stables, and when needed for grain it is too filthy to use without cleaning; anyway a shovel used for such work is very unsatisfactory for shovelling grain. For this purpose it should be clean and bright so that the kernels will slide off easily and quickly.

A good set of tools of all kinds is essential to quick and efficient work about the buildings. Old forks with broken handles and tines, shovels with the edges torn and ragged and baskets or measures without handles are only apologies for proper and useful articles, which should be discarded at the earliest opportunity.

Some still cling to the ancient method of unloading hay and grain by man power. In the face of the fact of high-priced labor no one can afford to do this. Even though one can manage with his own help it would be a patriotic as well as profitable thing to invest a few dollars in a horse-fork, sling, ropes, pulleys, etc., and let one of the boys, if not needed at home, give the neighbors a lift.

Where ensilage is used as a part of the ration a good basket, a large wheelbarrow or a big truck, should be used for carrying it about the stable. Feeding forty or fifty head of cattle is a quick job with the right equipment but a tedious process with a small basket where it first has to be thrown down and then shovelled over again into it. One handling from the silo to the cows is sufficient. On a good cement floor one man, with a proper outfit, can convey sufficient feed for an ordinary herd at one operation and no stable in these days of cheap and durable cement products, should be without a good smooth floor of this kind. On the outside of the stable in addition to the use of cement over the barnyard, this material may be profitably used for many purposes to save labor. The walks from the house should be of this kind. So many farmers from fall to spring travel over disagreeable walks or run around mud holes to avoid getting over their boot tops, when a few barrels of cement and a few loads of gravel would make the passage clean and pleasant, that the wonder is that almost every farm in the country is not equipped with one or more of them, especially when the work can almost all be done without expert help. On account of its cheapness and durability, cement should be used for many permanent jobs that will save labor in renewing every few years, besides being very much cheaper at the first in building. Floors of all kinds, troughs, well curbs, milk and ice houses, gate posts, and many other things should be built of cement which will not only cheapen the cost of production, but make the labor of the farm more congenial.

SHEEP PROTECTION ACT AMMENDED

The sheep owners of New Brunswick will be delighted to know that the long mooted ammendment to the Sheep Protection Act has been passed by the Legislature of the province, in compliance with the resolution passed by the New Brunswick Farmers and Dairymen's Association last winter. The Act, as ammended, will be published in our next issue. It gives the sheep owners of the province the protection they have been asking for for many years.

The New Brunswick Standing Field Crops Competition for 1917

There will be competitions this year in Standing Crops in the several counties of the province where competitions were held last year, viz:—Carleton, Gloucester, Kent, Kings, Madawaska, Northumberland, Restigouche and Victoria. The rules and regulations governing the competitions in the respective counties will be the same as in the past. While the department formulated a well defined set of regulations for this purpose when the competitions were first instituted, several years ago, the officers of Agricultural Societies that took the oversight of the work in the var-local officers, it would not be fair to alter the rules somewhat to better suit local conditions in their respective counties. As the prospective contenants in the different counties have already planned their 1917 fields, according to the rules laid down by their loca lofficers, it would not be fair to them to make any radical changes this year. The rules will, however, be revised to lend uniformity to the competitions of 1918 in all the counties participating. An effort will also be made to extend the competition so as to include all the counties of the province in 1918 and thereafter.

It is the duty of officers of Agricultural Societies in the counties where competitions are held, to cooperate with representatives of the Department of Agriculture in extending the scope of this work, by inducing as many as passible, members of their societies, to make one or more entries. Members of Agricultural Societies will make their entries to the Secretary of their local Agricultural Society, who will forward all the entries from his Society to the person who has charge of the work for his county, as follows:—

Carleton Co., F. S. Taylor, Florenceville; Gloucester, Madawaska, Restigouche and Kings Counties to M. A. MacLeod, Superintendent of Agricultural Societies, Sussex; Kent Co. to Antoine Belliveau, District Representative, Richibucto; Northumberland Co., J. S. Bremner, Jr.; Chatham; York Co., Harry Slipp, Queensbury; Victoria Co., S. B. Wright, Andover; Westmorland Co., A. J. Colpitts, Point De Bute.

Any member of an Agricultural Society in any of the above mentioned counties, is eligible to make entries. The members and officers of Agricultural Societies should see to it that at least five, and as many more as possible of their number, participate in one or more of the competitions held in their respective counties.

The competitions will thus become representative of the whole county and the object for which the competitions were organized will be attained viz., the home growing of more and better seed. Entries close July 25th. Will you do your part? Thank you.

IMPORTANCE OF AGRICULTURE

Agriculture must not only be self-supporting, but, in large degree, agriculture must support our other great industries. Without agriculture, the coal and iron would be left in the earth, the forest would be left uncut, the railroads would be abandoned, the cities depopulated, and the wooded land and waterways would again be used only for hunting and fishing. Shall we not remember, for example, that the coal mine yield a single harvest—one crop—and is then forever abandoned; while the soil must yield a hundred—yes, a thousand crops, and even then it must be richer and more productive than at the beginning, if those who come after us are to continue to multiply and replenish the earth.

Lightning Protection on the Farm

With References and Quotations From Prominent Authorities.

By W. E. Clark

The enormous loss due to the destruction of buildings by fire and lightning each year, is occasioning much comment, and strenuous efforts are being put forth to minimize this loss. It is estimated that the fire and lightning loss in the United States and Canade for the past year is $254,000,000.00, which means an average loss of $700,000.00 every day. In Canada alone the loss is $26,000,000 annually.

In the cities restrictions are being adopted making it impossiblo to build the easily combustible structure which has flourished in the past; in all modern cities fire districts are laid out, and combustible structures are forbidden within the limits of these districts. In addition, outside these business districts, the tendency is to discourage by Legislation the building of residences or any other structures, unless same are largely protected against fire from outside influences.

There is a tendency to regard a fire loss lightly, due to the fact that Insurance minimizes the individual loss. As a matter of fact every dollars' worth of property burned up is irretrievably and forever lost, and is a burden on the community at large, just the same as a tax.

The fact that banding together and thus reducing the risk by transferring it to other and distant shoulders cuts down individual liabilities for large amounts, does not in any way alter the situation. Every individual in Canada loses $3.50 per year on account of fire and lightning losses, whereas in Europe the per capita loss is only .48c; there they make every effort to prevent the fire, on this continent we try to extinguish it; there they figure that a fire is an absolute loss of money, here we consider it an exchange of our property for ready money. This, in general is the situation as pertaining to cities, towns and villages. It is indeed serious, and worthy of the best efforts of the Dominion and Provincial Governments to minimize the loss.

Attention is called to a much more serious phase of the matter, via, unprotected condition of farm buildings as compared with those in the city where fire protection and fire extinguishing are receiving increasing consideration. The average building is an easy prey to the flames once they are started. It is almost impossible for the farmer to arrange for capable fire fighting facilities so that he must look to prevention rather than means of extinguishing the fire. Fire once started in a farm building, either a residence or an out-building, rapidly gains headway and before the meagre fire-fighting facilities can be put into operation, has gone beyond the point where it can be extinguished. As a rule the supply of water is very limited and is generally quite distant from the point of fire, and in addition the individuals capable of fighting the fire, are limited, comprising on an average not more than two persons. This makes it all the more important that the farmer should fight hs fires before they occur.

It is unnecessary to dilate on the fact that farm buildings covered with metal roofing and metal siding is protected against fire from outside influences; this fact should be self evident to everyone. The Canadian farmer is becoming more in the habit of using metal coverings every near, and in this respect is considerably in advance of his fellow farmers in the U. S. where wooden buildings are more common and where the fire loss is consequently even larger than Canada.

The danger from forest fires is rapidly diminishing as the forests decrease. but in many sections of Canada and during long dry spells in the summer and fall months there are still vast possibilities of damage from flying embers due to forest fires. All liability to lose or damage from this and many other causes is entirely nullified by the use of metal coverings on buildings, and in the case of residences by building brick walls and using metal shingles, which makes an artistic and pleasing combination, durable, economical and fireproof.

The loss to farm buildings by fire may be controlled to a large extent by exercising care, but in regard to the loss from lightning, even the most careful family is as liable to suffer from the destructive effects as the most careless one, providing their buildings are not protected against lightning.

In considering this subject the farmer will usually have in mind lightning rods as a protection, and while lightning rods have a value, metal roofing properly applied gives better protection from lightning besides added protection against fire, sparks from the engine, etc., which might burn a wooden roof with a lightning rod on.

Lightning not only destroys property but destroys life; and anyone having experienced, in the country, a heavy thunder-storm with its accompanying discharges of lightning, would certainly not regret a slight additional expenditure for the sake of immunity from the effects of lightning. The feeling of terror usually engendered in the minds of the family, conscious of their helpless and unprotected condition, is more conducive to a high state of nervousness with its accompanying physical break-down, than almost any other cause. As the spring comes on, this subject recurs more frequently and in the hot summer days, with their heavy thunderstorms, lightning becomes a very constant source of dread and trouble.

Very careful observation has finally established a fairly good understanding as to the operations of electricity and the methods of minimizing the effects of same; lightning is a discharge of a large amount of electricity in a very short space of time, and whatever medium conducts it from the clouds to the earth suffers in the transmission, unless the medium is a first class conductor of electricity, and of sufficient size to take care of the full volume of the discharge. Trees, poles and buildings, on account of their height generally, act as conductors. In the case of buildings, an electrical discharge is generally accompanied by fire. and a severe fire in the midst of a thunderstorm, brings to light about the most helpless condition of humanity.

Below is a quotation from an article by Prof. E. S. Keene, North Dakota, Agricultural College;

"Buildings with metal roofs that are properly connected with the earth are far better protectors from lightning than could be given by rods. Buildings that are completely covered with sheet metal and well connected with the earth, are practically lightning-proof. Covered in this manner, buildings have been known to be repeatedly struck by lightning with out the least damage. The ground connections may be made of metallic rods that extend well into the earth, and are securely fastened to the metallic rofing, on the buildings. It must be remembered that the ground connections is a positive necessity and too much care cannot be exercised in its construction. The ground connection must be of considerable area and extend well into the mosit earth; a piece of galvanized iron pipe driven into the ground 7' or 8' makes a good "ground"; large buildings should have two or more of such "grounds."

In view of the above the use of metal shingles or metal roofing when put together, make practically a solid sheet of metal over the roof. In connection with these, use metal eavetroughs and conductor pipes or down spouts and drive the galvanized iron pipe into the ground near the termination of the Conductor Pipe. It is well to fasten the Conductor Pipe to the upper end of the galvanized iron "ground" by soldering or wiring them tightly together.

It is essential that the Conductor Pipe be properly maintained and not allowed to become unjointed, thus breaking up the continuous path over which the lightning may discharge into the ground.

Quotations from Prof. Wm. H. Day, Dept. of Physics, Ontario Agricualtural College, i.e., as follows:—

"For eleven years this Department has gathered reports regarding buildings that were struck by lightning; of some 600 cases we found that 53% of the buildings struck were burned. Twenty Insurance Co.'s got reports for me last year and we found from their reports that out of every 200 buildings struck by lightning 42 were rodded and out of every 200 buildings struck by lightning only three were rodded, showing 94½% as the efficiency of lightning rods in preventing strokes. A building with a metal roof properly grounded is well protected; in case a stroke occurs to that building the roofing and the ground wires or other conductors will cary off the stroke as well as if there were rods on the building."

Quotation from a report of the National Board of Firo Underwriters, Edition of 1913:—

"Protection against lightning is advisable on country buildings or isolated buildings and on all buildings, wherever located, having elevated features such as tall chimneys, high peaked or gable roofs, steeples, etc. The ordinary condition causing a lightning discharge is a cloud charged with electricity at a greatly different potential from that of the earth. The difference of potential is finally sufficient to break down the stratum of air between the earth and clouds. and an electrical discharge takes place. The high points take the discharge and unless some less resistive path is provided. from this point to the ground than the structure to be protected, the lightning will follow the next best course to the earth. generally causing damages to the structure and frequently sarting fire. In general, all-metal buildings need only to be "grounded". Iron used in any form for this purpose should be thoroughly galvanized to prevent corrosion. Conductors should have as few joints as possible, these to be mechanically secured and be protected from corrosion."

You will note from the above that the Fire Underwriters, which is another name for the National Fire Protective Association, recognize the value of the all-metal of "Metal Clad" buildings as a protection against the effects of lightning.

A quotation from a report of the Mutual Fire Prevention Bureau, Oxford, Michigan, looking after the interest of the Mutual Fire Insurance Companies:

"Every elevator or mill in the country, even if only built this year, could afford to tear off their wood shingle roof and buy metal roof, and siding and thereby reduce their rate enough to pay for the entire outlay in a few years. We will do everything we can to point out to the property owner that his interests demands the substitution of iron cladding and iron roof over wood construction."

It will be noted that the above is from a Mutual Bureau and it is to their interest to speak the truth, and to cut down the losses as much as possible because the cost of the Insurance depends upon the total loss.

Quotation from Farmers Bulletin No. 367, U. S. Department of Agriculture:—

"The greater part of the Annual loss of property by lightning is chargeable tod farm buildings and their contents, and live stock in the field. A lightning conductor means a body of conductor that will lead away a lightning discharge. Metals are good examples of conductor bodies. The ordinary farm building is not difficult to protect from lightning flashes. A Metallic roof properly connected to the earth affords ample protection to the buildings from lightning. It will not do to stop the conductor within a few inches of the ground; there should be an unbroken metallic path from the ridge of the roof into the ground.

The vital points of the connection are two; first, to reach premanently moist earth and second to secure a perfect metallic joint between the down spout and the earth conductor."

The point to be emphasized is that buildings covered with metal and properly connected to the ground, should not be attached to. or connected with buildings not protected, otherwise the unprotected building may be struck by lightning and be set afire and of course the flames will communicate to the contents of the other building. It is important that all connected buildings be similarly protected.

Every Insurance Company will give a reduction in rates for metal clad, properly grounded buildings, and this reduction will eventually more than pay for the slight additional cost of the metal covering in the first instance.

It is also well to note that all the authorities unite in stating that the Sheet Metal should be heavily and thoroughly protected by galvanized coating in order to be an efficient conductor as well as making it proof against corrosion.

With the above facts in mind there is no reason why every farmer should not protect his buildings and stock by the use of Metal Coverings, whenever a roof has to be replaced or new building erected; thus removing the fire menace, as prevention is better than [illegible] not available.

Have you got a silo? If not, and you have half a dozen cows or over. make up your mind to start now and get one if possible. Serviceable stave silos can be built very cheaply. While it is generally admitted that corn makes the best silage. oats and peas, barley, alfalfa, etc., will all make excellent silage, and will provide you with the necessary succulent milk-producing food, both for the months when pasturage is dry and also for the winter season.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

ARE YOU MAKING OR LOSING MONEY?

There never was a year in the history of farming in the Maritime Provinces, when it was as necessary for farmers to exercise the best methods they know in the production of farm crops, as in 1917. O. S. Rayner of the Colorado Agricultural College says:—

The "rule of thumb" method will not always be successful on farms. A prescription that will fit one farm will probably not fit another. Farms are not alike.

The doctor gives a certain kind of medicine for measles, but who would expect that same medicine to cure a broken leg?

"As I write, I have before me the records of 54 farms in one community. Five of these are farms of 160 acres. On these farms the amount of capital invested varies from $2,500 to $9,000. The number of acres in crops varies from 10 to 142, and amount of live stock is five times as much on one farm as another. The difference between receipts and expenses, or the actual farm income on these five farms varies promiscuously from $100 to $1,000, yet they are all 160-acre farms. Cases of this kind can be multiplied. These are facts, and we must reckon with them.

Many conclusions may be drawn. An important one is that each farmer must study his own problems. His business may be so organized that where he is losing money, his neighbor may be making money. What may apply to his neighbor's farm with profit, may not apply to his. Perhaps a set of farm records is the best way of attacking this problem.

Patronize your nearest Co-operative Wool Sales organization. You are assured as high a figure for your wool as professional buyers and local dealers offer, and your chances are good for receiving a great deal more. We have seen this repeatedly tried and proved.

THE FARMER'S ARMCHAIR CRITIC

Anybody can ride through the country and criticize farmers. Their work stands entirely in the open—their mistakes and shortcomings are not hidden. They are told they should do this or that, and they should not do that or this. And if they took all the advice and suggestions coming their way most of them would go broke. It is easy to see why some plans fail while others succeed, but many who talk and write about farming fail to understand the difficulties that every farmer must meet. It is a simple thing to tell just how to raise a great corn crop, but it is a difficult thing to do it. One little mistake, or a few days' sickness, or the lack of dependable help at a critical time, or a bad storm, or drought may completely counteract many days of hard work in the corn field. It is easy to work out on paper how to make a profit on a bunch of hogs, or how to pay for a farm in so many short years, but a multitude of unforseen difficulties may intervene and the best-laid plans go awry. Farming operations are subject to so many vicissitudes that the business is complex, and calls for early and late watchfulness and unending precaution if it is to be made a success. The vital factor in crop production is nature, and nature is never twice alike. But the very fact that nature is such an important factor in farming makes it, for the man who understands, the most fascinating of all vocations. No farmer need be ashamed of his job. The successful farmer may well feel the greatest pride in his achievement."

"NATIONAL SERVICE" ADVERTISING TO SHOW EVERY CANADIAN HOW TO HELP WIN THE WAR.

Only one who has recently visited Great Britain or France, can realize the contract between the grim, determined, "win-the-war" attitude prevalent in those countries, and the somewhat detached interest so large a proportion of the people of Canada show in the struggle. To arouse the whole nation—to enlist the wholehearted, practical co-operation of every Canadian—the National Service Board of Canada announce that a systematic campaign of education will begin at once in the press throughout the country.

Canada was by no means slow to grasp the importance of military service, and our production of munitions has far exceeded the most optimistic predictions. But far more than that is required if our whole power is to be exerted in the Empire's fight. Those who can neither fight nor make munitions, can each in his or her own way render valuable service.

With the slogan "Fight, Work and Pay", the publicity campaign planned by the National Service Board combines an earnest appeal for this universal service, with practical suggestion for giving it. Increased production—conservation of food—thrift—and the purchase of War Savings Certificates—these are the keynotes of the advertising, which, it is hoped, will have results comparable with those which have been secured by similar publicity in Great Britain. The nature of the appeal, and its vital importance, should win for these National Service messages the closest attention and heartiest response.

WRITE

Occasionally one of our many friends sends us a mighty good short article and expresses the hope it is written according to the way we wish it. We haven't any particular rules for anyone to follow. Our readers may write on three sides of the paper, spell by ear, punctuate according to the dictates of their conscience and their articles will be acceptable if they only say something.

Many who have ideas or know things which would be valuable to others are kept from writing because of some absurd fear that they can't comply with certain fool rules of the editor about manuscript, punctuation, spelling, etc. Don't worry about these things. The Maritime Farmer wants your opinions, your experience, your problems, your suggestions. Ninety per cent of our 11,000 subscribers are working out their salvation by the same steady hard road and while everyone has his own individual problems, that same individualism helps him to work out ways and means of overcoming many of them. There is no royal road to farming, but the ruts for many a man can be filled and the grades smoothed down by knowing of the experience of someone else who has overcome under similar conditions.

Knowledge and originality are not monopolized. Your experience and suggestions are needed. The columns of your farm paper is the most logical and far-reaching place to express them. If you have a question to ask or a message for other farmers remember that is the thing, not the paper on which it is written, the grammar or even the spelling. Our office is yours.

MORE REASONS AGAINST THE $40 BULL

F. B. Shaw, writing in the Jersey Bulletin, says:—"I am pleased to note the remarks I have caused about "Knifing the Culls," and still contend that I am right. Now, we are all endeavoring to keep up the beauty of our Jerseys. Can we do so by using a long, narrow-headed bull, with a pair of hips like a toboggan slide, a set of ribs that look like a roller had run over him, and an eye in his head about the size of a bullet? Yet I saw just such a bull shown at the Hastings, Mich., fair, and was sold after the fair and said to be a good one. I also said he was worth more as a steer.

"I have seen bulls advertised fit for service for $40. If these bulls were properly raised they would bring more for beef, and if not properly raised they would be unfit to head any herd. We sold a yearling bull early this year for beef for $51.

"A man might buy a calf, raise him and take chances, and get a good bull for $25 or $30; but, as I said, a man could not run fast enough to give me a $40 bull.

"The above explains why I do not own an auto. My partner does most of the work, keeping a man part of the time. I have no money to blow; neither am I able to buy the long-priced bulls; but any man who wants a good bull and bred right can buy him worth the money."

* * *

Necessity is the mother of co-operation.

* * *

"The farmers of this country can defeat the German submarine, and when they do so they destroy the last hope of the Prussian," says Lloyd George to the English farmers.

* * *

Don't lose your temper; let the other fellow do that.

A CITY BOY AND A FARMER

The Two Sides of the Story.

A recent number of the St. John Standard contained a news item purporting that a city boy who went to work on a farm in Kings County, had to work from 5 a. m. until 9 a. m. at an unfamiliar task, and failing to satisfy the farmer he was sent home because he had been heard to cough. The Standard hands out a piece of salutary advice to farmers and exonerates the boy as follows:—

"The following communication received by The Standard reveals a serious situation. If the campaign to have the boys help on the farms is to be a success the farmers must realize that boys from the city have to be given a chance to get accustomed to the work on the farms and also an opportunity to have some social life. The boy mentioned in the letter went to the country to do his best and worked from five in the morning until nine at night and the only excuse the farmer gave for sending him home was that he coughed."

The Mother's Side of the Story

A boy left a good home in the city to do his bit by helping a farmer. The farmer's voice sounded all right over the telephone and the mother let the boy engage to go a certain day. The boy arose at five and worked faithfully at chores of all kinds, cleaning stables, piling wood, driving cows to pasture, harrowing, etc. He was given to eat his meals and retired at nine. Each day the food was fair, but monotonous. He saw only the kitchen and the room over the kitchen where he slept. He found it lonely as he saw only the farmer and his wife, but resolved to stick to it and say nothing. To his surprise one morning at the end of the week the farmer told him he was going to take him to the station to go home. The only excuse the farmer was that the boy had a cough and he did not want him. The boy was never known to have a cough and has been home some hours and has not coughed once. It was an excuse to get rid of the boy as he may have coughed when over-heated with unusual work. The boy was taken to the station at Anagance where he had to wait five hours for the train and the farmer did not even pay his return ticket.

Mothers, be more careful than I was where you send your boys.

G. L. PICKETT.

The Farmer's Wife Tells Her Side of the Story.

Anagance, N. B.,
June 18, 1917.

Editor The Maritime Farmer:

In the June 9th issue of the St. John Standard, I read a letter by one, G. L. Pickett, warning mothers to be more careful than she re letting their boys go to help farmers. I would ask space in your columns to warn the farmer to be more careful re what city boy he takes to his home, if he does not wish farm life misrepresented and he or his honest toiling wife given more work.

Following is the true tale of this farmer's troubles with this city boy. One day the farmer received a letter from a city boy saying that he was 17 years old and would like to come and work on the farm. He can milk cows, harness horses and all such farm work. The farmer says, that is just what he needs, so telephoned the boy's mother asking if she was sure her son could milk a cow. She says, he can milk all right. The farmer asked if she thought he could milk 6 cows. Her answer seemed good and all right and she seemed anxious that her boy get to the country. So a day was set. The boy came; the farmer met him at the train and when they arrived home dinner was ready. The city boy ate heartily at the farmer's well spread table—he now calls the food fair, but monotonous.

After dinner was over, the farmer started the boy harrowing with an old team that almost knows enough to cross the field straight without a driver. The boy asked the farmer what he would say to the team to start them off. The farmer told him as best he could, but it seemed useless. The farmer stayed near to help him along and teach him. In all that afternoon there was about one hour's work done, and from three to four hours spent. But the farmer made the best of it, thinking, "Perhaps I can teach him to help with the chores." Milking time came at twenty to six o'clock. The farmer started the boy at milking and found he could not do that job, nor could he be taught. The farmer tried and tried again to teach him. The wife tried also at different times to teach him to feed the calves, but all was useless. The farmer tried him again at the harrowing without avail, nor could the boy harness the team. He put the collar on upside down. The farmer gave that job up so tried him at a little ten year old boy's job, ranking wood. The wood can be seen if any one wishes to call, but sitting in the sunshine on the wood pleased him best, so the farmer decided to ask no more of him, but let him please himself for a few days. He did gather a few sticks and ranked them in place late one evening, but now says he worked from 5 a. m. to 9 p. m.

He now comments also on his sleeping room. He ought to rest for a few nights with our boys in France. A letter from one soldier that had slept in the same room for years, says "Oh, that I could be back and rest once again in my comfortable room and clean bed!" The farmer thought it all over and decided, the first day he could leave his work to take the boy to the station. On Friday, business called the farmer to Anagance and he took the boy along, paying him according to his hire. The wife gave him a lunch. He could sit idly by for hours on the farm, so sitting at the station ought to be just as pleasant, but evidently it was not, by his story or his mothers. They speak also of him being overheated. I never saw him move quickly enough to get overheated to cause him to cough. I have no need to explain about the cough he had, I think it will explain itself in time.

I would not wish anyone to think all city boys are like this one. There are boys that are doing good work on the farm and farmers are thankful to them and their parents for the help in our time of need.

The Farmers Wife,
E. M. H. BURLOCK.

DISTRICT REPRESENTATIVES OF THE N. B. DEPARTMENT OF AGRICULTURE

Agricultural Colleges and Agricultural Departments have been in existence and have been supported by the provinces as well as by the Dominion, but the great difficulty has been, that they were not in actual touch with the farmers throughout the year. Bulletins and pamphlets have been issued in millions, but they have failed to reach their objective; agricultural meetings and organizations have been arranged but still much remains to be done.

In order that there may be closer connection between the farmers of New Brunswick and the Department of Agriculture, District Representatives will be appointed if suitable men can be engaged. These men must have had practical experience and be familiar with the every day farm operation, and in addition have a training at an Agricultural College. The war has so depleted the ranks of young college students and graduates, that the Department will not be able to open as many offices as required.

Their work will consist, (1) in getting well acquainted with the people, (2) carefully studying local conditions; (3) assisting agricultural societies; (4) advising in every other activity in agriculture which will include work re stock, grain, potatoes, fruit, drainage, dairy, fertilizers, etc.

Each man will have an office properly equipped for his particular work where agricultural references will be kept, and which will form a connecting link between the county and the Provincial Department of Agriculture.

The District Representative is not expected to know everything about agriculture, but is in a position to obtain information upon any subject within reasonable time, and is expected to know how to put the findings at experimental farms and colleges into practice. Co-operative movements, such as the selling of wool and lambs, purchase of seed grain by a community, purchase of fertilizers by societies, purchase of machinery which might be made to serve many instead of one, purchase of pure bred animals instead of grades, will be activities in which the District Representative must take up actively. In short, he must study and support every movement which is for the welfare of the farmer and in many cases must be the originator of movements.

Mr. E. M. Taylor, of Little Shemogue, will open an office at Gagetown to serve the counties of Queens and Sunbury. Mr. Antoine Belliveau will be located at Richibucto for Kent Co.

Mr. Taylor has completed three years and Mr. Belliveau two years at Agricultural Colleges.

An office will be opened to serve Albert and Westmorland counties immediately a man can be engaged for the position.

The farmers in these particular counties will be well advised, to keep closely in touch with the District men.

Offices will be opened in other counties immediately arrangements can be made. The counties of Kings and Carleton have Agricultura Schools, and these will be used as the headquarters for the District men.

ASSISTANCE TO DAIRYING IN NEW BRUNSWICK

Dairying seems to be declining in some sections of New Brunswick, and doubtless those men have legitimate reason for turning their attention to other activities, due to the peculiar location and opportunity, but in those parts where dairying is more or less well established, considerable attention is to be given to the problem in order that competition may be met, and the greatest possible return made to the milk producer.

Kings County is the outstanding dairy section, and the majority of New Brunswick factories are to be found there.

During the week of June 25th, a demonstration in cheese making, for the benefit of the makers, will be given by Mr. Geo. Barr, of Ottawa' assisted by Mr. C. W. MacDougall of Sussex. Public meetings will also be arranged.

Centralization seems to be the best method of making a high class product. In the counties of Kent, Westmorland, and Albert there is a large tract of country where dairying in some form is carried on, but where commercial dairying has not reached its height, and where there is considerable room for legitimate development.

On Tuesday, June 12th, the members o fthe Legislature for these three counties, met in the offices of the Department of Agriculture and discussed with the Minister and Secretary, and Mr. Harvey Mitchell, and C. W. MacDougall, a scheme for a contral creamery to be located in Moncton, which would serve the three counties. Moncton is the best location due to railroad facilities and opportunity for disposing of by products such as buttermilk.

Mr. Barnes outlined the methods that have been so successfully followed in Nova Scotia and Prince Edward Island and recommended that similar procedure to that followed at Scotsburn be adopted.

After considerable discussion among the members, the motion made by Hon. C. W. Robinson, seconded by Mr. Magee, that the proposition be approved and supported, was unanimously consented to.

During this year a series of meetings will be arranged for in these three counties, where the entire proposition will be placed before the farmers for their endorsement. The factory is to be run on a co-operative basis, which eliminates all speculation. The Department of Agriculture is prepared to undertake all educational work and general supervision until the plant is upon a paying basis. Experienced, well qualified men will be in charge of the work.

Undoubtedly such a factory will assist the people very greatly in placing their product upon a satisfactory and more profitable market, and is without any doubt the only means whereby the keen competition from the West can be met successfully.

Labor is becoming scarce, and the woman's place upon the farm should be made as pleasant as possible. If she can send the cream to a modern factory with cold storage facilities, and receive as much or more money in many cases, such a factory will be of great value.

Leaflets explaining the idea and method of procedure will be prepared later.

There is nothing to prevent the southeastern portion of New Brunswick from having the largest creamery in the Maritime Provinces.

GROUND LIMESTONE

Experimental Farms Note

From results obtained at the Experimental Station, Kentville, N. S., it would appear that ground limestone is likely to play an important part in Nova Scotia agriculture, particularly in helping to produce soil conditions favourable to the clover plant.

It would appear that two tons of ground limestone per acre is a decidedly profitable investment, as is shown by the tests given below. The fertilizer used on duplicate plots was a 4-8-10 (4% nitrogen, 8% phosphoric acid, 10% potash), mixture applied at the rate of 500 pounds per acre in 1914, the first year of the test. One series of plots were limed once during the period at the rate of 2000 pounds per acre in 1914, and the others were not, the object being to find out the value of lime for subsequent crops.

In 1914 the yield per acre of unlimed, fertilized oats was 57 bus. 8.2 lb.; limed and fertilized, 68 bus. 6 lb.; unfertilized and unlimed, 45 bus. 12 lb.

In 1915 the unlimed, fertili ed clover yielded 4567.5 lb. per acre; limed and fertilized, 6760 lb.; unfertilized, unlimed, 2405 lb.

For the 1916 crops [illegible] were: unlimed and [illegible] per acre; limed and fertilized, 17 bus.; unfertilized and unlimed, 8 bus.

In the spring of 1916, in order to [illegible] duplicate plots were [illegible] seeding time [illegible] acre of 4-8 fertilizer (4% nitrogen, 8% phosphoric acid).

The results in 1916 from these plots were: unlimed, fertilized 1914 and 1916, 15 bushels per acre; limed, fertilized 1914 and 1916, 23.75 bushels per acre.

Another experiment [illegible] poor piece of land in a [illegible] acre,

(Continued on page 548)

HORTICULTURE

THE THIRD SPRAY

Written by G. E. Sanders and W. H. Brittain at the request of the United Fruit Companies.

During the past winter we have repeatedly predicted that Ontario would have a light crop of fruit in 1917 and that there would be a chance for Nova Scotia to market a large portion of the 1917 crop locally in markets that are normally supplied from Ontario, and that it would be good business for Nova Scotian growers to have their product well sprayed and of as high quality as possible for such markets as were available.

Our prediction of a short crop in Ontario in 1917 was based on the fact that the blackspot or apple scab was so prevalent in 1916 that it infected the leaves early in the season and caused them to drop from two to three weeks earlier than normal. Our experiments in Nova Scotia have taught us that premature dropping of the leaves must result in a light bloom and a short crop the following year.

The first accurate information in regard to the Ontario crop is now at hand. The Ontario apple blossom is going to be very light—the lightest in many years—and it is doubtful if the crop will be as large as last year.

We get a large measure of satisfaction from having predicted accurately last November the quantity of bloom and crop that Ontario would have in 1917. We based that prediction on the quantity of blackspot that was allowed to become prevalent in Ontario orchards in 1916, through lack of spraying. There is a lesson here that every apple grower must learn in order to be successful, he must learn that spraying influences the quantity of apples produced the following year more than it does the quantity the current year. The quality of the 1917 crop depends on his spraying of 1917, but the quantity of the 1917 crop depends on his spraying of 1916. If we neglect our spraying this year, we may, if blackspot is as common as usual, have the same report sent out for the condition of Nova Scotia orchards in 1918 as Ontario has this year and for the same reason. It would seem good business for the Nova Scotia grower tt have the quality of the fruit that is normally supplied by the Ontario this year to be placed on the market, stock, as high as possible, and also good business for him to have the quantity of apples produced in 1918 as large as possible, in other words it would seem good business for the grower to spray as usual this year.

The directions given for The Third Spray in Circular No. 8 of the Dominion Entomological Branch are as follows:

Time.

When the blossoms fall.

Material.

Lime sulphur 1.006 sp. gr. or about 2 gals. to 100 gals. of water (1-50) adding powdered arsenate of lime 1½ lbs. to 100 gallons.

Application

Use 200 lbs. pressure and a Calyx nozzle.

Pests Destroyed

Apple scab, Pit rot, Codling moth, Fruit worms, Budmoth, etc. If green apple bug is present add nicotine sulphate, 1 pint to 100 gals., using a drive nozzle as in previous sprays. In spraying for green apple bug, clean cultivation should be practiced until July 7th, and the trees banded with tanglefoot as recommended for the second spray.

We would warn growers to be most careful as to the strength of lime sulphur used in this spray, diluting the homemade material as indicated in page 10 of Circular No. 8, and also to reduce the quantity of arsenate of lime as indicated.

If it is proposed to use Bordeaux for the fourth spray and no apple scab is present in an orchard at the time of the blossoms falling, it might be best to defer this spray for a few days, applying it from two to four days after the blossoms fall. This would enable the grower to defer the fourth spray in the same way, thus giving greater protection to the apples from fall fungus and reducing the amount of russetting. The longer the fourth or Bordeaux spray is deferred after the blossoms, the less russetting will result, for as the hairs are shed from the young fruit and the skin becomes smooth and waxy the apple becomes less susceptible to Bordeaux injury or russetting.

Bordeaux should not be used for the third or calyx spray as it gives the maximum amount of russetting when used at this period.

Where the power sprayers have enough capacity the new spray guns introduced by the United Fruit Companies are giving the greatest satisfaction resulting in more thorough work, the saving of one man and greater speed. It would seem worth the while of growers investigating this spray gun to see if their pumps will handle it.

If you have not a copy of Circular No. 8, drop a card to G. E. Sanders, ANNAPOLIS ROYAL, N. S., for one.

THE CODLING MOTH—ITS HABITS AND CONTROL

The insect that causes the greatest amount of annal loss to the Ontario fruit grower is, no doubt the codling moth and yet probably not one orchardist in fifty has ever seen the moth itself. It is very small, flies only at night, it not attracted with either lights or sweets and consequently can rarely be obtained except by breeding it from the worm. Everyone, however, is familiar with the worm or caterpillar which feeds in the interior of the fruit. The moth lays her scale-like eggs about the time the trees are in bloom, on the leaves, stem or skin of the young apple. In a few days the larvae is hatched out and proceeds to burrow into the fruit, usually into the cavity at the calyx end. After a time the affected apple falls to the ground, the worm emerges and usually finds its way to the tree, where it forms its cocoon under the bark or other shelter. Throughout the southern counties of Ontario, there are two broods in a year, but east of Toronto and north of that latitude there is usually but one brood though a small percentage may develop early and produce a second. This is a point in the life-history of the insect of very great importance, and every fruit grower should endeavor to find out whether there are two or only one brood in his own locality.

Where there is but one brood the remedy for the insect is comparatively easy. It consists in spraying the trees very thoroughly with Paris green or arsenate of lead combined with a fungicide such as commercial lime-sulphur or Bordeaux mixture immediately after the blossoms have fallen. This will ensure the destruction by the poison of the majority of the young larva. Most of those that escape can be got rid of by gathering up the fallen fruit and feeding it to pigs or burying it deeply in the ground. An easier plan is to let the pigs have the run of the orchard, and they will make away with the fallen fruit themselves.

In all that section of the country where there are two broods, it is necessary to adopt further measures in addition to the above. One plan is to spray the trees again very thoroughly about three weeks after the blossoms have fallen. An additional remedy is to bandage the trees with burlap, sacking or other coarse material. The bands should be about eight or ten inches wide and attached to the tree by a string tied tightly around the middle, leaving the top and bottom loose and fastened to a nail. The worms will go to these bandages as a convenient shelter, under which to form their cocoons. It is necessary to remove the bandages at least as often as every ten days; the larvae attached to them may be killed by passing the bandages through a clothes wringer carried on a wheelbarrow.

In addition to the treatment given above for codling moth apply the following sprayings, which also answers for scab or black spot, canker, leaf spot and other biting insects, scale insects, blister mite, psulla and slugs:

FIRST APPLICATION.—Shortly before the buds burst; use home boiled lime sulphur—20 lbs. lime, 15 lbs. sulphur, 40 gals. water; or commercial Lime Sulphur, about one gallon to 9 of water.

SECOND APPLICATION.—Just before the blossoms open use commercial Lime Sulphur, summer strength for foliage, 1 gallon to 35 or 40 of water, or Bordeaux mixture 4-4-40 with a poison.

THIRD APPLICATION.—Immediately after the blossoms have fallen, and before the calyces close use same as for second spraying.

Formulae for Bordeaux mixture:

Copper Sulphate (Bluestone)...4 lbs.
Unslaked Lime.....4 lbs.
Water .....40 gals.

Dissolve the copper sulphate in a wooden or brass vessel with hot water, pour into a barrel and add cold water to make 20 gallons; slake the lime preferably with hot water; add cold water to make us 20 gals. Stir both barrels well and pour lime into copper sulphate barrel.

Never mix concentrated milk of lime and copper sulphate solutions.

A stock solution of each may be made and kept indefinitely if not mixed. Dissolve 40 lbs. copper sulphate in 40 gals. of water by suspending just below the water in a coarse sack. Each gal. of the liquid will now contain 1 lb. of copper sulphate. Slake any desired quantity of lime and put into a box or barrel in shaded place, or sunk in the ground. Keep covered with a small amount of water to exclude the air. Calculate how much is required for 4 lbs. of lime when well stirred.

To test Bordeaux mixture, let a drop of ferro-cyanide of potassium solution fall into a little of the mixture in a saucer, when ready. If this causes it to turn reddish brown, add more lime until no change takes place.

Lime Sulphur Wash is made as follows: Home Boiled (for use on dormant wood only):

Fresh stove lime, 20 lbs.
Sulphur (flour or ffowers) 15 lbs.
Water, 40 gals.

Slake 20 lbs. of lime in about 15 gals. of boiling water in a kettle or other boiling outfit. While slaking add the 15 lbs. of sulphur made into paste by the addition of a little water. Boil vigorously, with stirring for one hour. Dilute to 40 gals. with cold or hot water. Strain and apply at once.

2.—Commercial.—This is for use either on dormant wood or on foliage. For the former use at the strength of about 1 gal. to 9 gal. of water; for the latter 1 gal. to 35 or 40 gal. of water. Dilute to 40 or 50 gal. for cherry trees.

HOW TO PROTECT GARDEN CROPS FROM INSECT PESTS

Every individual who plants garden crops should realize that many of the vegetables must be protected from the ravages of insects if satisfactory crops are to be harvested. This work, when done at the proper time, is not difficult or expensive, and neglected gardens show the necessity of systematic attention to methods of control.

The most common insects found doing damage to crops in the gardens will be mentioned and specific directions given for their control.

The Cutworm.—This destructive insect does its most serious damage to crops while it is in the larvae or worm stage. It is green or dark in color, about one inch in length, sometimes more, and in some specimens the size is as large as a lead pencil. This worm eats many of the tender plants just at the surface of the ground, apparently being satisfied after cutting the plant sufficient to cause it to fall. The most serious damage is done during the hours of the night, and in the day time it protects itself by burying itself near the surface of the soil. The most common damage is noticed on tomatoes, peppers, young beets and sweet corn. Other crops are frequently attacked by this pest.

The best control is that of the poisoned bait method, although many plants, like tomatoes, etc., may be protected by placing a piece of paper about the stem of the plant in such a way that it is protected at the surface of the ground and a little below.

The poisoned bait is made and applied as follows. This formula may be reduced to any quantity so long as the ingredients are kept i nthe same proportion: 50 lbs. common wheat bran, ½ lb. Paris green, 1 qt. molasses; add 1 lemon or 1 orange well ground, peel and all. This is enough for 2 acres.

This mixture should be first made by mixing the bran and Paris green in a dry condition, the molasses may then be added and just enough water supplied to make the whole mass into a thick dough; applying, it is always well to strew the bait in small portions along beside the row or about the hills of plants to be protected. It is best to distribute this bait in the late afternoon or early evening, that it will not become dry. The cutworms like this material better than plants, and will most always eat sufficient to kill them in great numbers if they are numerous.

The Striped Cucumber Beetle.—This beetle appears on all vine crops within a few days after they break the ground. They will kill the plants if not controlled.

Tobacco dust applied to the plants or in the vicinity of the hill will oftentimes give complete control.

The Cabbage Worm.—The eggs of the cabbage worm are deposited by a whitish moth with which we are all familiar. The eggs are fastened to the leaf of the cabbage, and the worm begins eating as soon as the egg hatches. Uncontrolled, this worm will riddle the leaves of a cabbage plant and make the produce unfit for use.

Apply arsenate of lead or Paris green directly to the plant.

The Potato Bug.—All gardeners are familiar with this pest. On small areas the beetles may be picked as soon as they appear in the spring. Hand picking is slow work, however, and the use of poison sprays gives the best control. Use arsenate of lead or Paris green.

The Squash Bug.—The big, dark-colored bug that attacks the squash is difficult to control. As they eat in groups, it is possible to control them satisfactorily by picking them off with the hand and destroying them with oil or fire.

The Cabbage Maggot.—This little maggot works on the root and stem of the cabbage, eating on the inside until the strength of the plant is exhausted. The losses from this insect are great.

The best means of control for the home garden is to place small disks of tarred paper about the plant at the surface of the ground. The disks may

be cut in any shape and a slit cut to the center to allow the stem to slide through when it is put into place. This means of control prevents the fly from laying the egg.

There are many more troublesome insects of less importance, which space prevents mentioning at this time. Each individual must watch with care for evidence of trouble, and take immediate steps to control. Most of the insect pests may be controlled with ease by making early attacks or exercising preventive methods.

POINTS ON COLD STORING FRUIT

Apples should be stored as soon as possible after they have been packed. The apple is an organism and, like every other living thing, it has its definite length of life. During its growing period the apple stores within itself food material that is capable of preserving its life for a considerable length of time after its removal from the tree. These food products are mainly starches and sugars, and by the chemical changes which occur in the apple during the ripening process the starches are changed into sugars and the sugars gradually break up into simpler compounds. It has been found that a cold temperature will slow down the chemical changes. The object of cold storage is therefore to postpone the final breakdown or death of the fruit by checking these developing processes. It is a well-known law that with each increase of 18°F. the rapidity with which chemical changes take place is increased from two to three times, or applying this to fruit storage, at 50° temperature the chemical changes which ultimately result in the death of the fruit would occur at least twice as rapidly as at 32°. Thus the conclusion to be drawn is plainly that the lowest temperature at which the fruit can be held without danger of freezing is the one most favorable to its length of storage life. Fruit has been placed by the Department of Agriculture in cold storage, part held at 32° and part as 35°, and the results were briefly as follows: The first two inspections, in January and February, showed very little difference in the amount of scald or decay in normally good-keeping apples held at the two temperatures. However, at the third and fourth inspections, made toward the end of their storage life, the fruit held at 35° showed considerably more decay than that stored at 32°. In apples with a shorter storage life the differences were shown even in the first two inspections. These results are additional proof to the effect that low temperatures retard the ripening processes, and that as these processes are quickened by higher temperatures the life of the fruit is shortened and its susceptibility to disease increases.

Even after many years of successful cold storage of apples many persons cling to the belief that cold-storage apples will not keep as well upon removal as apples that are held throughout at a higher temperature. The Department investigations give very conclusive evidence that this opinion is eroneous. Apples from the same lot, placed in and removed from cold and common stages at the same time and held after removal under similar conditions, practically always favor the lower temperature, especially if removed fairly late in the storage season. Apples held in common storage are usually removed by January or February, while those in cold storage are often kept considerably later. People are apt to compare storage early in the season with those taken from cold storage a good deal later, and this is obviously unfair. Apples held in any kind of storage until they are overripe will undoubtedly deteriorate very rapidly upon withdrawal to a warm temperature. Just as cold retards ripening in storage, a cool temperature is best for fruit when held for any length of time after its removal from storage.

Many growers are interested in the problem of providing local storage space for their apples. In spite of what has been said regarding the effects of temperatures higher than 32°, it is not always practicable to build a cold storage house. Cold storage warehouses represent a large amount of capital in building and equipment, and also require a large operating capital. Some communities are justified in raising funds for a cold storage plant, but many are not. It is nearly always possible, however, for a small community, a group of growers, or even one large grower, to build a common or air-cooled storage house that will satisfactorily provide for their necessities. A common storage house of very large capacity may be built for six or eight thousand dollars with slight operating expenses, as against fifty or a hundred thousand dollars and larye running expenses for a cold storage plant. Many common storage houses have already been built in various sections of the northwest, and the Department of Agriculture has inspected many of them, held their fruit in several of them in the past, and has this season originated more extensive work with this type of storage.

Two essentials to be secured in the construction of a storage house are good insulation and an effeltive system of ventilation. Both of these are of utmost importance. A building must be well insulated to maintain a uniform temperature, and this is necessary if the fruit is to keep satisfactorily for any length of time. Even the briefest consideration of the details of construction and materials necessary to secure proper insulation would exceed the limits of my space, but it is highly important that the common storage be constructed to permit the minimum passage of heat or cold through its walls.

Ventilation is the next important consideration, and this may be achieved by simple air shafts, or more complicated systems, employing electric fans in the shafts. It is essential that outside air should not be admitted to the storage house when it is warmer than the air within the house.

Uniformity of temperature is a most important consideration in a common storage house. It is better to hold the fruit at 40° than to pring it down to 32° at night and allow it to jump up to 45° during the day. During the early part of the season the temperature in a common storage house will probably remain relatively high, especially if cold nights are none too plentiful. The daily receipts of warm fruit prevent the lowering of the temperature at a very rapid rate during the harvesting season. Fruit picked during the day and stored while still warm carries a large quantity of heat with it into the storage room, and when the boxes are stacked considerable time is required to reduce them to the temperature that they would reach if simply left in the orchard over night. After all of the fruit has been received it is a rather simple matter to reduce and hold the temperature at the point desired. Thirty-five degrees is about as low a temperature as most of the common storage houses maintain, but in some cases 32° is reached and held. In either case the length of time in the fall during which the fruit is held at a high temperature shows itself in the shortened life of the fruit. Early in its storage life an apple will show as little decay in common as in cold storage, but toward the middle of its storage life the difference becomes quite marked. In short, common storage may be as satisfactory as cold storage for fruit that is only to be kept until about the middle of the winter. Fruit to be held for longer periods should be placed in cold storage.

It seems entirely feasible to divide a common storage house into various compartments, each of which could be filled with fruit as rapidly as possible, and then held at a uniform temperature. This would render the common storage more nearly as efficient as the cold storage, but until some such plan has been worked out the preceding statement must hold.

PROTECTION OF CROPS

Crop protection means crop production. Canada loses over one hundred million dollars worth of her staple crops every year through the depredations of insect pests. A large portion of this loss could be prevented. As we cannot afford to lose the smallest portion of our grain and other food crops during the present critical period when the production of food is of supreme importance, the Dominion Department of Agriculture is making every effort to prevent, as far as possible, losses due to insect pests. Crop protection must go hand in hand with crop production.

Insect pests are not usually noticed or reported until they have caused considerable damage. Therefore it is urged that the closest watch be kept on all crops for the first appearance of any insect pests or damage. Immediately such damage is observed steps should be taken to control the outbreak in its incipient stage. If the pest or the method of control is unknown, specimens of the insect and its injuries should be sent at once to the

(Continued on page 545)

A Mower You'll Like

WHEN you come to buy your new mower this year, take a good look at the features of the **McCormick No. 6.**

Rough, stony, or stumpy ground has no terrors for the driver of a **McCormick No. 6,** because the floating cutter bar can be lifted quickly and easily, and fully twice as high as on other mowers, and as quickly and surely dropped again. No mower ever had a cutter bar that lifted so high without throwing the machine out of gear. The cutter bar weight is carried from the trucks, where it keeps both wheels hugging the ground, increases the tractive power, and lightens the draft of the machine. The bar itself is strengthened in two ways: At the butt it is a full half inch wider than the average bar, and it is heat treated throughout, like an automobile part, making an extremely tough, strong and rigid bar which gives a clean shear cut from one end to the other. The new **McCormick** mower is made in all desirable sizes.

McCormick rakes, tedders, International side delivery rakes, loaders, and hay presses are machines you are perfectly safe in buying. Write the nearest branch house for catalogues.

DAIRYING.

NEW FACTS REGARDING FOOD VALUE OF BUTTER FAT

By J. H. Frandsen, Nebraska Agricultural College

There has been an idea prevalent among dietists and chemists as well as people in general, that fats, regardless of their source, yielded only energy and heat when consumed by the animal or human body, and until very recently no chemical or dietetic experiments had shown any really important difference between butter fat and other fats. It had, of course, been proved that fats of low melting point were more digestible than those of a high melting point. Aside from this, there was thought to be but little difference in their food value. In the estimation of many, "fat was fat" and yielded only energy and heat.

Theoleomargarine people often took advantage of this fact to exploit a cheap product as a substitute for butter. Whether or not this is just as good or better product is all well and of the place they claim for it has always been seriously questioned by dairy and creamery men. In this connection experiments carried on by E. B. Osborne, of the Connecticut Experiment Station, Dr. Mendel, of Yale, and E. V. McCollum, of the Wisconsin Experiment Station, are peculiarly interesting and more beyond doubt show the real value of butter, viz., that butter fat not only yields energy and heat as do other fats, but that it contains something more vital than other fats—a principle which, like proteids, supplies the elements necessary for growth and life itself.

In experiments carried on with white rats, young rats were fed mixtures composed of chemically pure protein, starch, fat, sugar and various salts, and got along splendidly for the first three months, then they lost appetite, fell off in growth and finally starved. After numerous repitions of this nature the investigators found that when milk was added to the ration the little animals began to regain normal condition, to thrive and grow to maturity. Many changes were made in their diet to make it more palatable, changes in salts used, the kinds and amounts of sugar, etc., but always the same result—growth ceased at the age of about four months. It was in an attempt to increase the palatability of the diet by substituting pure butter fat for the lard, which had been used as the fat in the ration that the experimenters found these new facts for the little animals immediately began to grow just as when milk was fed. It was evident that butter fat supplied something necessary for growth which lard could not supply. Other experiments were carried on to determine whether other fats from the animal or vegetable kingdom would produce the same effect as had butter fat. Experiments with tallow, olive oil, corn oil, cottonseed oil and peanut oil proved futile, while the fat of eggs and fat extracted from the cells of pig's kidney produced the same result as did butter fat. This it seems evident that the fats obtained from the living protoplasm of the animal have this quality of inducing growth other fats have ceased. This far no known fat has been found to possess this power.

Experiments with pigs and calves gave results similar to those obtained with rats. No records of experiments on man were available, it is reasonable to suppose that results fully as striking would be obtained. In this connection the editor of Hoard's Dairyman recalls two instances within two months, institutions had, in addition to a liberal allowance of milk, substituted oleomargarine for butter in the dietary of the inmates. It was noted that when oleo was used the inmates were not in as good physical condition and that physicians were in greater demand than before. When oleo was replaced with butter it was reported that the health of the inmates was materially improved.

In the light of these experiments and observations it is reasonable to suppose that even more marked discrepancies would be apparent in the growth and general health of young children.

Just how much or how little butter can be used and still maintain normal growth has not been determined but enough has been proved to give the dairyman sure footing in declaring butter fat is a better food than butter substitutes composed of vegetable fats and oils. Facts and figures like these make it most embarrasing for the oleo manufacturer to claim hereafter that he has a "just as good as butter" article, and surely it behooves the housewife to give the most careful consideration to the results of these recent investigations and the conclusions which may logically be drawn from them, before she decides to eliminate butter from the diet of her family.

LEGUMES AS A DAIRY FEED

More legumes mean less protein concentrates in the dairy cow's ration. This fact is worthy of serious consideration by dairymen in these days of unheard-of prices for bran, linseed meal, cottonseed meal, and other protein feeds that many be used to complete the grain protein of a cow's ration.

Consider the value of clover hay. This legume, together with corn silage, furnishes a ration that will maintain cows in reasonably good condition and enable them to produce a fairly large flow of milk. It would not, however, be advisable to feed such a ration continuously, nor to feed it to cows that are expected to make high records.

Besides clover, the two other legumes that may easily be grown are soy beans and field peas. The surprisingly large amount of protein contained in these is shown in the accompanying table:

Digestible Nutrients in 100 Pounds

	Protein	Carbohydrates	Fat
Wheat bran	12.5	41.6	3.0
Alfalfa hay	10.6	39.0	0.9
Red clover hay	7.6	39.3	1.8
Field pea hay	12.2	40.1	1.9
Soy bean hay	11.7	39.2	1.2

Given for comparison.

Clover hay is one of the best roughages that can be grown for dairy cows and compares very favorably with alfalfa. If a liberal amount of clover hay is used in the ration of cows of moderate producing capacity, there is no reason why the concentrate part of the ration cannot be cut down by nearly one-half.

Soy bean hay has been found to have about the same feeding value as alfalfa or clover hay. This being the case, nothing more need be said to emphasize the value of soy beans as a roughage.

Cut when the soy bean can be cut for hay is the best time for silage. Usually, however, they should be used to improve the quality of silage by cutting them into the silo at the rate of one ton beans to two or three of corn. They can also be used for soiling purposes. The Canada field pea may be grown for hay or used as a soiling crop. If sown with oats, and the crop cut as hay, a roughage is had which is fairly high in protein. As in the case of clover or soy bean hay, the use of field peas grown alone or with oats will reduce the amount of grain necessary. When properly handled, oats and peas make excellent silage.

Doubtless some dairymen are tempted to reduce too much the amount of feed given to their cows, and especially the amount given to their young stock. These men should remember that it will pay to feed liberally enough to keep the future herd in growing condition. Not only will more legumes decrease the cost of keeping a herd of dairy cows, but such feed will insure best maintenance of the young stock which will be the herd when the present era of high prices is past.

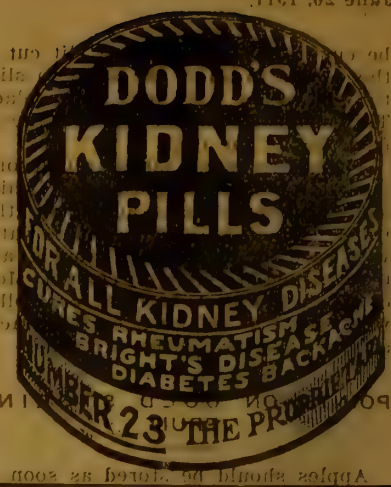
Red clover can be seeded in several ways: 1, early in the spring without a nurse crop; 2, in the spring with oats, oats and peas or some other spring sown grain. The rate of seeding is 15 pounds per acre alone, or if the soil is low and wet 10 pounds, with four pounds alsike clover. Timothy or timothy and redtop may be included in this seeding.

Soy beans are seeded alone in rows 30 inches apart or mixed with corn in the same rows for silage. For hay they are usually drilled solid. One half bushel alone, mixed two quarts of corn to one of beans, or 1½ bushels per acre drilled solid, is the usual rate of seeding. Soy beans should be inoculated where grown for the first time on a soil.

Field peas are mixed thoroughly with oats before planting, at the rate of one bushel peas to 1½ bushels oats. This is about the proper amount per acre where a young catch is seeded at the same time. Legumes are easy crops to grow. They not only increase the amount of home-grown protein, but they also add nitrogen to the soils of the farm.

ESSENTIALS FOR GOOD BUTTER

The first thing to remember if one wants to make good butter at all times, is that one must have a system to go by; do not make butter by "guess." It should not be necessary to state that "cleanliness" should be the watch word all through the process of butter making, beginning at the milk pail. Dirt and specks in the milk and cream will make "off" flavors in the butter. While good butter can be made by separating the cream from the milk by the "shallow-pan" way, to have a uniform article each churning, it is certainly better to be cooled before it is mixed with the cream that has been collected. The cream should be kept in a cold place and where it is free from any strong odors; cream should not be stored in the family general-purpose ice-chest, as it is apt to get "off" tastes and smells, from strong-smelling foods. To make nice butter, churning should be done at least twice a week, three times would be better; cream kept too long has a stale taste to the butter made from it. When one is ready to churn, the cream should be weighed, and the amount of butter that is produced from it ought to be remembered and the amount of cream that it takes to make a pound of butter noticed, so that future churnings can be controlled systematically, especially when the salt is to be added. It



DALHOUSIE UNIVERSITY

Valuable New Scholarships

New Entrance Scholarships
Three of $200 each
Five of $100 each
Tenable for one year and to be competed for at the Matriculation examination, held on September 25th to 29th, 1917.

New Senior Scholarships
Three of $200 each
Tenable for the second year of a course for an Arts or Science degree and offered in competition in the coming session 1917-18 to undergraduates completing the first year of their course.

Courses Leading to Degrees
are offered in Arts, Science, Music, Pharmacy, Law, Medicine and Dentistry. Preliminary courses in Engineering.

Lectures in all Faculties begin on October 2, 1917.
